

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

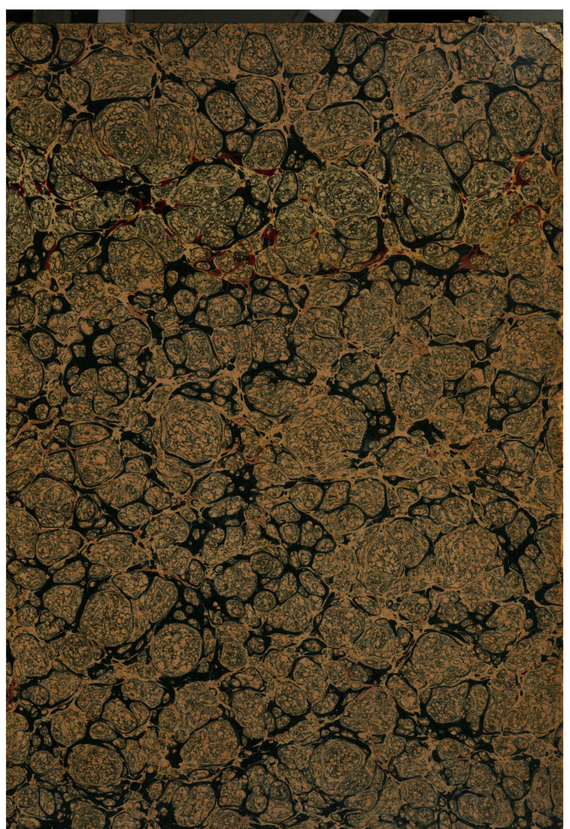
Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.



+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

The Hartford Perfected Dunlop Tire.

Paris, July 28, '05.

Dear Sirs:-

We have arrived in Paris coming over the Route Nationale from Aix les Bains via Lyons and Nevers. The roads were exceedingly trying, very hard and a lot of "pave" or cobblestones. I had two punctures. These were the only mishaps in 2136 miles and the tires have stood the hard work without showing any other signs of wear and tear. People here consider this a very good record as many of the best foreign tires blow out from the heat.

Yours truly,

Walter Hale

What You Get For Your Money

is more important than the price you pay.

That is one reason why our cars are so often referred to as

"Those Remarkable Mitchells"

MITCHELL LIGHT CAR, $750.

MITCHELL TOURING CAR, $1500.

They set up a new standard in price values.

At $750 and $1200 there is nothing that even begins to approach them.

Have you ever taken the trouble to "look into" the matter?

A Frank Talk With Auto Owners?

Every automobilist has a right to be a crank about his tires.

There is no more reason why he should accept any make of tire than that he should buy the first car he sees.

The price of a whistle always carries with it the privilege of selecting your whistle.

Ditto auto tires.

You know and we know that tires have a heap to do with making any automobile as serviceable as it should be.

Put indifferent tires on the best car made and the chances are that farmers will tow you farther than your motors will propel you, and that the repair man will be as much in demand as your chauffeur.

Good tires are the real secret back of most of the successful trips you have made.

A really good tire is not only an economy in itself but does more to neutralize the wear on other parts of the machine than is generally supposed.

Take care in selecting your tires and your tires will help you take care of your car.

Morgan & Wright tires are good tires for the automobilist, because they give an exceptional amount of sustained service.

As one user puts it: "They don't chum much with the repair shop."

They are long-lived, ultra-serviceable tires, and are known to be such by those who use them.

(Be a crank.) Insist upon Morgan & Wright tires.

Satisfaction and the OLDSMOBILE

We have been telling you why the Oldsmobile is always safe under all circumstances and for any member of your family.

The same features have to do with the complete satisfaction every Oldsmobile owner gets from his machine—which having been bought in the first place at a reasonable price, is found to be economical to maintain and thoroughly dependable in every part. Let us repeat the features:

Two Brakes.
Large Parts.
Strong Springs.
Heavy Spindles and Wheels.
Analyzed Material.
Severe Construction Tests.
Unbreakable Steering Connections.
Simple Operation.

We want especially to emphasize simplicity of operation. There are more ladies driving the Oldsmobile in this country than any other make of automobile. The clutches are easily handled. The control is free from complication, and the brakes are strongly connected and easily operated. If you will write us we will gladly set before you more of the convincing reasons as to the desirablity of these cars. If your will call on our nearest sales agent, you can arrange for a demonstration. Send for Catalogue 53.

A Few Words to the Automobile Agent

¶ If your Agency arrangements during the past year have been satisfactory, do not make any change.

¶ We don't believe in changing Agencies unless there is a good reason. Naturally, we desire to get in touch with the best men in the business as we want the strongest sales organization we can get for the WAYNE cars.

¶ There are two ways for a manufacturer to obtain his Agents. One is to have a high-priced sales manager—an entertaining gentleman of fine address who can go out and make contracts irrespective of the actual merits of the car. The other method is the "show me" method, where the manufacturer gets down to "brass tacks" and makes his Agency arrangements based upon the actual merits of his car and by giving the Agent a fair and square deal all around. The Wayne cars have won a foremost place among American Automobiles by actual merit, and the Wayne Automobile Company has made rapid strides to the front.

¶ Last year we spent upwards of **$50,000** in judiciously advertising our Cars. This year we are going to do even more advertising and the Agent who takes the Wayne car now is going to get the benefit from this publicity and is going to get the hearty co-operation of the factory as well.

¶ We have perfected arrangements for early and prompt delivery of our **1906** models because we want to be in a position to carry out the "show me" policy and to live up to our Agency arrangements.

¶ We have the cars, gentlemen, we have the facilities for manufacturing and for making deliveries, and we are going to do our full share in thoroughly advertising the Wayne cars. Now, we want to get our **1906** Agency arrangements closed and then we are all in shape to make money. Will you write us about the Wayne representation in your territory today?

WAYNE AUTOMOBILE CO., Dept. Q, DETROIT, MICH.

Digitized by Google

DON'T EXPERIMENT
Just Sell
THE FORD

Mr. Agent:—Over 2,000 Automobile buyers decided during the past season not to experiment. They all bought "Fords." It is even more important for the retailer to *sell* a car of known merit than it is for the purchaser to *buy* one. The buyer only loses his *money*, but the agent who sells a car not up to standard loses both *prestige* and *reputation*.

The success of the Ford Motor Co. is built on the success of the Ford Cars, and you know how great our success has been. Remember that people like to do business with successful firms, and a *car with a reputation is easier to sell than an unknown.*

You know the general rush to the Ford exhibit at the shows, and how they all ask, *"What has Ford this year?"* plainly indicating that automobile men look to Henry Ford for new ideas and originality of design.

We have a surprise or two up our sleeve this year—particulars about October 15th—nothing before, except that there is certainly good business ahead for the Ford agent in 1906, and it might be well to write us and see if we can give you the proposition and the territory you require.

TANNER & COMPANY,

AUTOMOBILES, MOTOR CYCLES, BICYCLES AND SEWING MACHINES.

NEW BEDFORD, MASS., September 2, 1905.

E. R. THOMAS MOTOR CO.,
Buffalo, N. Y.

Gentlemen:—Last October I purchased a 24 horse power Thomas Flyer from a Boston owner, who told me that it had been driven 10,000 miles during 1904. Since owning this car I have covered 21,000 miles in it personally, getting over $1700.00 from renting the same, and the machine seems smoother running to-day than ever.

I have carried six and seven people in it many times on trips forty and fifty miles. Better service could not be asked or given.

Yours very truly,
WM. E. TANNER.

COMMONWEALTH OF MASS.

Find an Elmore agent or user and you'll find a two-cycle engine enthusiast. The fame of the two-cycle idea has spread this season from ocean to ocean. Its principle—a continuous application of power—is irresistible and indisputable; and that principle is put into practice with absolutely perfect success in

THE TWO-CYCLE ELMORE

Pictnre to yourself two men—one trying to cover the ground in long, hard jumps, the other forging ahead in quick, short steps. The first is the four-cycle—and bound to lose against the two-cycle with its even steady gait. We have a book called "A Long Jump or Two Short Steps," which explains this in A B C style.

Better still, we have a record of victories in every test worthy of the name. Better still, we have the every-day testimony of thousands of users to which you can easily refer.

The Elmore two-cycle engine is no longer the "coming" engine—it is here. You'd better join the army of enthusiastic converts. Ask your agent or write to us.

Haynes Quality Qualified in the Vanderbilt Cup Trials.

The HAYNES 1906 four cylinder REGULAR STOCK TOURING CAR qualified for the Vanderbilt Cup Race in competition with a long list of the most powerful specially-constructed racing cars ever built in America.

Compare the cylinder capacity of the engine in the HAYNES car (5-inch bore x 6-inch stroke) with that of all other entrants. Nutt had been around the course in this car only three times prior to the race and was the only contestant who had never before driven in a race. The only stop he made with the HAYNES car was necessitated by an oil can bouncing into the fly wheel and spilling oil on the master clutch, causing it to slip.

Just think what it means for a stock touring car to win honors from specially built monster racing cars. That is what THE HAYNES STOCK CAR did. IF YOU ORDER A HAYNES 1906 TOURING CAR, YOU GET AN EXACT DUPLICATE OF THE CAR DRIVEN IN THIS CONTEST.

We are now booking orders and closing agencies for 1906 HAYNES CARS. Write to-day.

The Incomparable WHITE

The Car for Service.

THE WHITE LIMOUSINE

The quality of absolute noiselessness of operation is particularly desirable in a limousine, because in any car with a closed body the noise made by the mechanism is much more noticeable and annoying than in an open vehicle.

Another desirable feature of a limousine is that its speeds respond instantly to the throttle, in order that it may be guided safely and speedily through the crowded city streets.

Both these qualities (inherent in the use of steam power) the White limousine possesses in unique degree. As regards the graceful lines and luxuriousness of equipment and finish, the White limousine must be seen to be appreciated.

Write for further details, regarding price, etc.

GOODRICH AGAIN!

Another remarkable record made on

GOODRICH TIRES

San Francisco to Los Angeles in 21 hours and the return trip in 20 hours.

No occasion to touch the tires—and the treads looking just like new. The advantages of the Integral Construction and Goodrich rubber on the treads are in evidence everywhere.

WHITE SEWING MACHINE COMPANY
OFFICE: 1878 MARKET STREET.

San Francisco, Cal., August 16, 1905.

Gorham Rubber Co., San Francisco, Cal.

Gentlemen:—Replying to your letter making inquiry with reference to the tires used by Mr. Geo. A. Hensley when he broke the San Francisco-Los Angeles records two weeks ago, beg to state that they were the regular stock Goodrich tires 34 x 4 inches and had been used before this trip for sixty days by Mr. Hensley as they were the original ones that were on his car when he bought it with the exception of one tire, which was changed before the start as a matter of precaution and a new Goodrich casing put on.

Mr. Hensley made the run in the remarkable lapse of time of 21 hours and 12 minutes from San Francisco to Los Angeles, and on the return trip his running time was 20 hours.

Since that time Mr. Hensley has run his car two weeks and up to date has never had occasion to use a pump on any of his tires, and the tread shows hardly a scratch. This is certainly remarkably good work for tires, and I congratulate both yourselves and the B. F. Goodrich Co. upon the uniform quality of the Goodrich tires we have received on the coast this year.

Yours very truly, (Signed) C. H. HAWKINS, Mgr.

GAS-AU-LEC

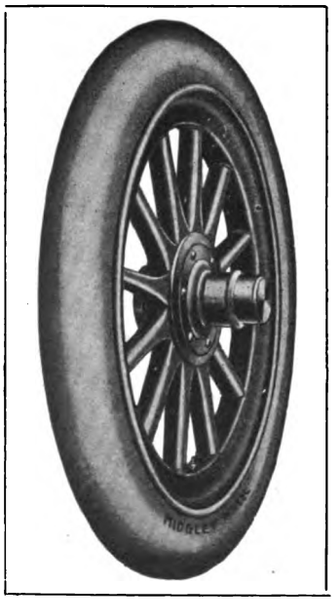
"THE SIMPLE CAR"

Elegant in Finish.

Luxurious in Appointments.

Built by Skilled Workmen from the Best Materials Obtainable.

THE SIMPLEST GASOLENE CAR IN THE WORLD



both as to construction and control and the easiest to operate and maintain.

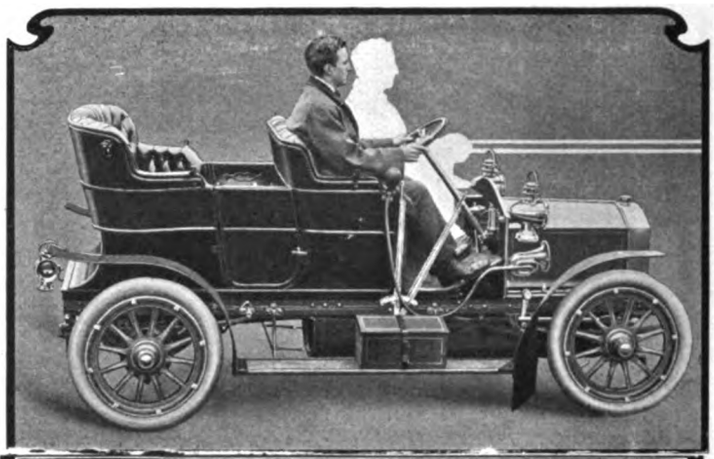
"Marks a New Era in Automobile Construction."

40 45 Horse-Power $5,000.

CORWIN MANUFACTURING COMPANY,
Peabody. Mass., U. S. A.

MIDGLEY
Artillery Pressed Steel Wheel
IS
THE STRONGEST AUTOMOBILE WHEEL MADE.

THE ONLY WHEEL that will always remain absolutely true.



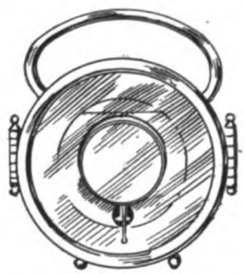
THE ONLY WHEEL that does not require care and attention.

THE ONLY WHEEL that will withstand hard usage, even abuse.

THE ONLY WHEEL that will not shrink, warp or swell, thereby eliminating resetting rims and other annoyances.

Write for Catalogue.

THE MIDGLEY MFG. CO., Columbus, Ohio



The New AUTOCAR Control
Simple As a Pair of Reins

The control of Type XI Autocar brings automobile driving to the simplicity of horse driving. In the rim of the steering wheel, and forming parts of it, are set two grips, one at the right hand, one at the left. These two grips control the throttle and the spark, regulating the speed of the car from 3 to 35 miles an hour. This arrangement brings the steering and the speed regulating together, so that in all ordinary running the only position necessary for the hands is on the steering wheel.

To be sure this car has a gear shift lever and an emergency brake lever at the right of the driver. The gear shift lever, however, is needed only on particularly hard hills or very bad bits of road. The car loaded with four passengers will climb nearly all hills on the high gear. The foot brakes being ample for all ordinary use, the emergency brake is rarely required. Hence we say that except in extreme cases only one position is required of the hands in driving Type XI Autocar.

This car has four cylinder verticle motor of 16-20 horse power, double side-entrance tonneau, and the smartest lines of any car. It is extremely quiet and vibrationless in running while having great power in proportion to its weight. Type XI Autocar is the ideal car for the man who wants an up-to-date, powerful, four-passenger car without excessive weight. The price of Type XI is $2000. Catalogue giving full description of it and also of Type X Runabout $900, and Type VIII Tonneau $1400, together with name of dealer nearest you, sent free upon request.

THE AUTOCAR COMPANY, Ardmore, Pa.
Member Association Licensed Automobile Manufacturers.

The absolute best in Motor Lamps

THIS
SOLAR PARABOLENS HEADLIGHT

throws most powerful beam of any lamp made, yet burns cool. Simple, safe and sure, no better lamp can be built. The most your dealer will say about the next best is that it is "just as good as a SOLAR"—but why not buy the **standard** and dodge the second best

We stand back of every SOLAR lamp with a guarantee to **you**—a warranty that leaves no room for risk on the buyer's part. You can't buy better lamps—whether oil or acetylene.

MICHELIN TIRES

SIMPLY CAN'T HELP WINNING

THE FOLLOWING LETTER FROM MICHELIN ET CIE IS REPRODUCED FROM L'AUTO OF PARIS, FRANCE.

PYRENEES CUP.

Finding that the winning of this cup would not be of great importance for a tire (1,423 kilometres at touring speed with controls, hills and various coefficients), I made no effort to achieve it. They tell me, nevertheless, that I am the true winner: Sorel in the DeDietrich took the cup.

I also won the prize of the city of Toulouse (La Diane, of Falguiere) and the Dunlop Trophy (La Renommee, a brass by Barras).

No one even pretends that according to the strict interpretation of the rules (page 45), I could have gained the Dunlop Trophy.

I take pleasure in giving my friends and acquaintances their dues, but without taking to myself any great amount of glory.

(Signed) MICHELIN.

N. B.—I read in an advertisement that in winning the 6th class, Baron Henri de Rothschild (Mercedes) used tires of a rival make.

I inisist upon correcting this assertion: The car started equipped with tires of another make, but finished with a pair of Michelin's on the rear wheels which had been purchased at Saint-Gaudens.

OTHERS CLAIM. MICHELIN DOES.

Michelin is Truly the Tire of Achievement.

A 20455

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, September 28, 1905. No 1

A. C. A. SHAW IS SANCTIONED

Club Takes Action to Relieve the Situation—Funny Statement of Reasons.

Sanction for the so-called "independent" show, the one promoted by the Automobile Club of America, and which will be held in the Sixty-ninth Regiment Armory, New York, finally has been issued by the National Association of Automobile Manufacturers. The Motor World last week indicated that such a state of affairs would come to pass and a disturbing factor in the show situation be thereby eliminated.

Without a sanction, all who exhibited at the A. C. of A. show would have been placed in the attitude of "outlaws," and thereby made ineligible to exhibit at the Chicago show or any of the local functions sanctioned by the N. A. A. M. The clubmen did not relish applying for a sanction, but the pressure brought to bear on them by intending exhibitors was too strong to be resisted.

Accordingly, the club applied for a sanction, and on Monday officially announced that one had been obtained. The announcement explained that the sanction was secured "in order to avoid embarrassment to several prominent exhibitors in relation to shows in other cities," and as "the sanction does not interfere is any manner with the open character of the Automobile Club show, its exhibition committee, having in view the general good of the industry, decided that it would be unfair to N. A. A. M. members to ask them to place themselves in bad standing with their own organization."

Black Diamond Officials in Trouble.

The troubles of the embarrassed Black Diamond Automobile Co., Utica, N. Y., are following its sponsors. Transcript of a judgment for $36,201 from Oneida County was filed in New York City on Monday, 25th inst., against Charles E. Turner, a promoter, of 27 William street, and A. Vedder Brower, of Utica. The Sheriff received recently two executions against them aggregating $15,513 in favor of the Utica City National Bank, but could find no property to levy upon. Turner was vice-president and general manager of the Black Diamond Co. and Brower was treasurer. This company was incorporated on April 10, 1903, with a capital stock of $500,000, and a petition in bankruptcy was filed against it on July 25 last at Utica.

Stoddard-Dayton to Enter New York.

The Stoddard-Dayton agency, which was incorporated last week with a capital of $10,000, will open a New York office and garage at 1853 Broadway. They are already showing the new 1906 four-cylinder 35 H. P. Stoddard-Dayton, which is listed at $2,250. C. H. Hill, who is the general manager, has had considerable experience in the handling of motors and accessories throughout the East. He is assisted by James McIlvrid. The agency controls the territory included in the metropolitan district and New York State as far north as Poughkeepsie; also all of Long Island and New Jersey, and Fairfield and New Haven counties, Conn.

Olds Changes New York Agency.

The Olds agency in New York City, heretofore possessed by the Harrolds Motor Car Co., has been taken over by the Oldsmobile Co., of New York, a new company formed by General J. T. Cutting, formerly the head of the Cadillac Co., of New York. The new concern has established itself at 1653 Broadway in the store formerly occupied by F. A. Sanford, the Yale agent, who has retired from business.

Omaha Building a Factory.

The Karbach Automobile Co., which was organized recently in Omaha, Neb., for the express purpose of manufacturing motor cars, is erecting a three story brick building, 22 by 60 feet, at Thirteenth and Howard streets, to cost about $10,000. The new company expects to have its cars, which "will embody new features," on the market by spring.

Baker Trebles its Capital.

The Baker Motor Vehicle Co., Cleveland, has again increased its capital stock—this time from $400,000 to $1,250,000.

INCREASING THE MEMBERSHIP

Motor and Accessory Manufacturers Add to Their List—Preparing to Allot Show Space.

Every director save one was present at the meeting of the Motor and Accessory Manufacturers, which occurred in Syracuse, N. Y., on Friday last, 22d inst. Nothing of moment transpired, however, the appointment of a committee to allot show space and the election of nine new members constituting the chief proceedings. The additions to the roll, which brings up the total membership to 116, are as follows:

Motor Car Specialty Co., Trenton, N. J.; Edmunds & Jones Mfg. Co., Detroit, Mich.; Atwood Mfg. Co., Amesbury, Mass.; Bryant Steel Wheel and Rim Co., Columbus, Ohio; the Garford Co., Elyria, Ohio; W. K. Prudden, Lansing, Mich.; Eastern Carbon Co., Jersey City, N. J.; Schwarz Wheel Co., Philadelphia, Penn., and Connecticut Telephone and Electric Co., Meriden, Conn.

After the business meeting the directors were entertained by the Brown-Lipe Gear Co. at a luncheon at the Yates Hotel, following which was an automobile drive to South Bay, Oneida Lake. The visitors remained at the Sagamore Inn over night. It was planned to have a shore dinner on Frenchman's Island, but owing to a gale of wind which made the lake too rough for comfort, the trip was abandoned and the dinner was held at the hotel. The members then returned to Syracuse in automobiles. The next meeting is to be held in Boston during the second week of November.

Midgley in Hartford Rubber.

At a meeting of the directors of the Hartford Rubber Works Co. last week, Thomas Midgley was elected first vice-president, and will henceforth take an active part in the company's affairs. Mr. Midgley, who has been supplying steel rims to the Hartford people, took up his residence in that city several months since, whilst still retaining his steel wheel and steel rim business in Columbus, Ohio.

FOREIGN METHODS INFERIOR

Bearings Made in Europe Not as Good as the American—An Expert's Opinion.

R. H. Grant, superintendent of the Standard Roller Bearing Company, Philadelphia, has just returned from an extensive tour of England, France and Germany, where he visited all the principal factories devoted to making automobiles, automobile axles, steel balls and ball bearings. He delved deeply into their methods of making automobile axles, devoting special attention to the Lamoine factory in Paris, the most notable in Europe. A thorough examination was made of their systems of forging, welding asd hardening, the latter being very different from anything used in the United States.

The use of annular ball bearings is very extensive on many makes of foreign automobiles, and Mr. Grant interested himself in the steels used and the processes of hardening and grinding the bearings. As a result he gives as his opinion that the foreign methods of manufacture are much inferior to those used in the United States, both in making and in finishing the bearings, although the Standard Roller Bearing Company will arrange to continue to use much foreign steel for making annular bearings and other products. For a short time, the foreign companies used springs between the balls, to produce a silent type of annular bearing, but this has been discarded, as it proved weak and defective in actual operation. In addition to the full type of annular bearing, consisting of rings filled with balls, a bronze cage or spacer has been used to contain the balls, similar to that made by the Standard Roller Bearing Company for this purpose. The use of a small section of the ring, set in place, and held by a screw, to permit insertion of the balls, allowing the head of the screw to project, has also been discarded, as the loose section, or screw, falls out of place, asd breaks the bearing.

The Standard Roller Bearing Company has secured several large contracts for shipment to European concerns, which shows that the foreign trade is open to the American product, when they are shown that the workmanship is equal if not superior to that which they themselves are making.

Coey Plans Model Garage.

In the new garage which C. A. Coey & Co., the Thomas agents in Chicago, are erecting on Indiana avenue, near Sixteenth street, some new ideas will be installed. The building will be 114 by 170 feet, which Mr. Coey thinks will make it rank as the largest garage in America. There will be a washer for and a wash rack under each car, so that when a car is driven into its locker at night there will be no necessity for moving it until the owner desires again to use it. Only the washer, polisher and chauffeur will have keys to the locker, and the time of each arrival and departure will be recorded. In addition to this garage, Coey & Co. are erecting a two-story salesroom, 50 by 170 feet, at Michigan avenue and Fourteenth street. This firm sold 103 Thomas cars this season, and have placed an order for 200 of them for 1906.

Haynes Starts on Tour of States.

What should prove a profitable form of publicity is now being undertaken by the builders of the Haynes. With J. W. Haynes at the wheel of one of their regular 50-horse power touring cars, of the type which qualified in the Vanderbilt eliminating trial, a start was made from Kokomo, Ind., the home town, on the 19th inst.

With at least one full day's stop in each city in which to visit the Haynes agency and make the acquaintance of prospective buyers by putting the car through its paces for their benefit, the route will follow the comparatively straight line marked out by the New York Central Railroad, stopping at Cleveland, Buffalo, Rochester, Syracuse and Albany, then into Massachusetts, with stops at Springfield, Worcester and Boston, and from there to New York by way of Providence, Hartford, New Haven and Bridgeport. A strike south will be made after leaving New York, in order to take in Philadelphia, Baltimore and Washington. From there a return will be made direct to New York in order to take in the Vanderbilt race, after which the publicity tour will be extended to the Pacific Coast, probably ending up in San Francisco.

The entire trip is being undertaken purely for business, and no attempt at speed or record making will be tried on the way to the coast. Progress will, in fact, depend upon the state of the weather as much as anything else.

In the Retail World.

Work has been begun on the new garage for the Letcher Automobile Co., in San Jose, Cal. It will cost about $10,000.

Pearl S. Bradford, the Newburyport (Mass.) dealer, intends to expand before stocking his 1906 models. Accordingly, another story will be added to his Liberty street garage.

The Curtain-Williams Automobile Co., of Columbus, Ohio, has purchased two lots on Parsons avenue, opposite its present garage. It is proposed to build on the plot a larger station in the spring.

F. K. Mears, of Philadelphia, Penn., has been granted a permit for the erection of a one story garage, 55 by 256 feet, to cost $5,000. It will be located at 220-222 South Fortieth street, that city.

The Great Western Cycle and Auto Co., Minneapolis, Minn., is building a three story gray brick garage on Sixth street, between First and Second avenues, South, to cost $20,000. It will have a frontage of 50 feet and depth of 150 feet.

Prince Wells, of Louisville, Ky., is having plans drawn for the erection of a garage on the Ralph property on Fourth avenue, which has just been acquired at a purchase price of $15,000. The garage will be three stories high and will cost approximately $35,000.

The T. C. Whitcomb Automobile Co., of Cleveland, Ohio, has increased its capital to $10,000. They will rebuild their garage and go more extensively into the agency field for 1906. They have adopted the Rambler as their leader for next year, and will probably add one or two other well known cars to their line.

Although their present garage was built only a short time ago, F. E. Lockwood & Co., the Norwalk (Conn.) dealers, have found it inadequate to meet their growing needs, and, accordingly, will build an addition to the north side of their Water street establishment. To make this possible a plot of ground with forty feet frontage has been purchased.

The Week's Incorporations.

New York City, N. Y.—The Newcomb Motor Co., under New York laws, with $400,000 capital. Corporators—W. A. Newman, J. A. Mooney and T. H. Ferry.

Nichols, Ct.—The Nichols Auto Transit Co., under Connecticut laws, with $5,000 capital. Corporators—Erwin S. Fairchild, Nathan B. Curtis, Edward Nothnagle and Augustus Murr.

New York City, N. Y.—Long-Turney Mfg. Co., under New York laws, with $50,000 capital; to make motors, engines, etc. Corporators—W. L. Kingsley, T. H. Stryker and G. W. Turney.

New York City, N. Y.—Stoddard-Dayton Agency of New York, under New York laws, with $15,000 capital; to deal in automobiles. Corporators—C. H. Hill, C. E. Zimmerman and James McIlvrid.

Hartford, Conn.—Miner Garage Co., under Connecticut laws, with $10,000 capital; to deal in, store and rent automobiles. Corporators—Edward Y. Judd, Samuel A. Miner and Arthur L. Shipman.

New York City, N. Y.—The Mercedes Import Co., under New York laws, with $100,000 capital; to manufacture and deal in automobiles. Corporators—E. C. DeWitt, M. Wineburgh and Arthur Braun.

Sprague Making Large Additions.

The Sprague Umbrella Co., of Norwalk, Ohio, is adding several new buildings to its extensive plant, which, when finished, will make it the largest canopy and top factory in this country.

The growth of the company's automobile trade requires increased space and facilities, and Colonel Sprague states that he is anticipating the additional demands and buildings accordingly.

The new additions are being constructed in the most substantial manner. Some years ago this plant was wrecked by a tornado, was rebuilt, and then wiped out by fire. But the new parts now being erected can be affected, the Colonel says, by nothing except an earthquake.

LEAVITT SHUTS UP SHOP

Has a Fire and then Pressure of His Victims Causes Him to "Retire"

So far as active participation in business is concerned the Leavitt Motor Car Exchange of perfumed reputation is no more. One after another its victims turned upon it, until taking to the woods must have appeared far preferable to facing a dozen or more irate victims, each bent on having his pound of flesh—at least that it what has happened, and there are a number of individuals who would be glad to pay for information of the whereabouts of Leavitt.

Despite the fact that he was out under $10,000 bail in a civil arrest case, instituted by Gerald Gerome, and has anywhere from six to a dozen actions of one kind or another pending against him, Leavitt continued to do business until Charles Steuerwald, who hails from across the border in Jersey, got after him. Mr. Steuerwald had a Pope-Toledo touring car of last year's model which he was anxious to dispose of, and Leavitt made him such an alluring offer—$2,400—that he was induced to take a thirty-day note for it—the usual procedure. When the note became due and remained unpaid an action was brought, and, although Leavitt's attorney filed an answer to the complaint, no order was obtained from the court for permission to sue, this being necessary, as the defendant was a corporation, and judgment was taken by default. In the mean time the car was sold to T. B. Ackerson, a real estate broker, and Leavitt decamped, a fire a few weeks previous having conveniently occurred in his office and damaged nothing but his books and records.

The Leavitt Motor Car Exchange thus still remains a legal entity upon the books of the State which gave it being as a corporation "to deal in, buy, sell and repair motor cars for profit," but it is doubtful if any more tangible trace of it will henceforth be found elsewhere.

In consequence the many who have paid their good money in one form or another, whether for cars that they could not use to Leavitt, or to their lawyers for prosecuting him, will be equally well off—they will have the experience, but little else.

So far as Mr. Steuerwald is concerned, he has a worthless judgment for $2,434 and some cents, representing the amount of the note and costs, and another man has his car.

Among other expedients, that of calling a meeting of the creditors with a view to putting the concern in bankruptcy was tried, but as the available assets were insufficient to pay the referee it was abandoned.

Fischer Sale Attacked in Court.

Argument was heard before United States District Court Judge Cross, sitting in Newark, N. J., on Wednesday, on the return of rule to show cause why the sale by J. W. Bellis, of Hoboken, receiver for the Fischer Motor Vehicle Co., of the assets of that company at private sale for $8,000, made pursuant to an order of the court, should not be set aside. The order to sell was secured by Otto Horwitz, of New York, a creditor of the insolvent company. The receiver was appointed July 29, and the sale was made September 18. The receiver insisted that the sale was advantageous to the company, and should be allowed to stand, and that it should be confirmed without delay. Mr. Horwitz opposed the sale on the ground that the price was inadequate. Attorney General Robert McCarter, E. Q. Keasbey and James F. Minturn, the latter of Jersey City, representing the greater part of the creditors, insisted that the sale should be confirmed.

Sues Kitto for a Loan.

A civil action which has been brought against William H. Kitto, president of the Simplicities Auto Co., of Middletown, Conn., has interfered with the purpose to wind up the affairs of the concern. The Warwick Cycle and Automobile Company, of Springfield, has brought proceedings against Kitto to recover $1,000 loaned to him, and the Simplicities Company, which Kitto claims is indebted to him, has been garnisheed for the amount. As a result of these proceedings the special meeting of the stockholders which was called to act on a vote of the directors to wind up the concern has been postponed.

Kruger Organizes in Milwaukee.

The Kruger Mfg. Co., of Milwaukee, Wis., has been organized with a paid up capital stock of $15,000. A four-story building will be erected near the foot of Biddle street, in which, it is said, the new company will build automobiles and conduct a general garage business. The officers are: President, Julius Roehr; vice-president, John McCoy; secretary, Ross McCoy, and treasurer, Henry Kruger.

Declares Insurance Rates Off.

Advices from Boston state that the New England Insurance Exchange has declared off all rates on automobiles, permitting each company to change what it pleases. Hitherto the rate was 3 per cent, and the marine companies were enabled to corral the business by getting under that figure.

Worcester Garage in Trouble.

John A. Dean, the Worcester, Mass., garage man, has filed an involuntary petition in bankruptcy. His debts amount to $3,850.28, of which $400 is secured. There are about one hundred unsecured creditors. Dean's assets amount to $287.

Bates to Lease Lansing.

According to advices from Madison, Wis., the Bates Automobile Co., of Lansing, Mich., purposes moving from the Michigan city to Madison. A deal for the large building formerly used by the Schredder Mfg. Co. has practically been closed.

LICENSED MAKERS' BUSY SESSION

Nothing Made Public but Chance Remarks Indicate Some Important Happ nings.

From the attitude of those who attended the meetings of the Association of Licensed Automobile Manufacturers in New York on Tuesday and Wednesday of this week, it was made plain that matters of unusual moment had been considered.

It was admitted that the drawing for space in the Madison Square Garden Show had occurred, and that every one is not only satisfied but immensely pleased with the arrangements that have been made. Practically all the exhibitors will have to do will be to deliver their cars at the door of the building. From a chance remark, it is known also that heaven, or, at any rate, a broad expanse of delicately painted blue sky, will cover the exhibits. The sky, with its twinkling stars, will completely hide the roof of the big garden.

Aside from admitting the allotment of spaces, none of the licensees would talk of what occurred at the meeting. Indeed, it was plainly stated that "nothing for publication will be given out." Remarks let fall, however, indicate that prices and discounts were the subjects of discussion, and that the engineers, or mechanical branch, presented a report of some sort, Henry Souther and one or two other engineers being in actual attendance.

There is good reason for stating, also, that the A. L. A. M. and the tire manufacturers have come to an agreement respecting tire weights and sizes for next year.

"Well, the tire matter has been settled," one of those present at the meeting was heard to remark, in a tone of undisguised elation.

"Yes, I know it," responded the party addressed. "The settlement will save me $11 on every one."

Will Make Radiators in Rome.

Papers were taken out last week for the incorporation of the Long-Turney Mfg. Co., of Rome, N. Y., with a capital stock of $50,000, all of which, it is stated, has been paid in. The company, which is an offshoot of the Long Mfg. Co., of Chicago, will manufacture automobile radiators, spiral tubing and other metal specialties, spiral tubing and the three story brick building in Rome, just vacated by the Utica Industrial Co. Dr. W. L. Kingsley, who will be president of the new company; Thomas H. Stryker, G. W. Turney and J. S. Hasleton, of Rome, and J. B. Long, of Chicago, are named as incorporators.

Unwin Out of the Harrolds.

Harry Unwin, manager of the Harrolds Motor Car Co., the Pierce agents in New York, has resigned his office and severed all connection with the company, of which he was the organizer.

The Constructive Principle of Fisk Tires Involves

A Technique So Simple in Manipulation and So Positively Accident-Proof

that it should readily appeal to any discriminating purchaser.

Beads of a wedge shape are applied to a flat rim and held by rings which are rolled on an angle corresponding to that of the bead, so that when drawn down by clamping bolts, the bead acts as an inside cone wedge, with the result that the tire is firmly held to the rim, without air pressure or circumferential contraction.

A Tire so Locked to the Rim Incorporates a "Life Preserving Principle" and Reduces Tire Maintainance to an Economic Basis.

HERE'S ANOTHER HOT ONE

from a Western Dealer who, for obvious reasons, wishes his name withheld.

CADILLAC AUTOMOBILE CO.,
Detroit, Mich.

Gentlemen:--

We have noted with interest your fable on "Tale of Twisted Prices" in the current issue of Motor Age. We were in a position to see the point without the use of a microscope. In fact, we got stung a little ourselves; but that was a trivial matter in our estimation as compared with the effect on some of our good customers. Now, we do not feel that it will be a good thing for us to walk up to the stinger again, and we are seriously considering the advisability of making some other line our leader for 1906, and the particular object we have in writing this letter is to inquire whether you would, under any circumstances, consider a proposition to cut out a certain amount of territory now handled out of ------ and ------ and make a direct contract at this place.

The above dealer is a good one and has sold a large number of cars, has taken good care of his trade, maintained the prices which the maker had fixed for him, but, with what result? Can any honest dealer square himself with his trade when placed in a like position? We doubt it. Cadillac dealers can face everyone of the 3,700 owners of 1905 single cylinder Cadillacs and honestly say:—"The Cadillac prices were right at the beginning, they are right now and will be next year."

The Tinkering with the American Team.

Whether or not the Vanderbilt Cup Commission reverses itself—of which there appears to be small likelihood—one thing is beyond the shadow of doubt—the elimination race enhanced the reputation of the American stock car in no small measure.

For that reason, it was worth all it cost, and more. It is the stock car in which the man in the street is interested when it comes to making a purchase. Though the pill administered to the Haynes and Royal entrants may appear a bitter one, it is not as bitter as it seems.

There is glory enough for all, and their shares of it are too great and too brilliant to be lessened or dimmed by anything that may have been done or that may be done.

Not to credit the members of the Cup Commission with honorable and patriotic motives is churlish and despicable to a degree. They are serving the cause unselfishly, and have naught to gain. Their situation was not an enviable one. It is plain to see that they thought not of men nor of machines, but of the glory of all America. But their rejection of the Thomas car is the one weak point in their armor. It is an action which not even their friends can successfully defend. But their own statements leave them bereft of sound argument. The Thomas car is a special racer, designed and built for the event. It is the product of a known and established manufacturer. It performed well. Its mishap was a trivial one.

If, as appears to be the case, horsepower was the deciding element in the judgment of the commission, then the Thomas is equal with the car that finished first. Save for its rated horsepower, the Christie car had not and has not a solitary attribute that entitled it to superior favor. Practically everything about it is an unknown and untried quantity. It is not the product of an established automobile manufacturer. It has shown no speed save for short distances on marblelike beaches. Its time for one good circuit of the Long Island course is not comparable with the speed attained by the Thomas. It is the testimony of all whose business it was to observe the action of the cars, that the Christie acted like a rubber ball—that its forward half is not on the road more than half the time.

There is not a single redeeming thing that can be said in defence of the Commission's action in this regard, and it deserves the condemnation it has received, separate and apart from the other cars concerned. If the Commission has the courage that inspired its initial action, it should explain its action or manfully admit that it erred on one point at least, and, having erred, correct it.

Foreshadows of the New Models.

Now that the 1906 models are being announced in rapid succession, their specifications are such as utterly to refute the prophecies of those ill informed alarmists who have been predicting radical changes for next year's cars of a nature that would cause those turned out in 1905 to appear antiquated.

Take any of the new cars of which next year's features have already been made public, and, without exception, they will be found to differ so slightly that to the ordinary observer it will be difficult to distinguish the 1906 car from its successor of the same make when on the road. Perhaps the chief characteristic noticeable, particularly in the case of those makers who have hitherto confined their efforts to touring cars of not greater than 24 to 30 horsepower, is an increase in size and power. Corresponding increases in the size and capacities of the other essentials have naturally been necessary to conform to the larger motors, and it is in this respect mainly that most of the changes, where there are any, will be found.

Larger carburetters, pumps and transmissions, heavier gears for the change speed gear box, these with whatever other refinements that may have suggested themselves to the maker, constitute the points in which probably the great majority of the 1906 cars will differ from their predecessors of the present year, which in many cases have been their prototypes.

Despite all that was said at the opening of the present year regarding the danger limit having been reached and in some cases exceeded where the length of the wheel base was concerned, the new comers in many instances will show still further increases, although these, in the main, will be small; nothing like the jump from the short, dumpy car to the long, low and easy running machine that has been the rule rather than the exception since the shortcomings of the former were recognized.

As already pointed out in these columns, there will be more or less change where the ignition is concerned, but it will be a shifting process more than anything else. From accumulators to magneto, and vice versa, will be one of its characteristics, though in the case of the more expensive cars the equipment will include both these forms. The light car will remain loyal to the dry cell, and, on the whole, little or nothing new is looked for in this department.

The car with 30 to 50 horsepower will, doubtless, become the accepted standard for touring purposes, and anything between that and the runabout will be generally classed as a "light touring" car, a classification that will, in consequence, include close to 70 per cent of all the cars turned out for next season's selling.

The time to look for radical changes that will shelve each year's car upon the appearance of its successor passed with the adoption of the present type.

There always will be those who question the influence of sport on trade, and particularly such sport as automobile road racing. But its good influence was never made so plain as by our Paris letter, published in another column. How it practically established the industry in Italy and made that country world famed in a mechanical art is set out so clearly that none can misunderstand.

THE REAL ELIMINATING TRIAL

Arranged in Advance and Consummated in a Clubroom—Three Cars Loses Places on American Team and a Fury Ensues.

Without warning, or with small warning, the Vanderbilt Cup Commission hurled a thunderbolt late Monday afternoon last. These members had foregathered at the rooms of the Automobile Club of America: Robert Lee Morrell, W. K. Vanderbilt, Jr., E. R. Thomas, T. H. Hilliard, E. T. Birdsall and S. M. Butler, of New York; E. H. R. Green, of Dallas, Tex.; George L. Weiss, of Cleveland; F. C. Donald, of Chicago; A. L. Riker, of Bridgeport, Conn., and J. L. Breese and Secretary Batchelder of the A. A. A. Before the bolt was hurled in formal shape Messrs. Breese and Riker retired, the former because of being the nominator of the Christie car, and the latter because he was interested in the Locomobile racer.

Some three weeks ago Chairman Morrell had caused it to be known that the committee reserved the right to select the five cars which in its judgment were deemed most capable of capturing the cup. The announcement caused some mild comment at the moment; but its full significance was not fully grasped.

That some inkling had escaped that the commission purposed bringing the ruling to bear at the meeting on Monday was evident. Newspapermen and either the competitors themselves or representatives of nearly all of the cars that had competed were on hand. They all knew what was to be done—that for the Royal, Haynes and Thomas cars that had qualified in the race on Saturday were to be substituted the White, the Lytle Pope-Toledo and the Christie, each of which had met with accident and failed to finish the contest. It was discussed freely, and when James L. Breese, who was supposed to have retired from the conference before action was taken, appeared in the ante-room, he was promptly approached by the reporters.

"What reason will the committee give for its action?" he was asked.

"Reason?" he jerked out grandiloquently through his prominent lips which a beard fails to hide. "We give no reason; we just did it."

The representatives of the Thomas, Haynes and Royal entries sent in their cards and asked for a hearing, but none was granted.

No really formal announcement of the decision was made. As has been made evident, none was necessary. When Secretary Batchelder came out of the room he was promptly surrounded. Every one was seeking reasons. Batchelder was diplomatic. He did not say a great deal. The two bits of news brought out were that the Christie car had been accepted conditional on its being driven by Mr. Christie himself, and that the reason no hearing was accorded when it was asked for was because the vote already had been taken. It was left for Chairman Morrell to give the explanation. It was short and to the point.

"The fact of it is we were up against a hard proposition. The committee felt it represented the American people in an endeavor to keep the Vanderbilt Cup in this country, and we picked the cars we believed to be the fastest to meet the powerful foreign machines," was all he said.

"It must be remembered that the manufacturers of the Pope-Toledo, White and Christie machines have gone to great expense in developing high speed cars, and therefore deserved consideration," was the suggestion of a member of the cup commission that seemed to throw some light on the decision.

Then the storm burst. Words—that is, printed words—are not equal to the task of expressing the indignation and denunciation "Robbers!" was the mildest of the terms applied to the cup commissioners.

"Use the very strongest language the law will permit you to print, and put it in our mouths. Nothing you or any one else can say will express our feelings too strongly or too bitterly. The whole thing is a most damnable outrage." This was what one of those affected by the decision had to say when approached by a Motor World man.

"If we were to be robbed of the fruits of our victory," said V. E. Minich, of the Haynes Automobile Co., who voiced the sentiments of the others, "why was our money taken? If the team was to be selected regardless of results, why was an eliminating race held? Was this done simply to make us feel we had obtained value received? We entered this contest in good faith. We paid an entry fee of $500, and we directed the best efforts of the factory to the construction of one of our 1906 stock cars at a time when we were busily engaged in completing our 1905 output.

"It cost, in addition, several thousand dollars to send the car and a force of men to Long Island to prepare for the race. In return for this, after fairly winning a place in the team, we are told by the commission that they have thrown out our car and two other cars that finished the trial race so that their places may be taken by machines that were disabled in that race. What kind of a deal is that?"

Twenty-four hours had the effect of slightly lessening the bitterness of the situation. There was talk of applying for an injunction restraining the cup commission from altering the result of the race, and later of suing for the return of the entry fees, but as yet nothing of the sort has been done.

"The brutality of the whole affair is what makes it hurt so much. It was bad enough to have the verdict prearranged and so generally known that it was discussed even before it was rendered, but to be denied a hearing is to be denied the common courtesy that is accorded to everything short of a dog," is the way one interested but impartial man viewed the situation. "How such a lot of men as compose the commission could be so lacking in tact and diplomacy in handling such a delicate matter is beyond my understanding. Their treatment was positively brutal. The men they had to deal with are not fools. I honestly believe if they had been approached in the proper spirit that they would have met the committee half way, and what has been made a nasty mess would have ended in a love feast."

Accepting as final the re-elimination by the cup commission of the team to represent America in the Vanderbilt Cup race on Long Island on Saturday, October 14, the teams will be constituted as follows:

American Team.

Bert Dingley	60	Pope-Toledo
Joseph Tracy	90	Locomobile
Herbert H. Lytle	70	Pope-Toledo
Walter White	40	White
Walter Christie	90	Christie

French Team.

Duray	120	De Dietrich
Sisz	100	Renault
Wagner	80	Darracq
George Heath	120	Panhard
Hemery	80	Darracq

German Team.

Baron de Caters	120	Mercedes
John B. Werden	120	Mercedes
Foxhall Keene	120	Mercedes
Camille Jenatzy	120	Mercedes
Werner	120	Mercedes

Italian Team.

Vincenzo Lancia	110	F. I. A. T.
Felice Nazzaro	110	F. I. A. T.
Emmanuel Cedrino	110	F. I. A. T.
Louis Chevrolet	110	F. I. A. T.
Paul Sartori	90	F. I. A. T.

Vincenzo Lancia and Felice Nazzarro, of the Italian team, arrived in New York this week, and the other three F. I. A. T. drivers—Chevrolet, Cedrino and Sartori—are residing here. Camille Jenatzy, one of the Mercedes drivers of the German team, also set foot on American soil this week, and the remaining Germans and Frenchmen are daily expected.

Dayton Club to Disband.

Dayton, Ohio, will soon be minus an automobile club. At the September meeting of the Dayton Automobile Club, because of the laxity of interest and non-support by the members of the club, and because expenses exceed the revenues, it was resolved to close the clubrooms at Nos. 14 and 16 South Jefferson street and eliminate expenses. It was further resolved to sell the property at public auction on the second Friday in October and to disband the club not later than November 1.

Bennett Cup to Go to Italy.

It is reported that the future of the Bennett Cup is at last about to be definitely settled. The donor himself is said to have signified his intention of devoting the trophy to a contest for touring cars, and it is thought to be probable that the custody of the cup will be entrusted to the Automobile Club of Milan, Italy. The latter country will, in consequence, be the scene of the first contest.

Quite unexpectedly, two trials were necessary to decide the make-up of the team that shall represent America in the race for the Vanderbilt Cup on October 14.

As per programme, the first trial occurred on the Long Island course on Saturday morning last, 23d inst. The second trial took place on Monday night, 25th inst., in the rooms of the Automobile Club of America, in New York City. W. K. Vanderbilt, Jr., the donor of the cup, was referee of the road trial. He also was present at the meeting of the Vanderbilt Cup commission, which sat in judgment and rendered the verdict in the second trial—a verdict that unloosed a hell of contention and denunciation.

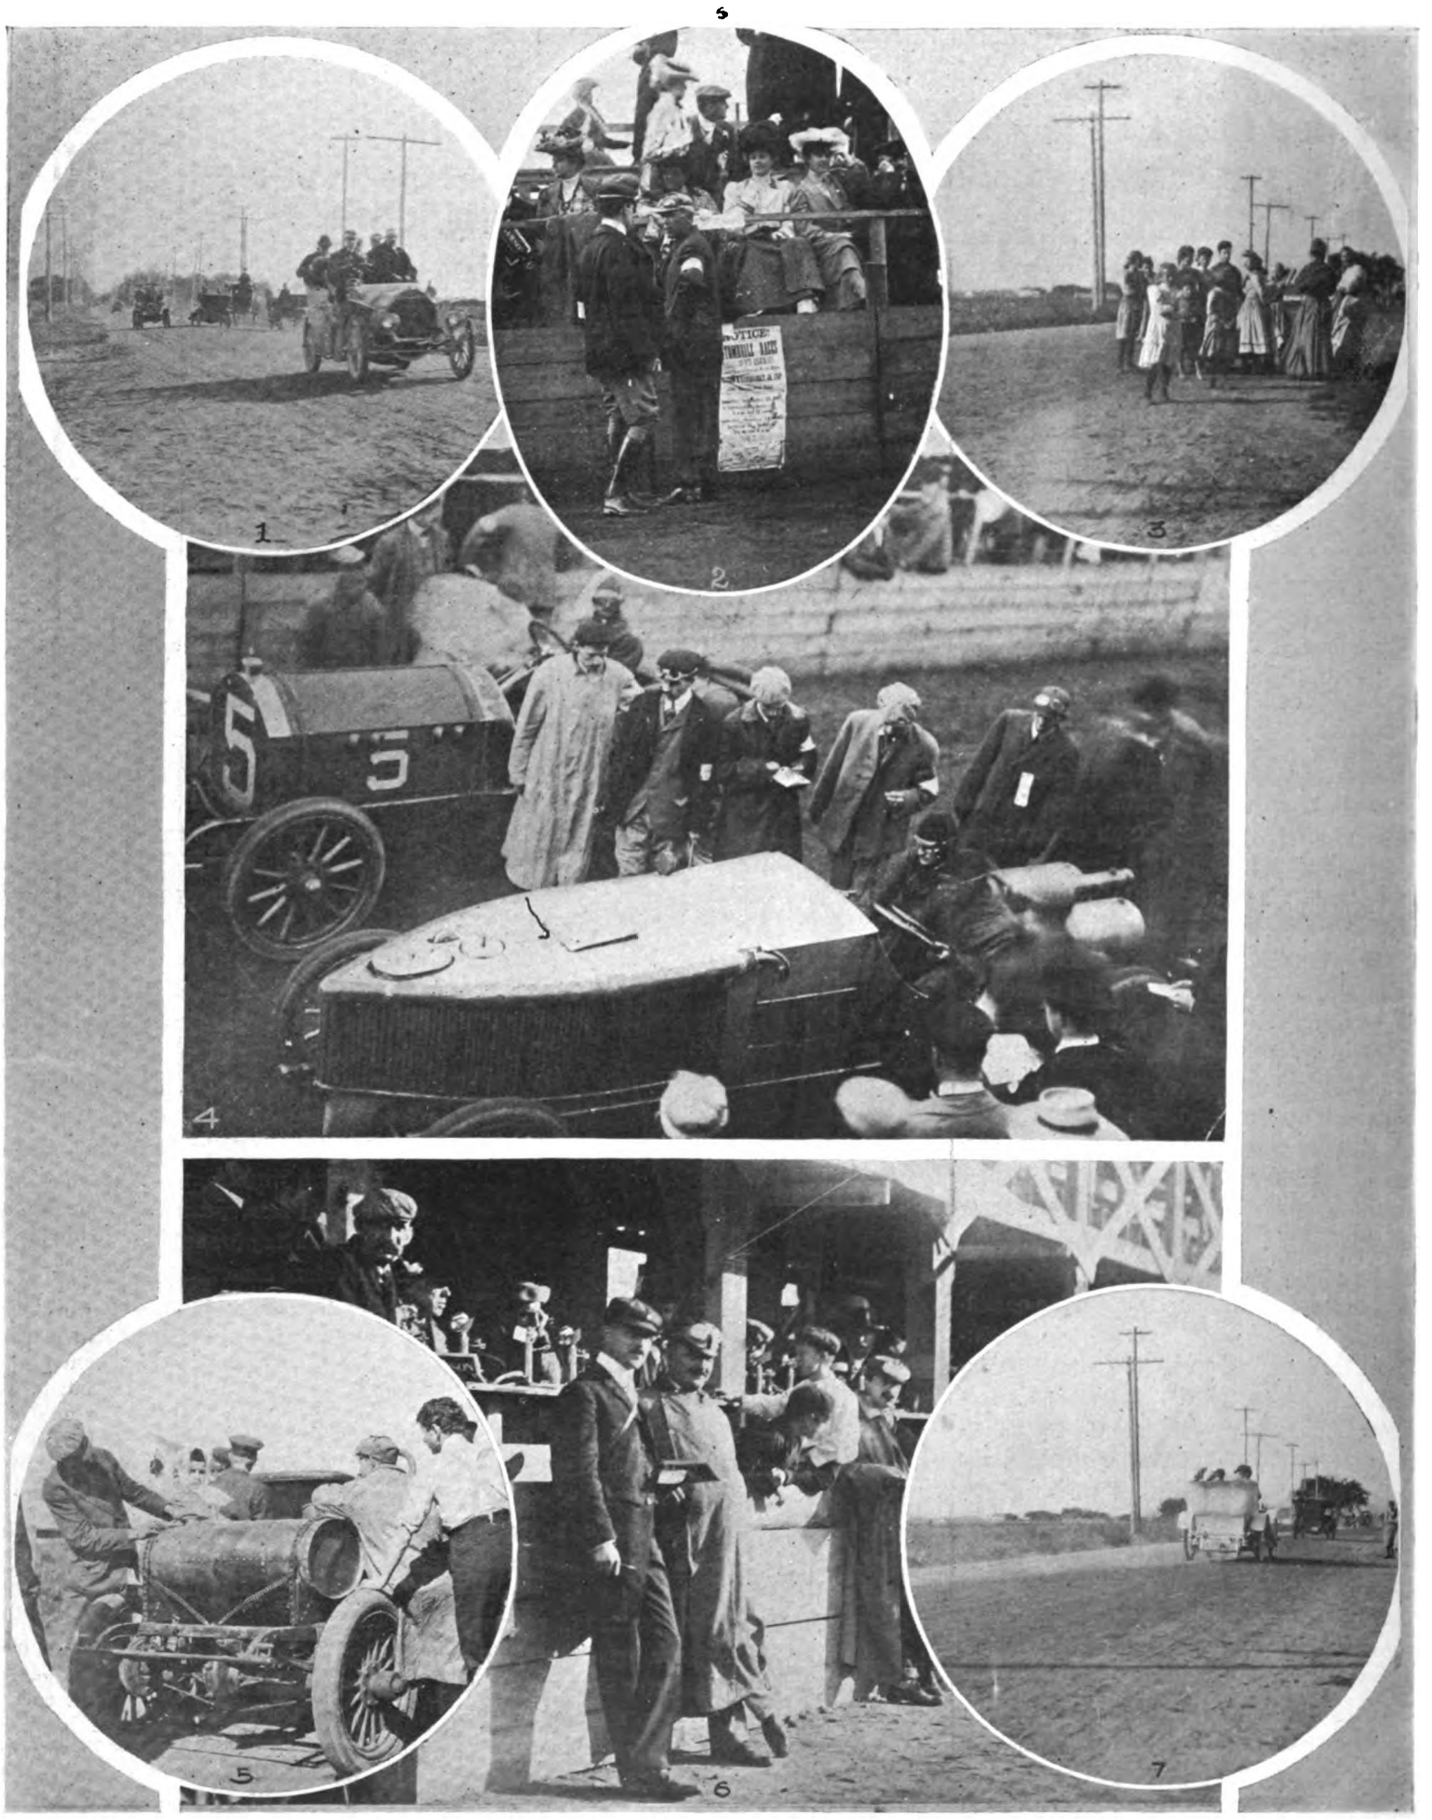
In Monday's trial on the road these men and these cars qualified: 1, Bert F. Dingley, 60 horsepower Pope-Toledo; 2, Joseph Tracy, 90 horsepower Locomobile; 3, Robert Jardine, 40 horsepower Royal; 4, Frank Nutt, 50 horsepower Haynes; 5, Mortimer Roberts, 60 horsepower Thomas.

In the clubroom trial on Monday the qualification of Dingley and Tracy passed unchallenged, but for Jardine, Nutt and Roberts there were substituted H. H. Lytle, 75 horsepower Pope-Toledo; Walter C. White, 40 horsepower White, and Walter Christie, 120 horsepower Christie, each of whom in the road trial suffered an accident that prevented him from completing the full distance of 113.2 miles, made up of four circuits of 28.3 miles. Despite the storm that is blowing there is small reason to believe that the result of the second trial will be altered.

This story has to do only with the first trial—the race over the pipe shaped course laid out in the most picturesque, rolling portion of Nassau County, N. Y., a portion in which

DINGLEY.

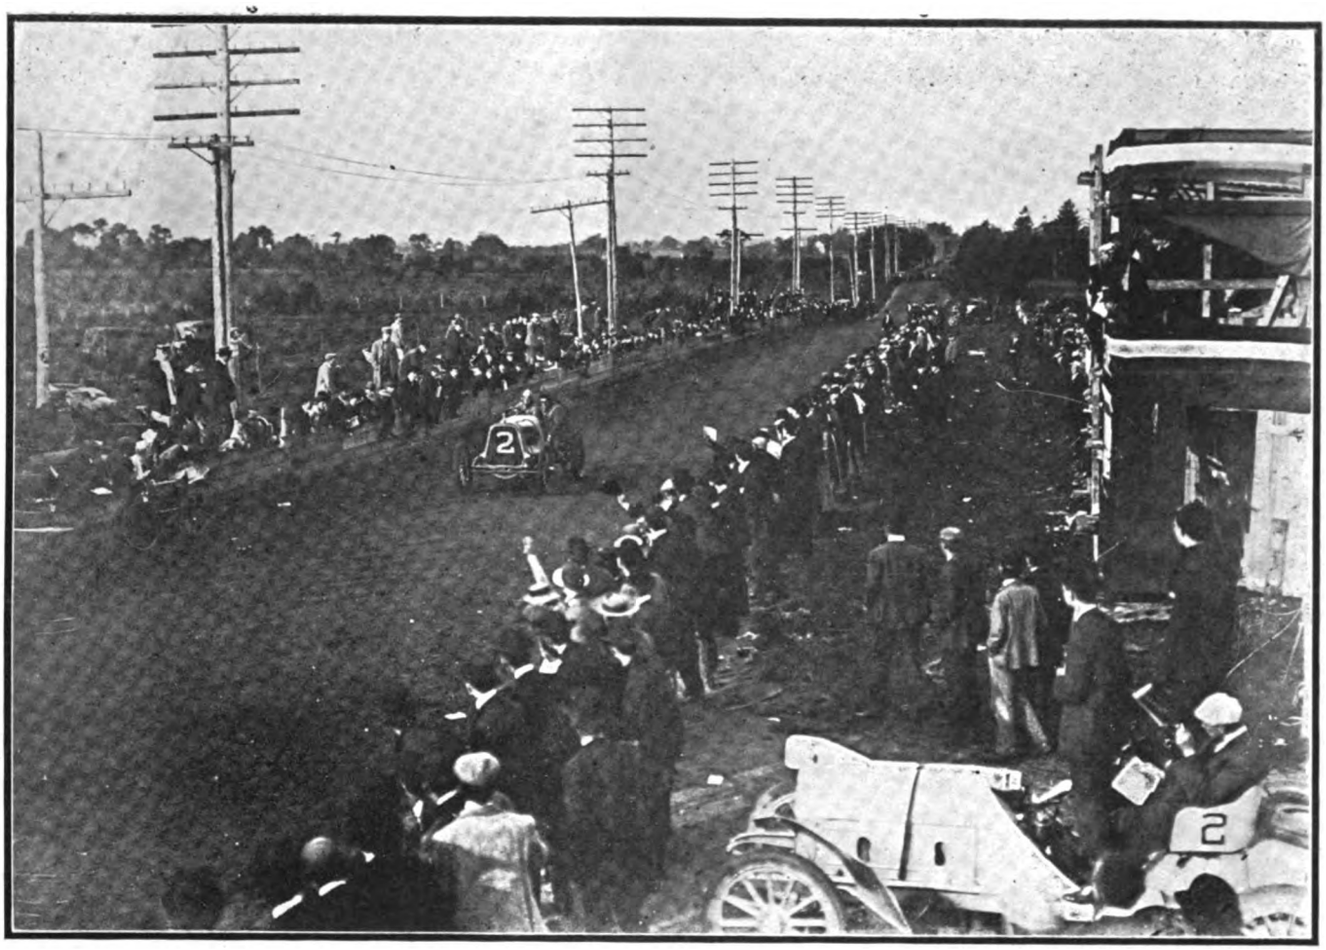
houses are few and far between, and in which for the amount of travel to which they are subjected, much of the road is ununderstandably good. Perhaps it is due to the fact that Wealth has not a few estates in the vicinity.



His victory has been heralded in so many places in such big, black type that he's a queer sort of individual who does not know that very, very early in the morning of September 23 Bert Dingley, driving A. L. Pope's 60 horsepower Pope-Toledo, "skiddooed" over that 113.2 miles of Nassau County highway at a clinking pace—2 hours and 50 seconds, equal to 56¼ miles an hour, beating the second man, Joseph Tracy, in Dr. H. E. Thomas's 90 horsepower Locomobile, by a scant 59 seconds.

In their settings these big road races differ little one from the other. The men, the cars, the incidents, the sidelights only—or chiefly—are different. The night before men in motor cars and men not in motor cars gather in large numbers at the hostelries near to the starting point. Some of the men sleep; some drink themselves to sleep; some sleep not at all. All these races start at about the time the hens are leaving their roosts, and long before the first cock has crowed or the sun has lifted the mantle of night all men, bright eyed and heavy eyed, native and visitor, are astir. Motor cars, their big, bright orbs piercing the gloom, fill the roads, and there are horse drawn wagons and bicycles and motor bicycles and men, women and children afoot—all, all trending toward that long, unpainted pine structure denominated a grandstand.

There they stop; there they scatter—cars are parked, many men and a few women seat themselves in the stand; more of them range themselves on either side of the road. Men with broad ribbons on their left arms dart hither and thither or loll in waiting idleness. They are the officials. Native yokels with a fluttering ribbon pinned on their coats stride up and down. They are the special constables, full of their brief authority. There are other natives—they bear a red or a yellow flag, or both. They are the signalmen—the men who give the signs of safety or of danger, to which few give heed. Like the constables, the race is placing an honest dollar in their pockets that otherwise would not be there.



The first faint streaks of dawn find eight

DINGLEY, VICTORIOUS, DASHING DOWN THE HOMESTRETCH.

or ten or a dozen big belching motor cars containing each two men in more or less fantastic dress, near or nearing the grandstand—the starting point. They are the contenders—the centres of interest. Gaping crowds stare at them or gather round. Most of the men are white faced—their skins are suggestive of paste. Obviously they are nervous and are seeking not to show it.

Carry this picture in your mind's eye and you have a picture of the setting of all these great races—a picture of the setting of the race of Saturday last. In small wise does this setting differ here or abroad. The strengthening day may disclose a background of hill or plain that is unlike, but all else—nearly all else—is the same. The day discloses that group of throbbing giants, compactly welded of steel and iron, awaiting the time and word that will cause them to bound forward on the long, black ribbon—the stretch of oiled road that narrows to nothingness in the far distance.

There were ten of them gathered there at Mineola at dawn on Saturday last. There should have been twelve. Carl Fisher, with his big Premier—No. 11—and Tom Cooper, with his well tuned Matheson—No. 10—were the absent ones. The Premier could not "make the weight"—2,204 pounds—and to make it the Cooper car had been fitted with a lightened lubricating system; it failed to serve; the engine overheated and "seized" the day before, and damage enough was done to keep it out of the fray.

The ten that lined up for the honor of entering the race of October 14 and seeking to wrest from France the massive silver trophy carried from these shores a year ago were:

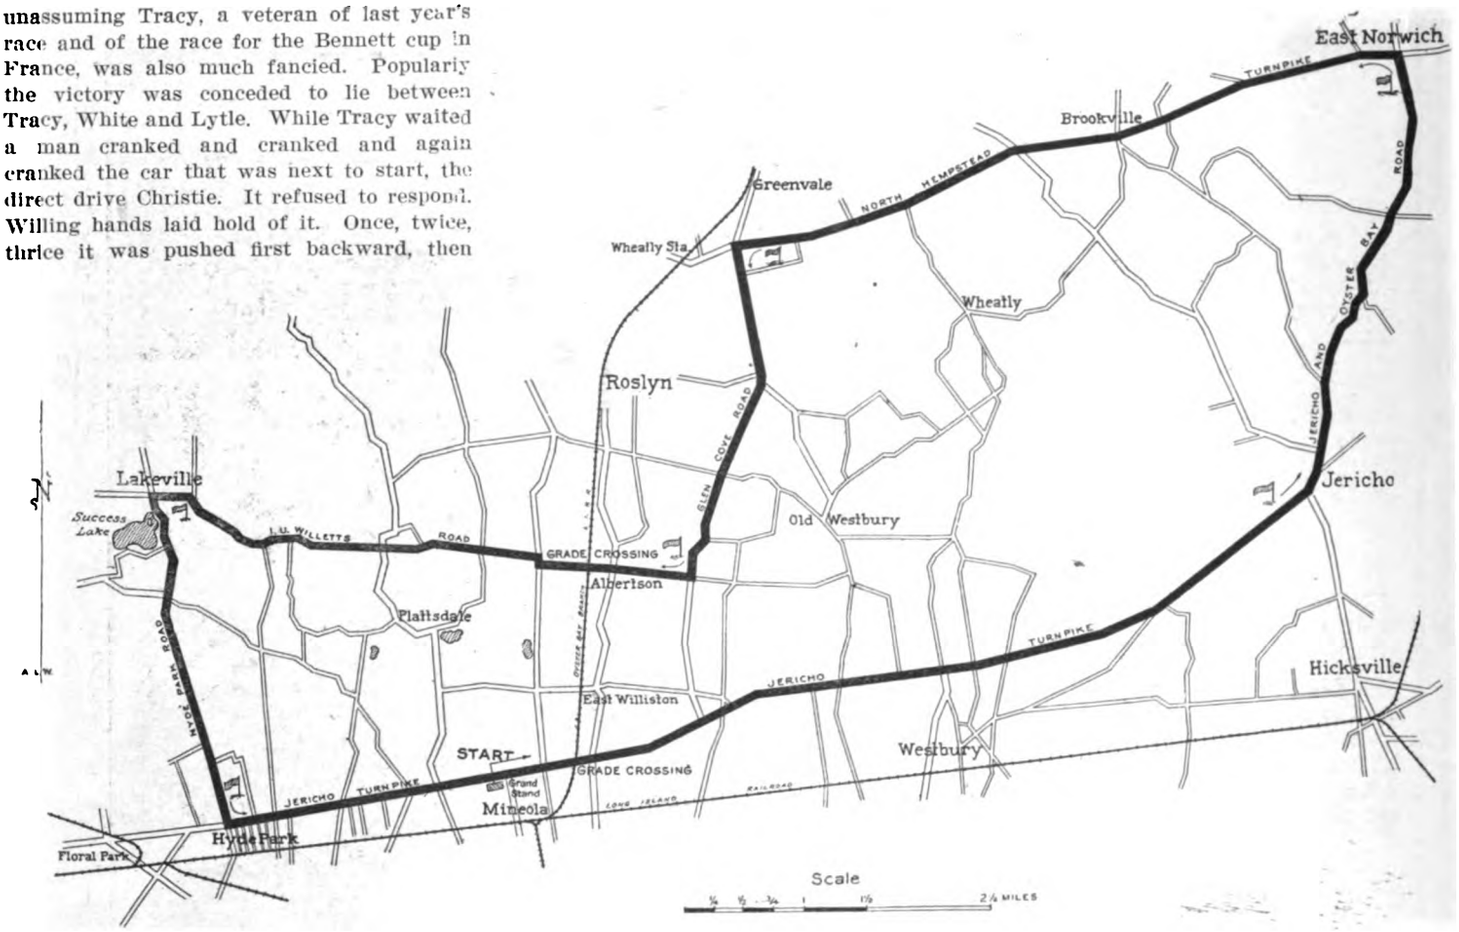
No.	Car.	Driver.
1.	50 h. p. Haynes	Frank Nutt
2.	60 h. p. Pope-Toledo	Bert Dingley
3.	40 h. p. Matheson	Ralph Mongini
4.	40 h. p. White	Walter White
5.	90 h. p. Locomobile	Joseph Tracy
6.	60 h. p. Christie	Geo. Robertson
7.	40 h. p. Royal Tourist	Robt. Jardine
8.	60 h. p. Thomas	M. Roberts
9.	60 h. p. Franklin	W. F. Winchester
12.	75 h. p. Pope-Toledo	H. H. Lytle

WATCH TICKS AND TENSION.

They started in this order at two minute intervals. Each car bore on its front and on its sides the number that accorded with the order of its starting. Each was in readiness.

Daylight—soft daylight—flooded the country. It was nearing 5:32 o'clock.

"Get ready, Nutt. You've got exactly five minutes," remarked Starter Wagner, watch in hand.



The influence of the remark swept the crowd. It buzzed with quickened interest, then quieted, while necks were craned and constables "got busy."

"Four minutes!" came from the starter; then "Three minutes!" "Two minutes!" "One minute!" Then the seconds were counted in tens to ten seconds. "Five, four, three, two one!" Then "Go!" was fairly shrieked into Nutt's ear. He went with a roar of explosive energy and a great puff of smoke from his heaven pointed exhaust.

Ten times did the starter repeat these words. Dingley, looking like a night gowned monk, was the next to hear them; then were they tolled off to Mongini, the one foreign driver in the race. Walter White, soft skinned and never more truly named, in his low shoe shaped craft of white went next—or perhaps "went" is not the best word. The day before he and his car had had a nasty spill in trying the course. Some damage had been done, but it had been repaired; it was not an auspicious prelude for the man and the car on which high hopes had been set. White heard the "Go!" An instant before a Motor World man had glanced at his steam dial; the hand was dancing at the extreme pressure, 1,200 pounds. When at the word this tremendous force was applied something went. It was not the car. There came a plume of white smoke, a dull thud, and the great white shoe simply coasted away from the line. It stopped a hundred yards beyond and was instantly surrounded by a curious crowd. The toggle joint of the universal shaft had broken. It was a bitter portion. But the crowd had no eyes for the unfortunate. Tracy, with his thundering Locomobile, was on the line belching blue fire. The

Digitized by Google

unassuming Tracy, a veteran of last year's race and of the race for the Bennett cup in France, was also much fancied. Popularity the victory was conceded to lie between Tracy, White and Lytle. While Tracy waited a man cranked and cranked and again cranked the car that was next to start, the direct drive Christie. It refused to respond. Willing hands laid hold of it. Once, twice, thrice it was pushed first backward, then

OFFICIAL MAP OF THE COURSE.

forward, while Driver Robertson performed some deft manipulations. Then of a sudden it volleyed like a battery of great guns, the roar mingling with that of the swiftly departing Locomobile, the white handkerchief that plumelike floated from the driver's skull cap discernable through the smoke. The Royal, the elongated Thomas, the high built, buckboardish Franklin (each in order) got off without incident. Only Lytle, another veteran and another prime favorite, remained. What were his thoughts? The question was quickly answered.

LYTLE GETS HIS GUM.

"Gum? Gum? Who has any gum?"

It was the alert Pardington, assistant referee by title, almost referee in fact, who spoke. There was no response.

"Gum? Gum? Mr. Lytle wants gum," he repeated through the short megaphone he carried and directing it in several directions.

Several hands dived in several pockets. One of them fished out a packet of the chewing material, and Lytle was made happy. A moment later the little man in the big car heard "Go!" yelled into his ear. For a brief moment his car refused to budge. He had not released the brake. Another moment and he was off. The struggle was fairly on.

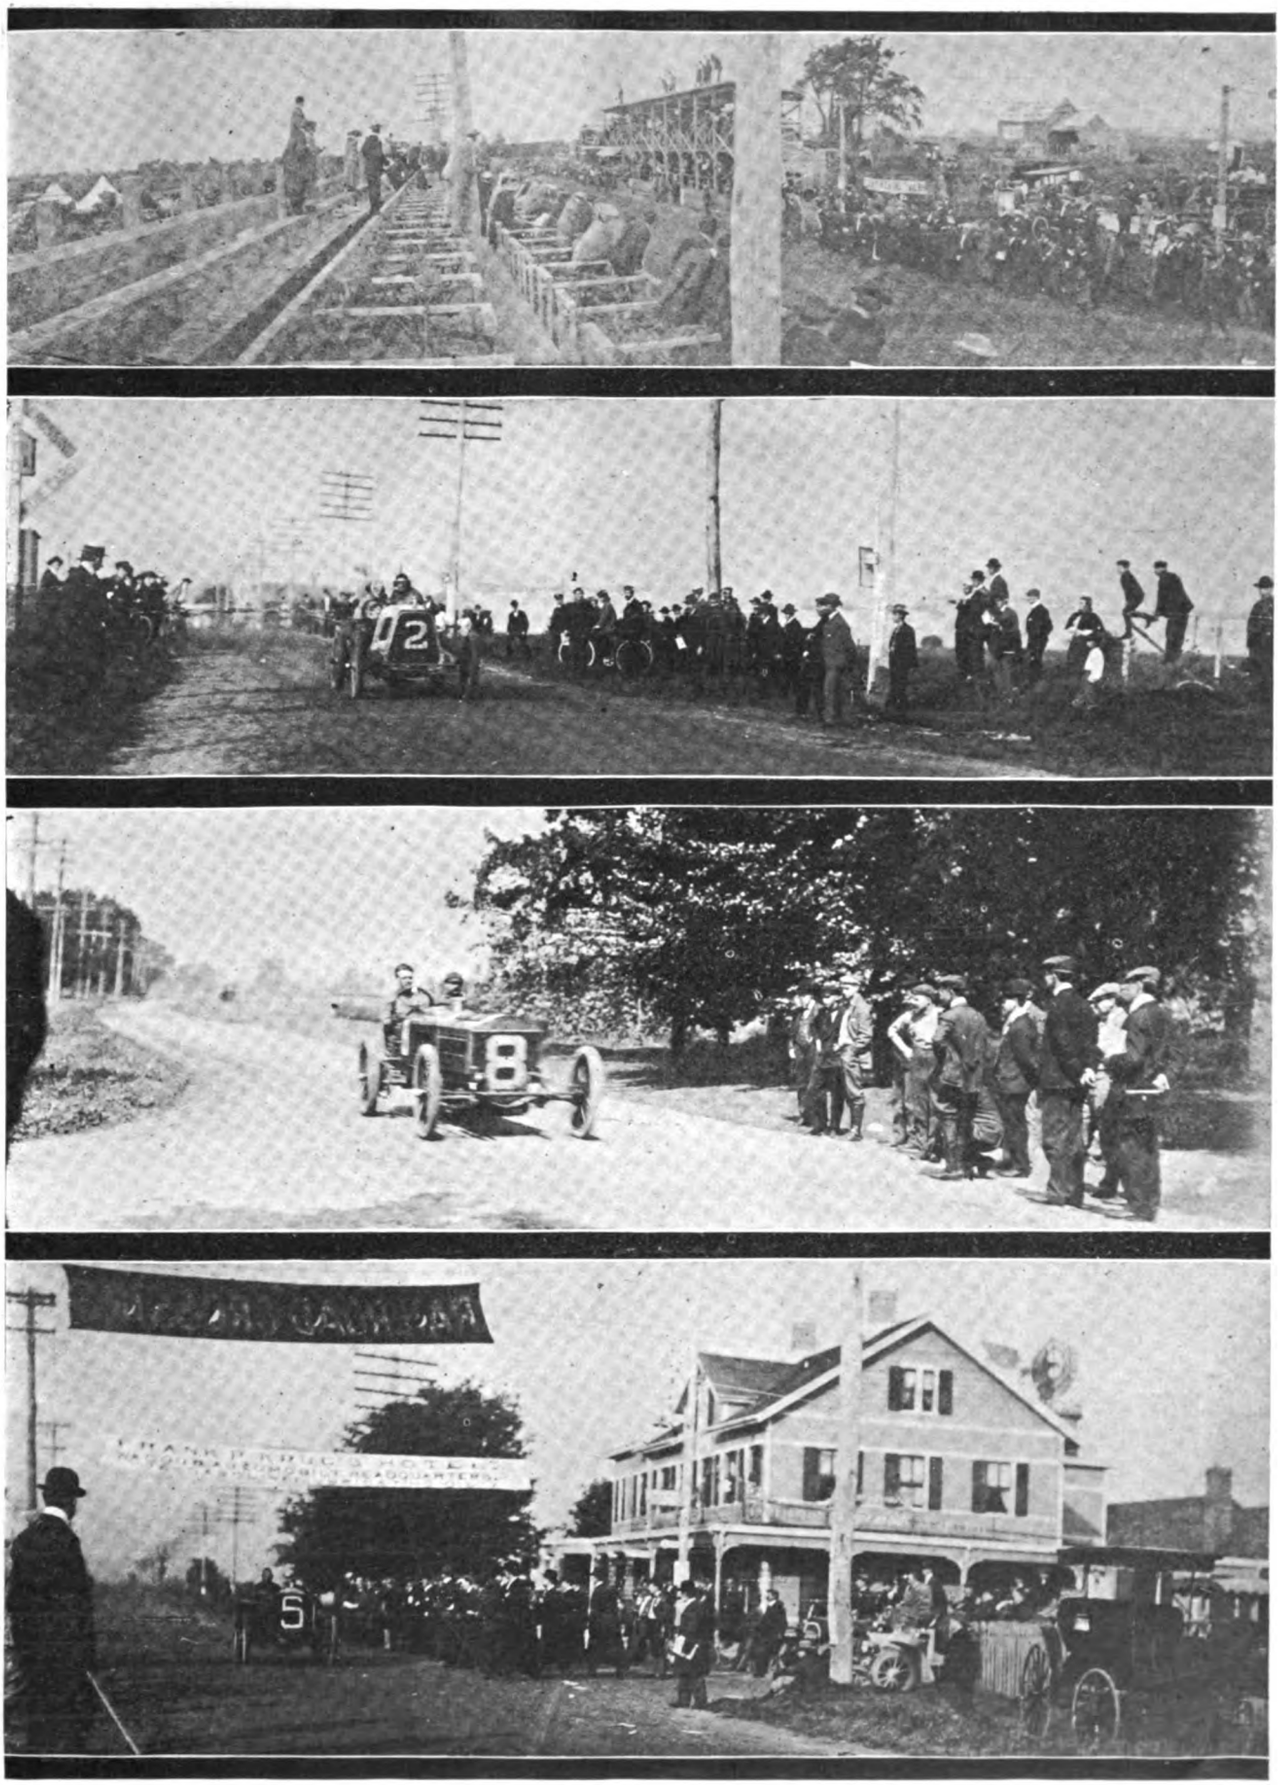
At eleven points on the course telephones had been placed, each connecting directly with a 'phone at the starting point. The latter 'phones were ranged in a row in the "first story" of the double decked press stand, situated exactly opposite the grandstand. At each 'phone there was an attendant, who kept his car glued to the receiver. There was an official at each of the other telephones on the route, and a lineman with his kit strapped on a motor bicycle ready for instant duty in case of interruption. As was the case during the race last October, this telephone service kept the grandstand and vicinity well informed of all that was occurring. The information that came over the wires was promptly shared with the public. The official announcer repeated all messages through his megaphone.

"No. 1 (Nutt) passed Jericho at 5:37," was his first announcement.

"No. 2 burst his tire at Jericho," which came a few minutes later, caused the first ripple. It marked the undoing of the unfortunate Christie car, and also, remarkable to relate, the only tire trouble of the race. The Christie driver later telephoned for permission to change a wheel, and the permission was granted with reservations. The change was made, but an hour was lost in doing so and the car, of course, was never a real factor in the contest.

Before he had started the message, "No. 2 passed the Guinea woods at 5:47," conveyed to Lytle—and to the crowd—that his stable mate, Dingley, had passed Nutt and was in the lead—a lead that he never lost save for a few brief seconds on the third round, when Tracy, in point of time, was clocked four seconds to the good.

The message also excited the curiosity of Referee Vanderbilt. When he heard it he approached a man who held a map of the course.



"Where are the Guinea woods?" he inquired, and this depsite the fact that his country estate is little more than five miles removed from them. The location of the woods was pointed out to him.

DINGLEY LEADS ON FIRST ROUND.

Possibly because the well informed Pardington was at his elbow Mr. Vanderbilt was less in the public eye than was the case last October. He mingled less and did not even look so chipper, but he wore the same old black satin smoking jacket with quilted lapels that he wore a year ago, and apparently the same riding breeches and puttees. He shuttled between the telephone booth and the box in the grandstand, in which were seated Mrs. Vanderbilt and a party of her friends. In the adjoining box were Albert L. Pope, whose car Dingley was driving; Arthur Pope, Charles E. Walker, H. A. Lienhardt and other of the Pope officials and lieutenants.

The message from the Guinea woods had quickened their interest, and when the first cry of "Car coming!" reached their ears, and a few moments later the Pope-Toledo, with

Digitized by Google

the big number "2" painted on its radiator, could be plainly discerned, the smile that followed lit up the surrounding boxes. When Dingley dashed past there was a hearty hurrah. When the megaphone announced 25:58—away inside a mile a minute—as the time A. L. Pope was so unexpressibly happy that he shouted:

"How is that for California?"

Dingley, be it understood, is a Californian.

Men who held stop watches glanced at their pieces again and again, and shook their heads as the announced time dawned on them. Several made their way to the officials, but it was quite a while before the correction was announced. There had been a mistake made of two minutes. The correct time was 27:58—and, notwithstanding, better than sixty miles an hour.

EXPANDING SMILE ON POPE FACES.

With each succeeding message—save one—and each succeeding appearance of Dingley the Pope smile became more expansive until at last faces became too small properly to contain it. The one shadow fell on it when the message came from East Norwich that Lyttle, on the second lap, was down and out with a broken sub-frame. The first story had it that he had run into a tree; but this proved not to be the case. By the irony of fate the mishap occurred when he was moving not at hurricane speed, but at a crawl of not exceeding three miles an hour. He had slowed for oil, and an error of judgment in the manipulation of his clutch had caused the irreparable damage.

If Lytle caused the Pope staff a pang, before he did so he gave the grandstand its first and indeed its only real thrill. It was on what proved his first and last lap. The monotonous cry, "Car coming!" was unexpectedly varied by a cry of "Two cars coming!" And they certainly were coming, the hindermost gaining on the leader at every revolution. They could be seen a mile away. It was a pretty sight, and the crowd fairly throbbed with excitement. As they came nearer it was seen that cherubic Lytle was coming hotfoot after the bearded Jardine. In the twenty-eight miles he had made up the six minutes that had separated them. If Jardine knew that Lytle was so close on his heels he gave no evidence of it. He held the centre of the road. Fifty yards from the grandstand the big Pope-Toledo swung sharply to the left; it cut deeply into the softer going, and the next instant flashed past the Royal, gained the centre of the road and, while the crowd cheered, opened wider the gap with every bound.

The long, red Thomas, with its boyish driver, had passed but a short time, and as it passed it shed fragments of something. E. R. Thomas, of Buffalo, its builder, and H. S. Houpt, its entrant, were there, but if they discerned trouble their faces did not show it—not even when some of the "wise ones" who had picked up the fragments and called out, "His battery box is broken." The car was running well and had made a fast lap, but it made no more of the same kind. The battery box had, indeed, given away, and to even finish the plucky fellows in the car had recourse to carrying the battery in their laps—that is, in the chauffeur's lap. Matters went from bad to worse. The coil also was injured, and the big car simply limped around the last lap. But two of the six cylinders were working, and instead of the deep base note that betokened full vigor there was but a weak irregular sound as of a giant seeking to stifle its sobs at its own helplessness.

E. H. R. Green, the great big, good natured Texan, was there, too, to see his big wheeled, high bodied, eight cylinder Franklin perform. He saw it once, and then it was seen no more. But that once was enough to show that its speed was not sufficient for such a battle. It was moving well, but it lacked the

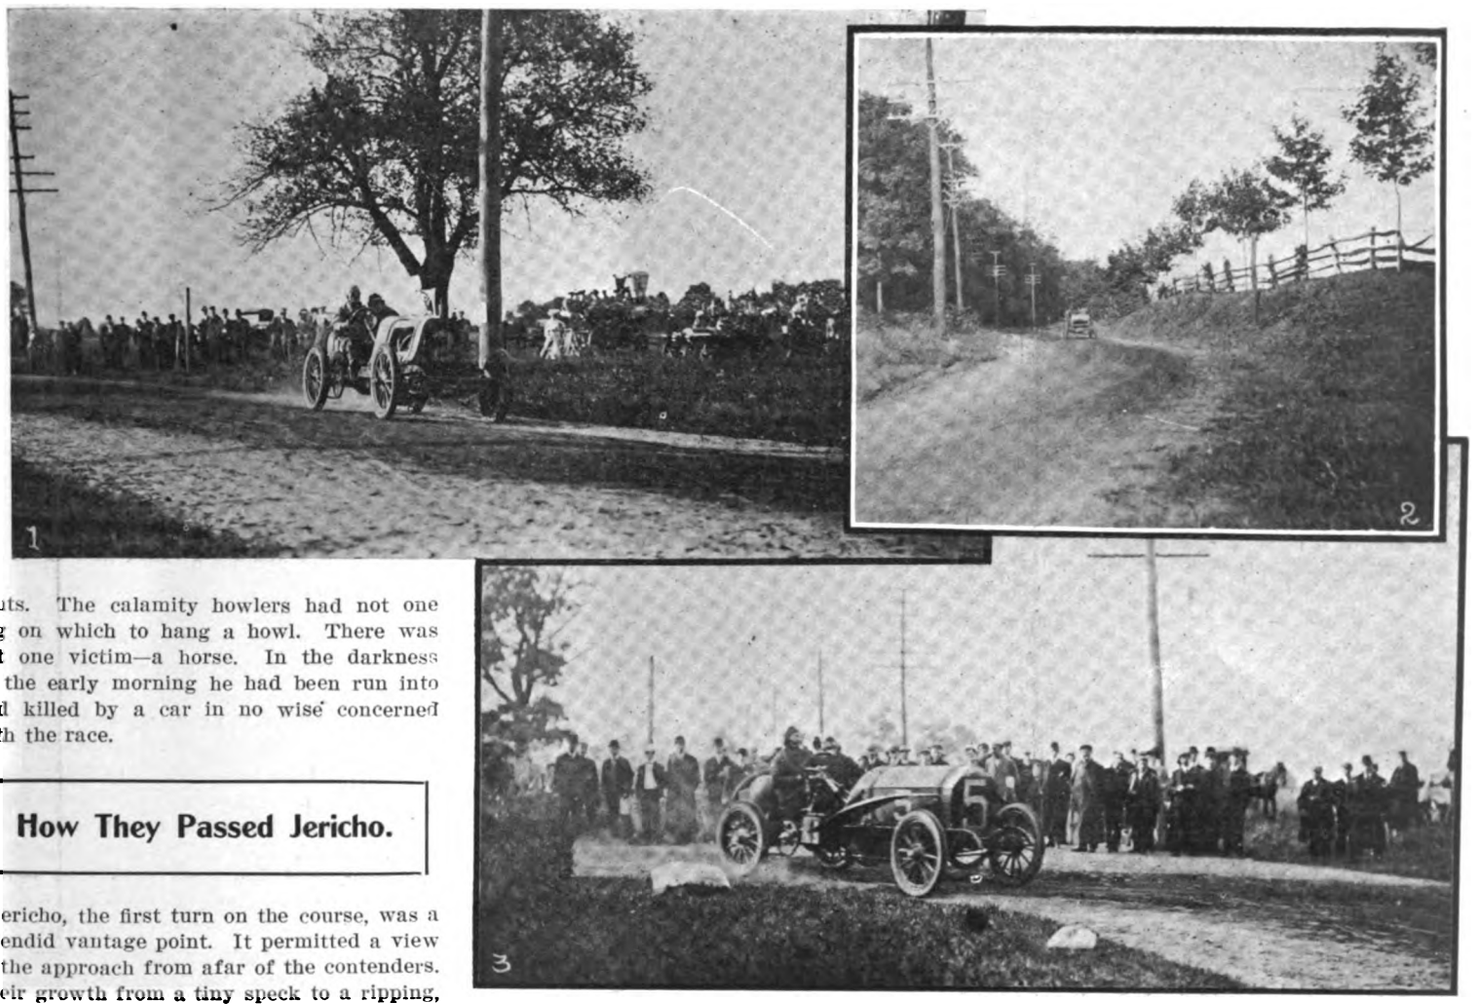
JOSEPH TRACY.

dash of the others. It cast a shoe, or rather a bolt, on the second round, the bolt penetrated its big stomach—its gasolene tank—and through the big hole its life blood ebbed and then it stopped, not to go again until tied to the tail of a car with a good stomach. For nearly two hours it was lost. The telephone brought no word of it, and after all was over its big owner went scouring the country for trace of it.

SOME EARLY ELIMINATIONS.

The White, a favorite though it was, had been wellnigh forgotten. Not until 6:14, when Jericho reported that it had just passed that point, was it recalled to mind. The toggle joint of a White touring car had been borrowed and a repair effected, but fate was against that car, for it had hardly got into its pace again when its water tank burst. With the water splashing out it sought to live up to its proud reputation, but the last hurt was fatal, and it crawled silently past the grandstand and became an elimination.

One car alone was not seen after it left with its flourishing roar—the Matheson, driven by Mongini. Some ten miles away its extemporized lubricating system failed of its purpose. The piston "seized" and it drew to the side of the road, to be numbered with the "also rans."



The second lap was the eliminating one. It was on that round that White, Lytle and Winchester went down and out, and though he came around long after, Robertson, in the Christie, might well have been out. He certainly was out of the reckoning. These four cars were all special creations built for this event. When account was taken of the survivors there was cause for amazement. Five cars remained—one, the Thomas, also a special racer, had been wounded and was limping, and of the other four, two were stock cars, the Haynes and the Royal—stock cars tuned to concert pitch, it is true, but stock cars, nevertheless. They were standing the gaff bravely, and it was plain would do what none would have dared prophesy—they were practically assured of third and fourth places. When the fact dawned on the thinking men it proved more than awakening—it was a revelation. Come what may in the big race of October 14, the American stock car was doing itself uncommonly proud.

TRACY'S HOT PURSUIT OF DINGLEY.

Dingley wore a broad grin and waved a hand gayly when he passed on the third lap. He had no cause for great concern. He had reason to feel chipper. He was in front and none had passed him. He might have felt a mite less larky in less than three minutes had he heard what the grandstand heard through the megaphone, just after Tracy flew by, i. e., that the man in the big Locomobile had gained four seconds on him. Dingley had had a bad minute or two on that third lap, but he made amends for it in the next and last one. He ran like a scared deer, and though Tracy also quickened his running Dingley regained those four seconds and fifty-nine others for "good measure." While the crowd cheered lustily and the Pope smiles in the grandstand reached behind the ears, the man from California dashed over the line the victor in a good race well run. He was acclaimed as a victor, though it was not until two minutes later that it was known that the victor's plume really belonged to him. Those two minutes were tense minutes. They ticked off slowly. Would Tracy come? He did come, and in dashing style. When as sixty seconds lengthened to one hundred and no speck or sound betokened his coming down the long straight road, in which direction all eyes were strained, it was seen that first place was not for him and feelings then relaxed. It was 2 minutes and 59 seconds after Dingley had crossed that Tracy came. He was cheered heartily, as he deserved to be cheered. He had driven as he had been ordered to drive—with caution, not too fast, not too slow, but fast enough to qualify. He did that very thing. There were cheers, too, for Jardine and for Nutt, and no men merited them more warmly. They had done what appeared impossible.

Then the crowd broke for home, and, as one of the natives expressed it, the travel on the roads became more dangerous than while the race was on. But there were no acci-

dents. The calamity howlers had not one peg on which to hang a howl. There was but one victim—a horse. In the darkness of the early morning he had been run into and killed by a car in no wise concerned with the race.

How They Passed Jericho.

Jericho, the first turn on the course, was a splendid vantage point. It permitted a view of the approach from afar of the contenders. Their growth from a tiny speck to a ripping, roaring, gigantic motor car could be plainly seen as they dipped now up, now down the gentle grades of the long, straight road. But Jericho was favored as a viewpoint rather because of its right angled turn, which gave promise of "happenings." The cars shot up a short, slight grade, turned abruptly to the left up a steeper grade, and made off toward East Norwich.

Frank Nutt, in the Haynes, was first to reach the point. He made the turn deftly. Dingley a minute later essayed it, and gave the little crowd a chill. He skids frightfully, and the wonder is that he does not upset. But he is away before thoughts have time to collect themselves. After Dingley there is a longer wait. Cars No. 3 and No. 4—the Matheson and the White—are already missing, and no news comes of the reason why. But Tracy—No. 5—he comes in dashing style, sweeps 'round the turn like a giant bird, and so prettily that there is a mild burst of praise. Next comes that Christie car, its forward wheels bounding from the road like a rubber ball. Watches show that it has gained on Tracy. The next instant, like a wounded beast, it staggers from side to side, limps off slowly, and then stops.

At Jericho, the turnpike forms a Y, one arm branches off to East Norwich, the other to Hicksville. In the triangle formed by the Y is a small grass plot, a tree and a post. To the onlookers, it appeared as if the driver of the Christie was suddenly seized with an attack of "rattles." He swerved dangerously toward the grass plot, ran over an iron pipe, narrowly missed the post, and while a shower of dirt was thrown over the spectators, he skidded fearfully around the uphill turn, almost crashed into a telegraph pole, and then straightened out. Its front tires had been literally torn from the rims. The car ambled down the road a short distance to a tire control and there it stopped. There followed some telephonic talk with the grandstand, and about an hour afterward the car restarted. When it came around again, the crowd scampered for cover. It arrived a third time about 8:20, when the race was over, and efforts were made to intercept it, but the driver seemed deaf to all shouts and blind to all signals.

On his second appearance, Dingley skidded worse than the first time, and came near to going to wreck against a telegraph pole. The others made the turn without incident. The Franklin took the curve very slowly, as did the belated White, when it finally arrived. Though they stepped off lively enough, both drivers appeared imbued with the it-is-better-to-be-sure-than-to-be-sorry spirit.

East Norwich and its Angle.

At East Norwich, which as far as the course itself is concerned consists of a right angled bend in the road, with the village postoffice for a turning point and a quarter-mile stretch of elm-shaded street, broad and picturesque in its setting of painted wooden houses, an even hundred people had foregathered when the official at the telephone announced that the race had commenced.

At 5:40 came the first cry, "Car coming!" and the next instant, from over the brow of the long grade on the Jericho and Oyster Bay road, there came into view a flying speck of black, which took shape like the image on a screen, and with wondrous haste assumed the form of a car in full flight. There was heard the roar of an open exhaust, and the crowd pressed forward, only to be crowded back by the police, threatening, cajoling, urging as the thing came on. "Number Two!" was the cry, and sure enough, it was the Pope-Toledo, with Dingley at the wheel. Already had he passed Nutt, "the man before." Sixty or seventy feet from the turn he cut out his motor and

Digitized by Google

coasted up, making a slight outward swing, and then, with a straight shot, cut the inner curb with but a couple of feet to spare, opening up the engine as he straightened out. The gravel laid diagonally outward from the corner gave out a great crunch, there was a shower of fine stones thrown up by the wheels, and he was gone!

The people rushed out to the course to watch the retreating form of the machine, as it swept from view down the street, but were crushed back by the guards as the warning, "Car coming!" swelled forth a second time. More slowly came this car, and seemed about to stop as the turn was reached. No. 1, Frank Nutt in the Haynes, driving with great caution, was sure of making no mistakes at that pace, and well he need be, for he had been over the tortuous course but three times before. At the corner, he was going scarcely faster than eight miles an hour, it seemed, where Dingley had been travelling fully twelve or fourteen. He recovered quickly, though, and slipped out of sight almost as soon as the other had done.

At 5:48 came the big Locomobile, fifth to start, roaring right up to within sixty feet of the corner, and then cutting out with a mighty display of pyrotechnics, as the big engine fired a couple of extra blasts and then quieted down. The turn was made nicely, and not until the car was full on the stretch was the ignition cut in again with a burst of willing energy that made the spectators gasp and "Ah!" in wonderment at the pent-up wrath of the monster.

PANICKY TIMES FOR WOMEN.

Interest was at a high pitch. Two girls at a window over a porch had come down on the roof, and stuck their feet in the gutter to keep from coasting off into a wondrous little bed of flowers in the yard below. They were mightily interested, and conversed in shrill tones with a couple of lads on the sidewalk. A man in brown overalls removed his languid bulk from the tree which had been supporting him since dawn, and disclosed a sign painted crudely on a bit of shingle, which read, "Stoop to let for the Auto Race."

"Car coming!" and with little yips of terror, three girls and two lads who had waadered on the road sought cover in the yard.

It was No. 7—the Royal—this time, cutting close in to the corner and skidding to the grass on the recover, but without other result than a mighty panic on the part of some womenfolk on the sidewalk, who skeddadled out of range with ridiculous celerity. Three minutes later, came the Thomas car, making a fast turn, but skidding slightly on the gravel. In a second more, it seemed, came Lytle, in the big Pope-Toledo, making the fastest turn of all. He drove splendidly, throttling his engine at the corner, but not cutting it out altogether, as had most of the others. Following directly behind him was the only air-cooled car, the long, high-built Franklin sputtering like a masked battery, and smoking like a blast furnace. This car made the slowest turn of all, but sprinted bravely into the stretch, only to slacken an instant later as the ignition failed.

At eleven minutes after six came the smaller of the two Pope cars, on its second round. The crowd gave a murmur of delight as the number was recognized, and drew back of its own accord as the machine bustled up to the turn at a much faster pace than before. The mechanician swung far out on the inside, as the machine slowed perceptibly, and then, as he caught a line on the curb, called "Right!" in sharp assurance as the driver, with hardly an instant's pause, dragged open the throttle and sent the machine whizzing around the corner amid a stinging shower of gravel, which pelted the crowd ten feet or so away.

On its first appearance the "White" machine ran but indifferently. The driver

NOT NIGHT GOWNED MONKS, BUT LYTLE AND HIS CHAUFFEUR.

seemed equally doubtful of the turn and of his car, for he shut off away back on the grade, and wavered perceptibly as he approached the corner, only giving steam as he made the turn. As he straightened out, however, the blower was opened, and the car shot away out of sight with a rapidity that spoke of wonderful accelerative power, and as the wail of the escaping steam rose to a shriek in the distance, of speed capabilities that placed it in the forefront of the fast machines.

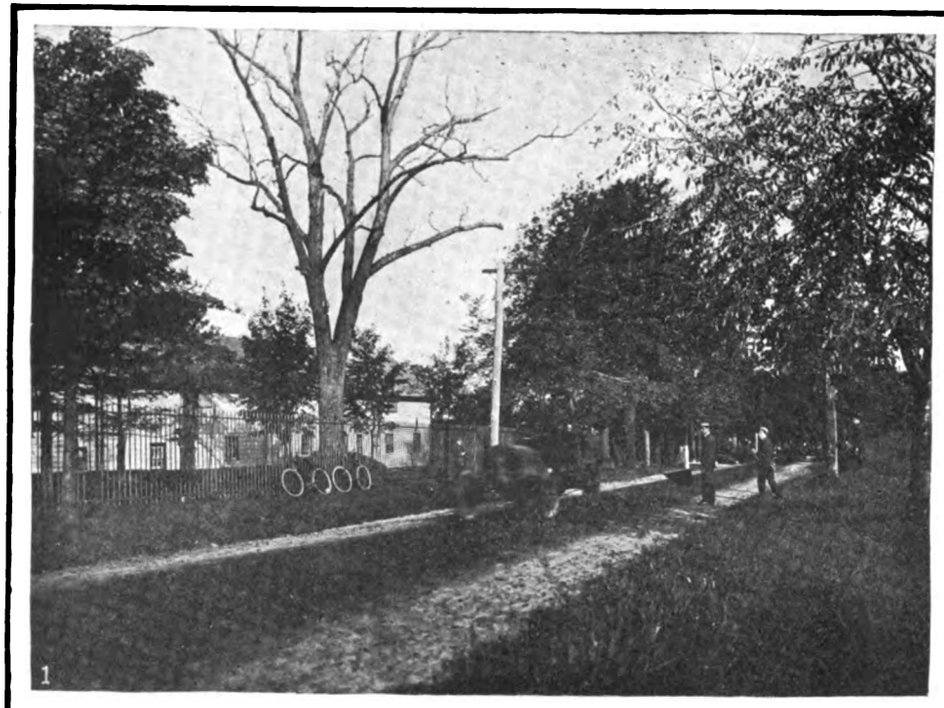
Throughout the race the handling of Dingley and Tracy far outshone that of any of the others; the former in dash and vigor, and the latter in caution and supreme confidence. Lytle drove magnificently during the first round, and then, here at East Norwich, he fell miserably through an error in judgment. On the first round he had called out to his supply station for oil, but had not stopped for it. On the second, however, he slowed down, evidently with the intention of coming to a full stop, but as he swung to the side of the course, the attendant handed up a can of oil before the machine had come to rest, and Lytle—fatal error—let in the clutch without changing gear. There was a groan of strained metal for an instant, and then a crash as the universal joint gave way, and the car was out of the game.

Presently those at the corner were treated to a sight of a very little man clad all in leather, who wore an exceedingly worried air and asked for the use of the 'phone. After a moment's delay, a connection was made and the little man was heard calling for "Mr. Keating."

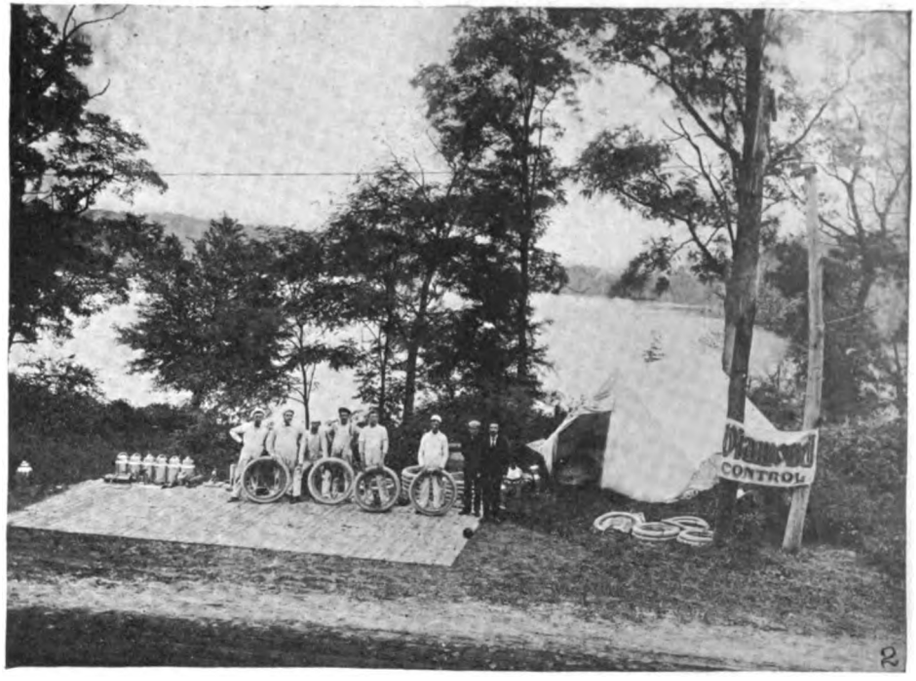
"Mr. Keating," he said, "this is Lytle. I—I've broken my sub-frame. Yes, I'm out of it."

And with something like a groan he hung up the receiver and turned away. Pursued and questioned by two or three newspaper men, he was silent at first, but on being asked directly what had been the cause of the accident, he said simply, "Too much power," and turned away. Later, as he was leaning against a fence and sadly contemplating the result of a moment's excitement, he remarked in wonderment, as if he hardly could comprehend the cause, "Who would have thought that would have happened?"

On inspection, the car was seen to be badly injured. The universal joint in the driving shaft, between the engine and transmission, was broken, both members being minus one of the jaws. The crank-case was split open on the right hand side as far as the second cylinder, and the gear case was cracked across the top, showing the gears within. The side members of the frame were sagging fully two inches at the centre, and this allowed the rear portion of the engine to settle toward the road. The pedal control shaft was adrift at the outer end, and sagging badly.

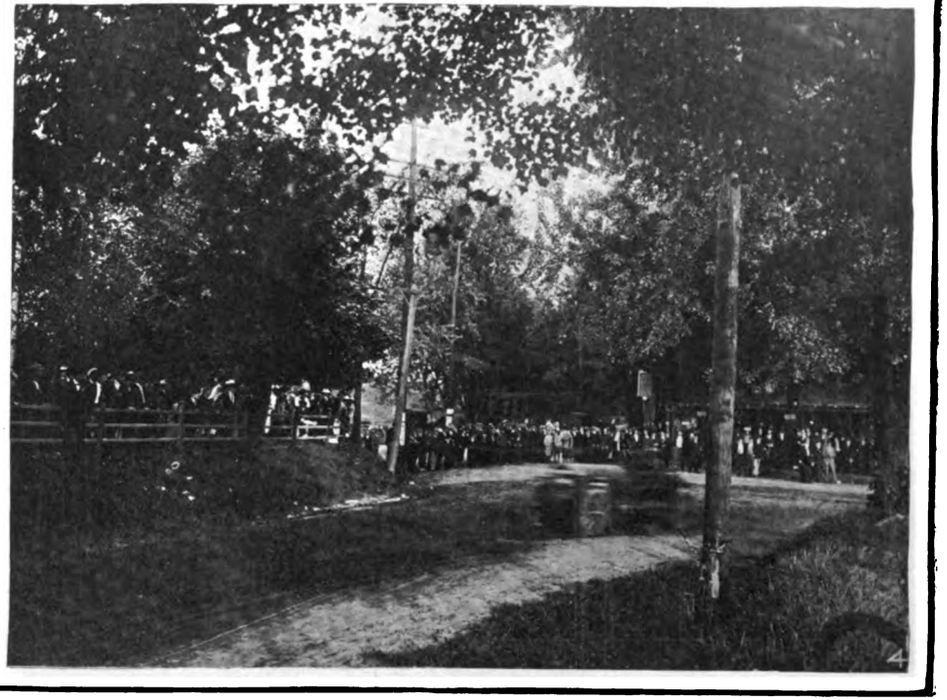


LYTLE'S CHAUFFEUR GROWS ABUSIVE.



As Lytle returned from the telephone his mechanic, who had a moment before been blubbering out his chagrin to the tire men in a nearby tent, rushed up to him and assailed him with all manner of stinging reproaches.

"You're a —— of a fellow to be put in charge of a car. You're not fit to drive a runabout." This and very much more did the chauffeur spit out to relieve himself of the ungracious spleen of an underling whose champion has lost. Lytle bore the abuse without remonstrance. He accepted it in silence as if no word of it reached his ears.



Thereafter, the time dragged till the finish. Some little interest was aroused when, at 7:10, just before Dingley appeared on his fourth round, the Christie car made its first appearance. The speed was but indifferent at the turn, and the engine was skipping slightly as the machine rounded into the stretch and accelerated. Moreover, the front end, weighted down by the concentrated load of the engine, was pounding badly at every bump in the course, and made the car seem ill-balanced. Dingley was received with a round of cheers as he passed his stalled and disabled stablemate for the last time, and

the two men riding to victory waved a reply as they rushed down the slight decline at that point. The mechanician was pumping oil vigorously, and the engine worked so smoothly that none could doubt the car would win.

At 7:15 the familiar cry was raised again, but this time no car swung into sight around the turn. Instead, came a wan little fox terrier, running wild in doggish terror, with stubby little tail hugged tight as if urging his hindermost parts to equal exertion with the two little front feet, which pattered so briskly on the hard oiled surface of the road. From either side came catcalls and howls, while now and then a bit of a stone would skip along in his wake, carrying a new fear to the canine heart. As he disappeared around the bend below the tire camp, more calls were heard, and a big negro boy standing by cried, "Ma Gawd, he done runnin' yit!"

About the time the news was heard that the Franklin had turned off the course for the last time, the Royal passed on its fourth round, with the cap missing from the radiator top, and a cloud of steam floating back into the driver's bearded face. The radiator showed a bad dent, too, but it was not known until some time later just what had been the cause. On the previous lap Jardine, in negotiating the ticklish double S curve near Albertson, had spilled. As his car fell on its side, he and his chauffeur were thrown out, but quickly realizing that no serious injury had been done, the car was righted, and in less than three minutes the plucky fellows were under way again. Car No. 8, on its last round, was barely creeping along on two cylinders, aided spasmodically by one or two more, when it came to the turn. The recover into the stretch was made badly, with the result of a skid to the grass, but the speed was not great enough to cause damage. At 7:40 came the Christie once more, lazily drawing up to the turning point and coasting until the stretch had been made. Then it accelerated slowly, the clutch wailing pitifully the whole.

TOY CAR CAUSES COMMOTION.

Fifteen minutes later, a little toy car crept out into the road from some hiding place or other, and began to meander along, evidently in the direction of home. Unfortunately for the intentions of the driver, however, something went amiss, and the contraption came to a halt after a couple of erratic spasms which convulsed the bystanders. "Car coming!" cried a wicked one, and thereupon the driver jumped down and began to labor to shove it off the course. He was a tall, anaemic looking individual, clad in pale trousers distinguished by their length of leg, and a cute little black cutaway coat, which reminded one of Sunday and the collection box. Aided by several of the kindhearted ones, he at length succeeded in getting his little "ship" out of harm's way, and then, taking from under the front seat a formidable crank fully two feet in length, began to labor with the disorganized vitals of the thing. Six or seven turns of the crank, given with great vigor, brought forth unexpected results in the shape of a snappy backkick which kept the flywheel turning for several seconds.

Meanwhile his women folk, two in number, not counting a little girl, were scrambling out in panic stricken haste, with many ejaculations of "Mercy me!" and the like. Gaining the sidewalk, they congratulated themselves on their narrow escape from a horrible death, and were still much perturbed when the wee little cylinder once more began to chug forth its merry note. They all had piled in and started off amid a most marvellous howling of the gears, when there came from the direction of the telephone the news that the race was off, and that the last car had passed.

At Lakeville's Mean Turns.

At Lakeville, where because of two mean turns it was thought there would be "something doing," disappointment was the lot of the watchers for the significant "something." Excepting a few bad skids, which for the time being appeared dangerous, nothing of moment occurred. The Diamond and Goodrich tire controls were there, but the men had nothing to do but "look pretty." The Goodrich tent was pitched in the field opposite the Vanderbilt country house, and the Diamond camp was further down the road on the bank of Success Lake. The Diamond men did "look pretty," too. All were attired in white duck suits, and, though tires and supplies were stacked on the platform in front of the tent, for instant use, they were unnecessary.

Lakeville was, perhaps, one of the most interesting points on the course. A mile or so below the crossroads the road was particularly crooked, and great possibilities seemed to lurk. The oil and rain of Thursday night had made the surface somewhat slippery, and none of the drivers took chances—all seeming content to cover this part of the course at slow speed. Further on the road formed the first bend of the so-called "hairpin curve." This curve was banked—a rather wise precaution—for, had the drivers attempted to negotiate it at full speed, they and their cars would have gone off at a tangent over the bluff and would doubtless have been dashed to eternity in the woods below. From the first curve to the crossroads at Lakeville the road was practically straight. Here the course turned at right angles to the left, and, continuing, described a wide sweeping curve around Success Lake at the Vanderbilt farm, and thence straight on to Hyde Park, when it again bore to the left toward Mineola.

Quite a crowd collected at the crossroads, and it was early made evident that the White and Locomobile cars ,with White and Tracy, were favorites with the Lakeville contingent. Their camps were established in this vicinity. At the crossroads the course was roped off, and the special officers had no trouble in keeping the several hundred spectators back of the lines.

The cry, "Here comes the Haynes, No. 1," shouted by an official with a megaphone, was the first signal that the watchers and waiters had that the race was on.

The cry went up again, and the spectators pressed closer to the guard ropes that held them off the course. And "she" certainly did cover the straight road which led up to the turn in an amazingly short length of time, but "she" did not happen to be the Haynes. "No. 2" was painted on her radiator, and a hurried glance at the programme showed that "No. 2" was the 50 horsepower Pope-Toledo, with Bert Dingley at the wheel. Dingley took the right angled turn in fine style, grasped the lever on the side of his car, threw it into high speed, and before one could say "Jack Robinson" was lost to sight in the distance. It was then lacking ten minutes of 6 o'clock.

Just five minutes later Frank Nutt, in the Haynes car, appeared. Nutt was plainly nervous. He did not turn soon enough, and attempted to take the sharp curve at full speed, and the little car slewed over to the right side of the road, while the right wheels went up the bank. The crowd held its breath in suspense, but Nutt was soon on the level again and away up the road. Joseph Tracy, in the 90 horsepower Locomobile, was the next, and the big car skidded very little as he rounded the curve. The crowd recognized the intrepid "Loco" man, for they yelled "Tracy!" "Tracy!" The driver acknowledged the acclamation by smiling and nodding his head.

"WHERE IS THE WHITE?"

"Where is the White steamer?" somebody anxiously cried, and immediately the entire crowd was aroused. The steam car was scheduled to start before the Locomobile, and the latter had reached Lakeville first. There must have been an accident. The man who had charge of the telephone booth had been resting on the hotel porch and watching the cars go by, the unobserved of all observers. Now, however, he was the most important personage at the turn. He rushed to the telephone.

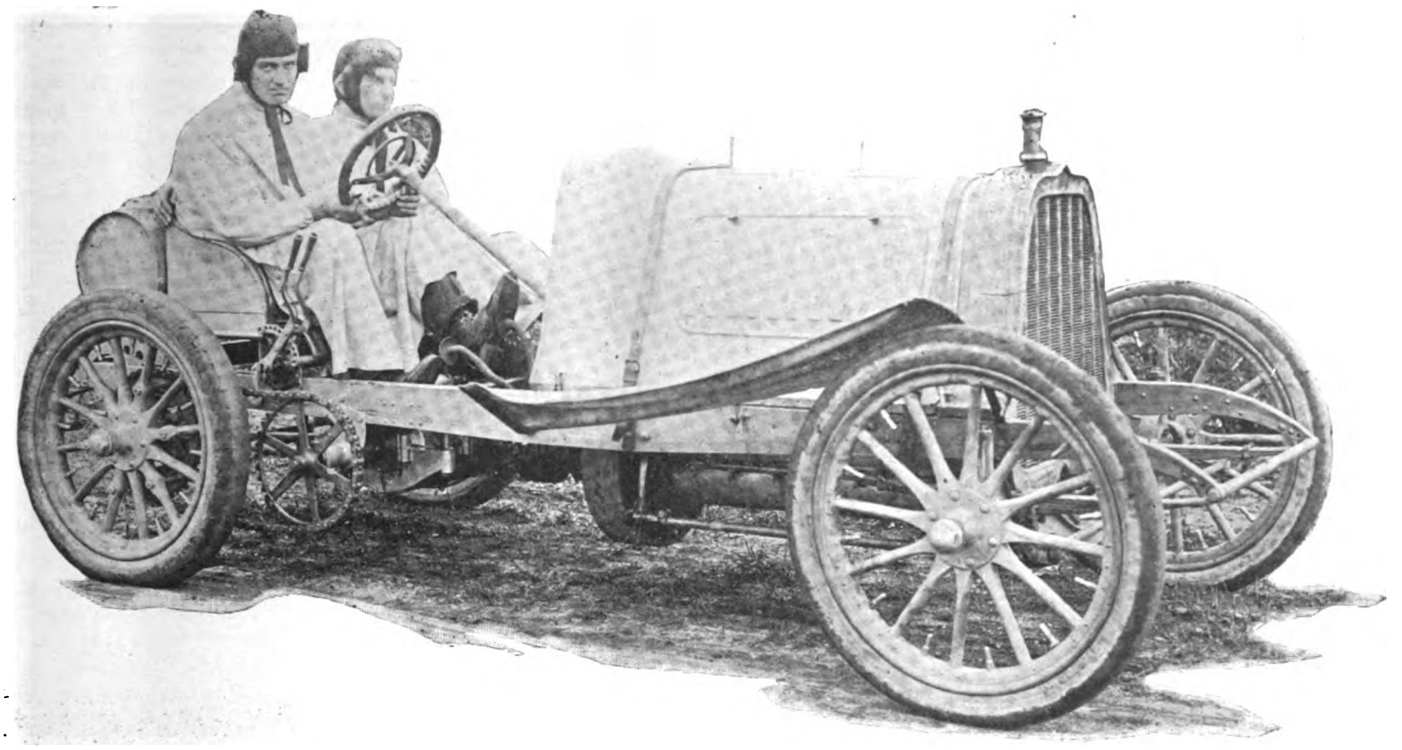
"Hello!"

"————————"

"Where is the White steamer?"

"————————"

"Has it met with an accident?"



"————————"

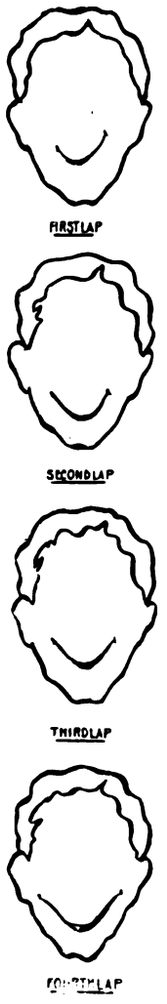
The crowd pressed closer to hear the one-sided conversation.

"You don't know?"

With a mingled sigh of regret and disappointment the crowd melted away. No one knew what had become of the favorite, and the telephone man hung up the receiver. As "No. 8," the new 60 horsepower Thomas, driven by Montague Roberts, the youngest chauffeur in the race, arrived next, the spectators felt sure that an accident had put Walter White in the steam car out of the

Digitized by Google

DINGLEY AND THE TRIUMPHANT POPE-TOLEDO.



running. Roberts handled his car well, and negotiated the turn in clever style. It was then 6:05 a. m.

Two minutes later the crowd had another mild attack of heart trouble. Robert Jardine, at the wheel of the Royal, tried the trick Nutt had tried—that of taking the turn without shutting off power. That he did not come to grief was due to a kind Providence and his own nerve. The car slewed around and ran up the bank, missing a telegraph pole by only a few inches. Jardine's face was deathly pale, but he kept a cool head and followed his predecessors toward Hyde Park. Only ten seconds elapsed before the big Pope-Toledo, driven by "Midget" Herbert Lytle, came thundering up the road. The car was running beautifully, and Lytle took the curve easily.

Two little girls, who had been standing on the steps, apparently daughters of the proprietor of the corner hotel, went inside and started a hymn, accompanied by a squeaky melodeon. Only two or three strains of "He leadeth me" were wafted through the parlor window, when a cloud of dense blue smoke was noticed down the road.

Here comes a car afire," remarked some one, as a cloud of smoke was s n approaching. Immediately the remark was repeated, but when the smoke took form it proved to be the eight-cylinder Franklin, and it certainly was sputtering and smoking like a furnace. Indeed, the eight cylinders, placed tandem, with dense clouds of smoke pouring from each, gave the car an unnatural appearance. It was missing badly.

"Why do they have so many cylinders?" asked the Seekerforinformation of an apparently intelligent automobilist standing near a car parked by the roadside.

THE POPE SMILE.

"Why, you see, it is an air cooled car, and the driver uses the first four cylinders until they get hot, and then he shuts them off and uses the rear four. By doing this the cylinders do not get hot all at once, and so he is able to run well all the time."

One thing is certain. Winchester never appeared in Lakeville again with the Franklin car during the race. After the race a touring car dashed up to the Diamond tire control above Lakeville, and in it reposed the corpulent, albeit jovial, Texas colonel—E. H. R. Green—who owns the Franklin. He really looked worried, something unusual, by the way.

"Have any of you boys seen my Franklin car?" he inquired. "I have been all around the course, but I'll be doggoned if I can discover hide nor hair of it." Not a soul knew the sad fate of the Syracuse car.

At 6:21 a. m. Dingley, in the smaller Pope-Toledo, again came around. A glance at the watches showed that he was holding his own splendidly. He was driving a consistent race, and when he turned at Lakeville the spectators cheered lustily. Then followed the Locomobile, ten minutes later, it, too, on its second lap. Still no sign of the White. The crowd did not have long to wait, however, for at 6:33 the big steam car crawled up the oiled stretch and limped around the turn, going less than ten miles an hour. Water splashed from its tanks in front, and the watchers realized full well that an accident of some kind had befallen it, for the "Pride of them all" seemed, so to speak, on its last legs. The average racegoer is, to a high degree, extremely sympathetic, and, although the White car was virtually out of the running, its driver, Walter White, was given an ovation that must have caused his

heart to warm, notwithstanding he was beset with difficulties. A sad smile flitted across his countenance.

One minute later Nutt's car, the Haynes, was sighted, and it was followed by the Royal Tourist and the Thomas. All were running smoothly.

When, at a few minutes before 7, Dingley reached Lakeville, thrice around, everybody knew that, barring unforeseen accidents, the little Pope-Toledo would score a victory. The Thomas, Haynes, Royal and Christie cars followed at intervals of about six minutes. It was the first circuit for the last named, the direct drive car, but at Lakeville it was exploding regularly.

At 7:25 Dingley, in the Pope, reached the Lakeville deviation on his last lap, and a cheer went up from the multitude. When the Thomas car reached Lakevile in the last lap it was running on two cylinders, and it could be plainly seen that Roberts was having his troubles. His mechanician was holding the battery box in his hands, while the driver himself was steering with one hand and tinkering with the engine with the other.

About a mile and a half below Lakeville, where the course takes a serpentine reverse crook through a deep cut, a rather amusing incident happened. Just where the road cuts through a hill a small byroad joins the pike. On the top of the fifteen-foot bank which guards the course, and at the very point made by the junction of the branch road, stands a well developed locust tree. To this came a photographer when the race was half run, looking for a vantage point from which to snap the passing contestants. Being of an original turn of mind, he was in search of a unique point of view, in order that his pictures might bear the stamp of his genius. Therefore the tree was just to his liking. Accordingly, by dint of much scrambling, and notwithstanding many pricks from the

THE ONLY VICTIM.

protesting thorns, he shinned up the trunk, with the carrying strap of the camera firmly gripped in his teeth. With infinite pains, and not without one or two narrow escapes from a fall this worthy at length reached the stout limbs half way up the tree. Balancing himself with great care upon his swinging perch, he poised his picture box for a shot as the approaching roar of a car was heard coming up fast. And then, just as the car swung into view with a swish and a roar, the limb broke, and in less time than it takes to tell it the terror stricken man lay prone on the ground, with his head and shoulders projecting over the edge of the bank, more scared than hurt and more scratched than bruised. What his thought were when the car flashed by underneath him and he nearly ready to fall down on it he never told. The oily smoke wafted up to his nostrils no doubt gave him a grim foresight of the hereafter.

City Can't Stop Track Racing.

Replying to the councilmanic resolution requesting the preparation of an ordinance to stop automobile racing on circular tracks, City Solicitor Baker of Cleveland, Ohio, has formally decided that the City Council has no power. He says the council can only regulate automobiles on public streets.

Where Travel is a Delight.

Many men of many minds are all agreed upon one point: The service of The Lake Shore Railway is as near perfection as it is possible for brains and money to produce. Safety, comfort and speed are the keynotes of the road, and safety, comfort and speed have been attained to a degree never before reached in all the history of railroading. Wise travelers know this to be so and take particular care that their tickets read "Via the Lake Shore."

HENRY'S CAR TURNS TURTLE

One Accident Mars New Jersey Racemeet—Good Attendance and Good Contests.

Success from a competitive standpoint marked the second annual race meet of the New Jersey Automobile and Motor Club, of Newark, N. J., at the Waverly track last Saturday afternoon. Delightful autumn weather, clear and cool, made it perfectly pleasant, and a large crowd turned out to witness the sport.

The only occurrence to mar the pleasure of the meet was the accident that happened at the start of the second event. Chester C. Henry, City Clerk of Summit, was pinned beneath his car, which turned turtle, and he was severely injured. The mishap occurred when the contestants were getting under way in the five-mile race for members only. Henry was driving a new Cadillac, and he came up the stretch with the other contestants, when the signal was given for a restart. The other drivers turned around, but Henry elected to go around the track. Entering the backstretch, he threw on full speed, and his car swerved and turned completely over. The driver had no chance to escape, and was pinned down underneath the machine. Dr. James R. English, the president of the club, attended the injured man, and found that he had sustained a broken nose and three fractured ribs, besides injuring his spine.

It is not known just exactly how the accident happened, but it is thought that one of the front tires became loose or went flat. The car was badly wrecked. Bernard M. Shanley's 40-45-horsepower Mercedes crossed the tape first in the five-mile event for members. H. C. Hennit, 12 horsepower Franklin, was second. Time, 8:03¾.

J. W. Ward, driving a 22 horsepower Buick, scored a decisive victory over S. D. Atkinson, in a Franklin, in the five-mile event for cars from 10 to 20 horsepower. Time, 7:58. Two Pope-Hartford cars lined up for the three-mile race for single cylinder machines, and it went to C. S. Howard in 5:47½.

B. M. Shanley's Mercedes won the ten-mile free-for-all, and S. D. Atkinson, in a Franklin, was second. Time, 15:26½. A 22 horsepower Jackson, driven by Charles W. Cathout, finished first in the five-mile event for regularly equipped touring cars carrying four passengers. Dr. James B. English, 24 horsepower Winton, was second. Time, 9:00¼. With one minute handicap, J. W. Wilkinson, driving a 10 horsepower Autocar, crossed the tape first in the three-mile handicap, with H. Belden, 19 horsepower Ford (9:45) second. H. J. Koehler, in a 22 horsepower Buick, started from scratch and scored third. Time, 4:17. The summaries:

Five miles, open, for motorcycles—P. H. Johnson, 1¾ h. p. Indian, first; Aaron Reid, second. Time, 7:19.

Five miles, for members only—B. M. Shanley, 40-45 h. p. Mercedes, first; H. C. Hennit, 12 h. p. Franklin, second. Time, 8:03¾.

Five miles, for cars from 10 to 20 horsepower—J. W. Ward, 22 h. p. Buick, first; S. D. Atkinson, 12 h. p. Franklin, second. Time, 7:58.

Three miles for single cylinder cars—C. S. Howard, 10 h. p. Pope-Hartford, first; George Robison, 10 h. p. Pope-Hartford, second. Time, 5:47½.

Ten miles, free-for-all—E. H. Fredericks, 40-45 h. p. Mercedes, first; S. D. Atkinson, 12 h. p. Franklin, second. Time, 15:26½.

Five miles, for touring cars, regularly equipped, carrying four passengers—Charles W. Cathout, 22 h. p. Jackson, first; Dr. James R. English, 24 h. p. Winton, second. Time, 9:00¼.

Three miles, handicap—J. W. Wilkinson, 10 h. p. Autocar (1:00), first; J. H. Belden, 10 h. p. Ford (0:45), second; H. J. Koehler, 22 h. p. Buick (scratch), third. Time, 4:17.

Only Five of Fifteen Survived.

Fifteen members of the Kansas City Automobile Club started forth on the morning of September 10 on a hundred-mile road tour. That night, when the stragglers had gathered about the banquet prepared in their honor, there were found to be exactly five survivors of the mud and rain which had turned the race into an endurance contest of the proverbial order. Of these, three had driven White steamers, one a Cadillac and one a Rambler. The remainder of the party was either marooned on the road or laid up in convenient barns along the way.

The course was laid out to Oak Grove and return by way of Hickman's Mills, Lee's Summit and Lavasy. The outward trip had been uneventful for the most part, and all the cars had arrived in season for the luncheon which had been set out for the occupants. On the return, however, the rain began to fall with most dubious effect on the clay roads, and before long the highways were scarcely passable.

H. C. Merrill, last to start, was the first to finish, having made the trip nicely carrying three passengers. Of the others who finished, Wilkins Taylor, carrying four passengers in his White, came in second, and S. T. Stinson, with four up in his Rambler, was third. Seventeen persons in all sat down to the banquet which had been laid for thirty-three, but most of them reported their cars as laid away in the wilderness awaiting fair weather and a few repairs as well.

Dewar Cup Trial Course Selected.

Quite a master stroke was made this week by the sponsors for the Dewar Cup when they secured permission to hold the second annual mile trials on the Coney Island Boulevard, in Brooklyn. Although probably not so fast as the Florida beach, fast time ought to be made on the broad, straight boulevard, and its accessibility will, no doubt, attract thousands to the course. The date has been set for October 18, and as all the crack contestants for the Vanderbilt Cup will be here and will likely compete, the trials ought to prove well worth while.

PLANS FOR ECONOMY TEST

Dates, Distances and Conditions for New York Motor Club's Six-days Competition.

Announcement is made of the conditions to govern the six-day economy test for automobiles to be promoted by the New York Motor Club on October 23 to 28. The objects of the test are plainly set forth to demonstrate how economically persons may be transported between given points in motor vehicles.

There are to be five classes in the competition, arranged according to selling prices of contesting machines, as follows: Class A, for cars not exceeding $750; Class B, for cars in excess of $750 and not exceeding $1,500; Class C, for cars from $1,500 to $2,250; Class D, for cars from $2,250 to $3,500; Class E, for cars exceeding $3,500 in selling price. To insure the proper classification of entrants, manufacturers will be required to accept orders for duplicate cars at the entered prices.

The dates and distances of the daily runs are given as follows: October 23, New York to Philadelphia, 90 miles; October 24, Philadelphia to New York, 90 miles; October 25, New York to Albany, 150 miles; October 26, Albany to New York, 150 miles; October 27, New York to Southampton, L. I., 101 miles; October 28, Southampton to New York, 101 miles. Total distance, 682 miles.

The basis of the charges for purposes of comparison and award are to be made on the following railroad fares per passenger: New York to Philadelphia and return, $4; New York to Albany and return, $6; New York to Southampton and return, $4.53. Total per passenger, $14.53.

Gasolene and lubricants are to be charged for at current rates, and supplies may be taken on only in the presence of official observers. Repairs are to be charged for at a rate per hour to be determined. Heavier charges will be made if repairs and adjustments be made by any one other than the driver of a competing car.

The route to Philadelphia and return will be via Staten Island, Perth Amboy, New Brunswick and Trenton; that to Albany and back will be along the regular Hudson River roads through Peekskill and Poughkeepsie; a south shore route will be followed to Southampton, and a north shore route in returning from Southampton.

An unusual rule, the operation of which will be watched with interest, is that no competing car may pass another on the road without the consent of the observers on both machines. The object of this is to prevent speeding.

Automobile School for Californians.

On November 1 the Y. M. C. A. of Los Angeles, Cal., will open an automobile school, which will be conducted jointly under its own auspices and those of the Automobile Club of Southern California, the latter organization recently appropriating the sum of $1,000 for the purpose.

TO TEST COMMERCIAL CARS

Germany to Have a Series of Practical Trials—Ten Classes Provided for.

Commercial vehicle and automobile omnibus trials will be held in Berlin, October 9 to 14, under the auspices of the German Automobile Club. The vehicles will be divided into various classes. In the first will be omnibuses built to carry ten passengers each, besides the driver, and 55 pounds of luggage per passenger. In the second class will be vehicles the same as those in the first class, but which have been in use at least three months, and which must be entered by the owners. In the third class will be commercial cars able to carry a load of 2,200 pounds. In class four will be cars of the same capacity, but which have been in use at least three months and are entered by their owners. In class five will be trucks, vans and other vehicles of a capacity of 6,600 pounds. In class six will be vehicles of the same capacity, but which have been in use at least three months and are entered by their owners. In class seven will be vehicles of a capacity of 13,200 pounds. In class eight will be vehicles of the same capacity, which have been in use at least three months and are entered by their owners. In class nine will be trucks, vans and other vehicles with trailers, able to carry a load of at least 6,600 pounds. In class ten will be vehicles of the same kind, but which have been in use at least three months and are entered by the owners.

The competition will consist in daily runs, the vehicles carrying full loads. Those in the six first classes will have to cover 100 kilometres—62 miles—daily for six days; those in the other four classes will cover only 70 kilometres—43.5 miles—daily for six days. The trials will be held upon roads which would ordinarily be covered by the vehicles in service. Manufacturers or owners may enter as many vehicles as they wish, but not more than two of the same class.

In the awarding of prizes, the following points will be taken into consideration: Ease of operation and safety; speed and smoothness of running; construction and durability of tires; constructional execution and durability; degree of annoyance through odor and noise; relation between weight of the vehicle and its load; regularity of operation; consumption; repairs; ease of making immediate repairs and changing parts liable to wear and tear; arrangements to overcome ice and snow; time required to start the vehicle and manipulation in general; value of vehicle; collective results in comparison with horse-drawn vehicles.

Missouri Motorphobes Get Together.

Missouri has stepped into line with New Jersey in forming a refuge for disgruntled motorphobes. A motorphobic convention was held in Mexico, that State, on Saturday, 23d inst., and was attended by one thousand men and women. A number of talks were made, all derogatory to the machines. Some of the white headed citizens present threatened to use powder and ball or pitchforks in fighting the automobile. These "citizens" also threatened to boycott the county papers, should they support automobile owners too strongly. All the talks were full of redhot phrases against the machines and their owners. The resolutions adopted called for regulation of speed and to have owners bonded so they could be made to pay for all damages. Naturally, a committee was appointed to present these resolutions at the next session of the legislature.

Leicester's Constable Again on Warpath.

Massachusetts and her little blue law townlets are becoming positively rabid on the speed question, and it speaks well for the general good behavior of the inhabitants that there is no outbreak of crime while the police are so actively engaged in attempting to prevent the greatest crime of the calendar, speeding a car above the funereal pace set by the petty municipalities.

The Leicester constable who achieved considerable notoriety at the expense of the Glidden tourists, and has been endeavoring to maintain his reputation ever since, has now pressed the town fire hydrants to his aid and has armed himself with a long hose. Should the driver of the car give the policeman the "laugh" when called upon to pull up and pay "toll" to the town of Leicester, he turns the hose on the car and its occupants. According to the view of a prominent Boston lawyer, "it would look as if the town wanted to collect a good deal of money in fines and was afraid the speeders would get away into another town, which would reap the harvest." As soon as some of the individuals who happen to be treated to a douche of cold water bring actions of assault against the perpetrator of this "new method" he will find it cheaper to revert to old ways.

Iowa Finds a New Bugaboo.

Iowa farmers have a new cause of complaint against the automobile, but it is now directed merely against a class and not against the car generally. White automobiles are now the bete noir of the rural agriculturist of that Western State, because they assert that a horse that will pay not the slightest heed to any other kind of car will immediately begin to do "circus stunts" on the approach of the light colored machine. The farmers in certain sections of that State are agreed that black machines scare horses least, but it does not appear that a petition has been circulated asking owners to confine themselves to that color.

Scorchers Misuse "Ambulance Sign."

Those who belong to the healing profession in Chicago, and are at the same time owners of automobiles, have been quick to take advantage of the fact by affixing a red cross sign prominently to their cars, which means immunity from arrest for overspeeding, regardless of the errand on which they happen to be bent at the time, for the policeman has unbounded respect for the "doc." But others have been quick to take advantage of the protection offered by the same magic sign, and have affixed it to their cars, whether physicians or not. Knowledge of this has come to the "force," and it will go hard with the first one caught speeding under cover of an "ambulance sign."

This Farmer's Rage Was Costly.

There is one sadder but wiser man in Caledonia, Wis., to-day. He is Ernest Kell, the motorphobic farmer who brutally assaulted Samuel Hansen, chauffeur for Dr. C. Q. Shoop, of Racine, simply because he imagined "them pesky machines were getting to be a nuisance to farmers hereabouts." Kell was arrested and fined $25 and costs by a local justice, and later made the defendant in a $1,000 damage suit brought by the injured man. Realizing the error of his ways Kell effected a compromise out of court by paying $100 in cash in addition to all the costs. The assault Kell committed was one of the most cowardly and uncalled for that has been brought before the attention of the authorities. The farmer gets out of his scrape pretty luckily, as he would probably have fared much worse had the case come up as per schedule in the November court. The medicine served to Kell has had a remarkable effect upon men and boys who heretofore have been a terror to motorists, as there has not been any trouble since Kell's arrest and punishment.

Two Claimants Sue for Reward.

As an interesting sequel to the somewhat startling case of the Pittsburg chauffeur who ruthlessly ran down a small boy some time since and for whose arrest and subsequent conviction a joint reward was offered comes the story of a series of legal proceedings against the Pittsburg Automobile Club to recover the amount of the reward. Theodore M. Jones, of No. 32 North Fifth street, and Mrs. Sadie Thome each have entered suit for the $250 reward offered by J. K. Mitchell, the employer of Myers, the convicted driver, and the sum of $100 offered by the club. Jones insists that he gave the information which led to the arrest and conviction, while Mrs. Thome, with whom Myers lived at No. 112 North Seventeenth street, make a similar claim. John J. Keefe, of No. 2,225 Van Pelt street, is also a claimant for the pot, and is likely to enter a third suit against the much besuited club.

Winning Over the Gamins.

Chicago has undertaken a campaign of education, with the stone and mud slinging gamin of the streets as the pupil. At present the propaganda is confined to one of the Windy City's citizens, Charles A. Coey, who has been devoting at least one day a week to giving a treat to as many street Arabs from the tenement districts as the tonneau of his Thomas car will hold. To each outing has been added a lecturette to the participants on the evils of stone throwing at cars, from which Chicago has been suffering lately, and a promise of immunity has been exacted from each recipient of a ride.

PROS AND CONS OF RACING

How the Sport Has Benefitted the Industry—The Florio Cup Contest.

Paris, Sept. 15.—The racing season has terminated with the contest for the Florio Cup over the Brescia Circuit, in Italy. It must be admitted that the season has been a disappointing one, partly through international jealousies, but more especially because we seem to have reached a period when racing can no longer be carried out except at an expense that no club feels itself justified in incurring.

This at least was the feeling before the Florio Cup showed that there was still some hope for the sport in a country where private generosity supplies what is wanting in club funds. So far as France is concerned, the increasingly huge expense of organizing races is making such contests impossible, and the club has been happy to see this financial spectre rise up at a time when it was trying to find an excuse for suppressing races. Great Britain found that the honor of organizing a Bennett race in Ireland was too costly to be repeated, and Germany was crippled for some time by the necessity of making up a heavy deficit for the Taunus race. One of the leading members of the German club said that they would have been bankrupted if they had been required to promote another such event. When, therefore, France would no longer pay the piper, and left other countries to do what they liked with the Bennett Cup, both Britain and Germany said "Nay" to a proposition to organize a race next year, and the agitation in favor of continuing the great classic event suddenly fizzled out. What is more, it was discovered that racing, after all, was no longer needed, and that, having learned all they could from speed contests, manufacturers could not afford to pay heavily for what had merely become a trade advertisement.

All these changes of opinion show that the public are still very much in the dark as to the conditions under which the motor industry is carried on. They have always been arguing on the principle that racing is a sport, whereas it is nothing of the kind, and can never be a sport so long as it is left entirely in the hands of manufacturers. In the old days, when private owners bought high powered cars and drove them in races, we had sport in the best sense of the word. The racing machines were often built to order; or, if makers ran cars themselves, they were always sure of the vehicles, if victorious, finding buyers at fancy prices. Racing cost nothing, and often brought the makers considerable profit, as well as honor and celebrity to the private gentlemen who drove the cars.

The increasing speed of the cars and the necessity of a costly organization changed all this. With entrance fees raised to $2,500, there is no hope for the private owner, and none but rich firms who think they have a good chance will care to stake so much on the hazard of a race. For it is a hazard when so much depends upon such a fragile material as the pneumatic tire, and when the element of luck enters so much into a race, how can it be said to prove the comparative merits of a car? No one can say that the best car wins, for cars equally good or even better may be put out of the race by tire punctures, and makers who have a reputation to uphold hardly like to risk everything upon such a precarious accessory as the pneumatic tire.

If the luck of racing is regarded unfavorably by the manufacturer, it is by no means inconsistent with the sport; and if racing were carried on for the fun of the thing, the incidents would merely add that element of uncertainty that gives so much zest to the struggle between amateur competitors. The sport would offer plenty of interest if it could be pursued on such lines as to bring in private owners, for if they were not stopped by the prohibitive entrance fees there are many sportsmen who would buy high powered cars and run them in races. This would be an excellent thing for the maker, who would find a demand for experimental cars that he is at present unable to get rid of, because they are far too powerful for ordinary use. Others besides Heath, Burton and W. K. Vanderbilt, Jr., would run cars in races if the expenses did not make too great an inroad on their pockets.

That motor car racing is still capable of being carried on as a sport is seen in the success of the Brescia contest for the Florio Cup. This was entirely due to the generosity of a wealthy Genoese gentleman, Chevalier Florio, who is at the head of one of the Italian steamship companies; and as his sole object was to develop the sport in Italy, there were no restrictions placed by heavy entrance fees and other means upon the number and character of the contestants. Professional drivers thus competed with private owners, and the competitors formed the most interesting and varied lot brought together for a long while past. Another thing that contributed to the success of the race was the fact of its being held in a part of the country where a triangular circuit of 103.76 miles was mapped out without touching any towns or villages, the corners of the triangles being formed by the towns of Brescia, Cremona and Mantua. The circuit had to be covered three times to bring up the distance to 311.3 miles. The route is perfectly flat, except a few miles from the start, where there are some undulating stretches, but there are several sharp bends, though none of them of a particularly dangerous character. It was at first intended to run the race without compulsory stoppages, but if the great plain on which the Brescia circuit is mapped out is specially suitable for racing it suffers, like all the Italian roads, from the thick, impenetrable dust. Something was done to alleviate this trouble, though it could not be got rid of altogether, and the organizers had to establish two neutralizations, or spacing controls as they are called, to prevent the cars from overlapping each other. The method adopted is to trace two lines across the road about twelve yards apart, between which each car has to stop, and is sent off again when the vehicle preceding it is far enough ahead. Thus the stopping times may vary with each car, and this collection of times is one of the most annoying things in calculating the positions. Besides, it seriously minimizes the interest of the race.

According to the arrangements the spacing times should have been telegraphed or telephoned to the timekeeper's shed immediately the cars had passed, whereby it would have been possible to put up the net racing times on the board. In this way the public would have been able to see exactly the positions of the cars as they passed the stands. But these arrangements, however carefully they may be made, never seem to work out satisfactorily in practise. They failed in the Auvergne, and they failed again at Brescia, where the timekeeper did not get the complete spacing times until five hours after the race had terminated. Under these circumstances it is easy to see how the race can lose its interest. After seeing the cars travel the first round there is nothing particularly exhilarating in watching the vehicles flash past the stands one after the other without being able to get the faintest idea as to whether one is gaining on the other. It seemed to be anybody's race. This bewildering uncertainty told sadly upon the patience of the foreign visitors, who found that with the lack of interest and the tropical heat the race was becoming terribly monotonous, but if the foreigners retired in search of cooling drinks, and left the race to look after itself, the Italians kept themselves in a high state of enthusiasm as they cheered the passing drivers.

There is no people more strongly attracted to motor racing than the Italians, and what is more, their sense of patriotism was stimulated by the belief that the Italian cars were having things all their own way. At first Hemery on his Darracq and Rougier on his De Dietrich aroused the hopes of the French visitors, but it soon became evident that some of the Italian cars were traveling faster, Ceirano on his Itala going remarkably strong and covering the first 300 kilometres at an average of a shade over 70 miles an hour, thereby winning the Italian cup. Soon afterwards Ceirano punctured a tire and ran for a considerable distance on the rim, when the wheel broke. Notwithstanding the high speeds at which the cars were driven there were no serious accidents, the only sensational incident being the overturning of the Mercedes of Mariaux, but the driver righted the car again, which was not in the least damaged, and continued the race.

This freedom from accident shows that on a suitable course there is little danger in racing, even when some of the cars are piloted by amateurs. All the Mercedes, for instance, were driven by their owners. Of the twenty-one cars starting only twelve finished, all the others being put out by tire punctures. It was not until late in the afternoon that the results could be declared, when it was found

Digitized by Google

that Raggio had won on his Itala, his time for the 311.3 miles being 4 h. 46 m. 47 s. Raggio is a wealthy gentleman from Genoa who took part in the race as an amateur, and until he had possession of his racing machine he had never driven anything speedier than a 24 hp. touring car. His victory was sensational, for until the results were declared late in the afternoon no one had suspected that he was anywhere near the first, and if Raggio secured the victory for Italy the Italian triumph was still more complete by the fact that all the three trophies offered were carried off by the Itala cars. They secured the Florio Cup and the Italian Cup, as well as the Salemi Cup for regularity.

The following are the results: 1, Raggio (Itala), 4:46:47; 2, Duray (De Dietrich), 4:56:20; 3, Lancia (Fiat), 4:57:04; 4, Hemery (Darracq), 4:48:12; 5, Rougier (De Dietrich), 5:12:50; 6, Nazzaro (Fiat), 5:12:52; 7, Fabry (Itala), 5:18:10; 8, Wagner (Darracq), 5:19:02; 9, Florio (Mercedes), 5:29:11; 10, Gabriel (De Dietrich), 5:33:44; 11, Terry (Mercedes), 6:21:45.

This success of the Itala, following upon the admirable running of the Fiats in the Auvergne, has enormously raised the prestige of the Italian industry which, having been created more recently than in other countries, has already taken its position in the first rank. The manufacture of cars is not new in Italy, for it has been carried on for many years past, but the beginnings of the industry were so unsatisfactory that nearly all the firms dropped out or went into liquidation or were amalgamated, the only survivor being the F. I. A. T. of Turin, which is now one of the most flourishing motor manufacturing concerns in the world. The success of the F. I. A. T. is encouraging other capitalists to go into the industry, with the result that several new marks have lately been created, and how promising they are is shown by the sensational triumph of the Itala. All these vehicles run something upon the same lines. Taking first of all the Mercedes as a model they have been refined and modified until they have developed into an essentially national type of car, in which it must be admitted that not the least interesting feature is the excellent workmanship and finish. The Italians are good at this kind of work, and there is no doubt that the industry will develop rapidly in the early future.

As Italy has made her reputation on racing so she seems determined to carry it on in spite of the partial suppression of long distance speed contests in other countries. The Florio Cup race is to be run upon a much more ambitious scale next year, with prizes of something like $30,000, and it is hoped that the decline of racing elsewhere will have the effect of diverting the attention of makers to the Italian meetings. There is also to be a meeting in Sicily, the home of Chevalier Florio, for which big prizes will be offered, and altogether it seems as if Italy will be making considerable efforts to develop the industry and public interest in the motor car during the next few years.

HONORS WERE DIVIDED

Oldfield and Cedrino "Star" at Rhode Island Racemeet—Barney Wins a "Championship"

Nearly 15,000 people—in fact, the largest crowd that has attended an automobile race meet this season—gathered last Saturday afternoon at the Narragansett Park track, Providence, to witness the deferred race meet of the Rhode Island Automobile Club. Weather conditions were ideal, and the huge grandstands were filled to overflowing, late comers being obliged to stand. The parking spaces along the guard rail were thickly fringed with automobiles and spectators, while all along the fence enclosing the track a dense mass of happy humanity had congregated. The track was in fine shape, hard and with very little surface dust, and good time was made in all the events. The best time of the afternoon was made by Oldfield, who covered five laps in 4:41 1-5. George G. Reed, driving a 40-horsepower Stearns, also showed to advantage in the touring class. He went the five miles in 5:53 2-5, defeating E. C. Bald, in the Columbia.

The first event was a five-mile invitation affair, for three Stanley steam cars, driven, respectively, by F. F. Ladd, W. W. Little and William R. Files. The car operated by Files drew a lead in the first lap, and came steaming across the tape far ahead. Time, 9:13 2-5. Ladd was second.

E. C. Bald, driving a Columbia, could not get away from the tape quick enough in the stock car event for machines listing at from $1,000 to $1,800, and H. A. Capron, in an air-cooled car, showed the Columbia man the way to the tape. Bald also fared poorly in the event for cars selling at less than $5,000. There were only two starters—Bald in a 40-horsepower Columbia and George G. Reed, who drove a Stearns car of the same power. In this event occurred the only hitch during the afternoon. On the programme it was worded: "Five miles; stock cars, catalogue equipment, selling $5,000 or under." Joseph Crowell and L. F. N. Baldwin had entered two Stanley steam cars, and as they had not been notified that these cars were ineligible naturally breasted the tape for the start. Bald and Reed refused to start if the steam cars were allowed to go, so the judges scratched the event. Later Bald and Reed drove the race, the latter winning out handily in 5:53 2-5. His time for each mile was 1:15, 1:08 2-5, 1:08 4-5, 1:10 3-5 and 1:10 3-5.

Naturally the most interest centred on Barney Oldfield, in the Peerless, and Emanuel Cedrino, the F. I. A. T. driver, who, for some inexplicable reason, has been dubbed the "Terrible Dago." Cedrino is a very docile individual, so the pseudonym seems malapropos. In the first heat of a five-mile free-for-all Oldfield and H. D. Church, the latter in a stripped stock Peerless, were the starters. The redoubtable Barney was worsted in this heat. The judges declared it a tie, but, as the cars came under the wire Oldfield was a bonnet behind. Time, 6:09. Cedrino, in the Junior Fiat, easily captured the second heat, leading William Hilliard, 90-horse power Napier, across the tape by over 50 yards. Time, 5:09. Oldfield's refusal to start in the final heat was a keen disappointment to the spectators, and they gave vent to their feelings in an impressive manner. At the finish Cedrino was three-eighths of a mile ahead of Hilliard, with Church trailing the Napier car by seven-eighths of a mile. The time was 5:02 2-5.

After this Oldfield went against his own record of 4:29 for five miles, but was unable to make any impression upon it. He made an excellent showing, though, doing the distance in 4:41 1-5

The so-called "five-mile national championship" was the most exciting event in the programme, although there were only two starters—Oldfield and Cedrino. The latter secured the lead and pole at the gun and was not headed until the two-mile post. Then Oldfield went past the little Italian car with a roar, and the erstwhile "Terrible Doga" had to eat dust the rest of the distance. At the finish the Peerless driver led by one-fourth mile. Time, 4:47. The other events were more or less interesting, and each received the applause it deserved. The summaries:

Five miles, for Stanley steam cars—Wm. R. Files, first; F. F. Ladd, second. Time by miles, 2:03 1-5, 1:48 2-5, 1:55 1-5, 1:48, 1:38; total, 9:12 .-5.

Five miles, for stock cars listing at $1,000 to $1,800—H. A. Capron, 12-horsepower Franklin, first; E. C. Bald, Columbia, second; E. Danes, 12-horsepower Franklin, third. Time, 7:45 2-5.

Five miles, for stock cars selling for $5,000 or less—Geo. G. Reed, 40-horsepower Stearns, first; E. C. Bald, 40-horsepower Columbia, second. Time, 5:53 2-5.

Five miles, free-for-all—First heat—Barney Oldfield, 60-horsepower Peerless, and H. D. Church, 24-horsepower Peerless, tie. Time, 6:09. Second—Emmanuel Cedrino, 24-horsepower F. I. A. T., first; William Hilliard, 90-horsepower Napier, second. Time, 5:09. Final heat—E. Cedrino, 24-horsepower F. I. A. T., first; William Hilliard, 90-horsepower Napier, second; H. D. Church, 24-horsepower Peerless, third. Time, 5:02 3-5, 5:28.

Five miles, against time, by Barney Oldfield, 60-horsepower Peerless—Time of miles, 0:56, 0:56 2-5, 0:56, 0:56 1-5, 0:56 3-5. Total, 4:41 1-5.

Five miles, "national championship"—Barney Oldfield, 60-horsepower Peerless, first; Emanuel Cedrino, 24-horsepower F. I. A. T., second. Times, 4:47, 5:01 3-5.

Special match race, five miles, for $500 purse—Edw. Shay, 60-horsepower F. I. A. T., first; R. N. Judd, 60-horsepower Mercedes, second. Times, 6:11 3-5, 6:45 4-5.

Five miles, for stock cars listed at $1,800 to $2,800—C. D. Snow, 24-horsepower Stevens-Duryea, first; Clifford Edwards, 20-horsepower Ford, second; D. O. Black, 15-horsepower White, third. Times, 7:19 4-5, 8:51.

PACKARD'S 1906 MODEL

Specifications of the Improved Car—New Features Include Increased Size and Power.

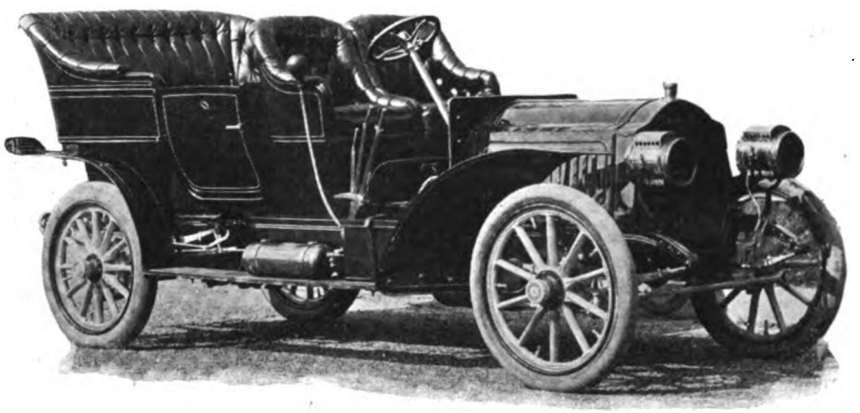
While retaining all of its distinctive "Packard" lines that have made the cars of that company readily recognizable wherever seen, the 1906 model will embody numerous new features, chief among which will be a considerable increase in size and power. It will officially be known as the "Packard 24," and will have a much longer wheel base, as well as 35 to 40 per cent more power than the Model N—in fact, a much larger and stronger car throughout.

The cylinder castings, in pairs with integral water jackets and valve chambers, are imported from France in the rough. Their dimensions are 4½-inch bore by 5½-inch stroke, the pistons having four rings. These figures represent an increase of 20 per cent in piston area over the Model N, and fully double that in increased power, as already referred to, though the additional weight entailed is said not to exceed 5 per cent over that of last year's smaller engine. Instead of being all on one side, the valves have been separated, the intake being placed on the right and the exhaust on the left hand side of the cylinder. While this permits of increased size, it also necessitates the use of two cam shafts, which are enclosed in the crank case to insure lubrication. The size of the flywheel has been increased in proportion, as has also that of the crank shaft, which is of nickel steel.

The substitution of Hess-Bright ball bearings in place of the usual cone forms in the transmission, with a slight lengthening of the latter to provide additional gear face, marks the only change is this essential.

Probably the greatest departure to be found in the new model is that of the adoption of the Eisemann high tension magneto for ignition, although the Packard builders have been studying this system and considering the advisability of adopting it ever since its introduction in this country. The generator is bolted to the front arm of the motor support, and is operated by chain from a sprocket on a small countershaft geared to the left cam shaft. The current is carried through the usual single high tension, vibratorless coil on the dash to the commutator. Both as a reserve and for the purpose of starting from the seat the accumulators are retained, a single vibrator coil being housed in the same case with the magneto coil. One switch located in the coil box gives either the magneto or battery or neutral. Individual switches connecting with the plug stems are further provided in order to facilitate the location of faults.

Slightly increased size distinguishes the carburetter of the new model, though the regular Packard design has been adhered to with the exception of the addition of a new poppet auxiliary air valve, this supplementing the regular air control by lever on the dash.



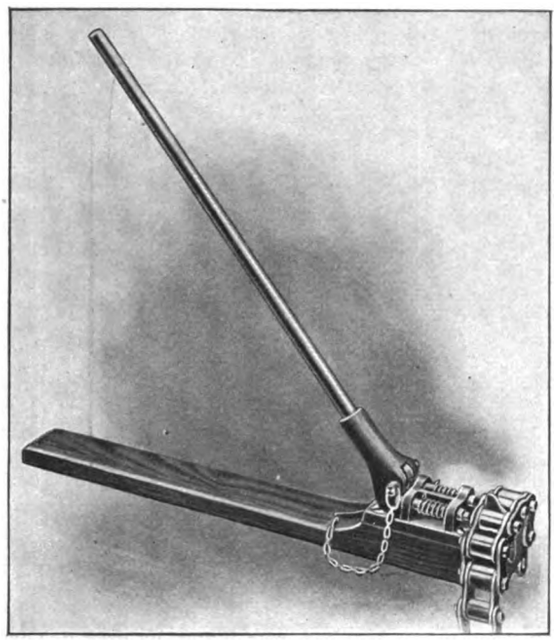
The counterweight form of governor has been discarded in favor of a water governor operated by the pump—a form that has been used more or less by other makers, with considerable satisfaction. The pump being geared direct to the cam shaft, its speed is always in definite relation to that of the motor, and any change is immediately communicated to the diaphragm of the governor, which automatically adjusts the throttle. A departure has also been made in the crank case, the upper half of which is cast with a solid web between the arms, affording complete protection and constituting an improvement over the usual sheet metal pans. A change has likewise been made in the suspension, which now consists of four semi-elliptic springs, instead of the former three-point suspension, with a single transverse spring forward. The front springs are now 40 inches long and the rear 56 inches, both being 2 inches wide and having six leaves.

The lines of the body remain practically the same, the long wheel base permitting of a very roomy tonneau. A locker with an upholstered cover placed against the rear of the front seats, and a brass foot rail for the rear-seat passengers that may be folded out of the way when not wanted represent conveniences that will be appreciated.

A summary of the remaining features of the car, which either do not differ from last year's model or so slightly as not to call for special mention, is as follows: Transmission, three speeds forward—10, 25 and 40 miles an hour—and reverse. Shaft drive, direct on high speed, with Packard universal joint; transmission and differential housed in single unit casing on rear axle. Splash lubrication, crank case divided laterally to secure constant level; supply by force feed through single plunger pump, and two sight feeds on dash. Leather faced cone clutch of Packard type, operated by foot pedal and interconnected with emergency brake, locking it in disengaged position when brakes are on. Cooling by tubular radiator and fan driven by wide, flat belt; supply by gear driven rotary pump. Thirty-four inch artillery wheels with cast steel hubs, twelve spokes front, fourteen rear, shod with 4-inch tires on front and 4½ on rear. Pressed steel frame of channel section, 4¾ inches deep by five-sixteenths of an inch thick, reinforced by cross members of same material. Length over all, 151 inches by 28 inches wide forward and 33½ inches wide in the rear. Front axle, cold drawn steel tubing, dropped at center; rear axle, same material, carried on double and triple ball bearings. Brakes, four in number, internal expanding, operated by foot pedal and external clamping on each rear wheel by hand lever. Gasolene tank under front seat, capacity 20 gallons. Oil cups on steering knuckles and steering cross tube joints; grease cups on rear axle.

PACKARD 24, FRONT VIEW.

PACKARD 24, SIDE VIEW.



Name Denotes Speed Capacity.

"Legalimit" is to be the expressive cognomen of a car shortly to be placed on that market by a London firm. Its name is further intended to be significant of its capabilities, for it is to be designed not to exceed the legal limit, but to be capable of an average speed of twenty miles up hill or down without changing gear.

Whitney's Chain Repair Outfit.

Repairing a chain on the road is not only a dirty job, but a more or less difficult one even for those skilled in the use of tools, but, due to the Whitney Mfg. Co., Hartford, Conn., it is to be made a much easier operation. All of the Whitney detachable chains contain one connecting link fitting loosely on the rivets and readily removable by hand without any trouble. This link is distinguished from the others by having notches in its top surface. All of the other detachable links on these chains are, however, purposely forced tightly onto the rivets, and as the latter are made very hard, the ends will sometimes crack through the cotter pin hole when their removal is undertaken with the aid of a hammer or a wrench.

CHAIN REPAIR OUTFIT, READY TO USE.

FOLDED TO CARRY.

In order to obviate this as well as to eliminate other difficulties in removing links, the Whitney company will place the new repair outfit pictured in the accompanying illustrations on the market shortly after October 1. One of the cuts shows the device ready for operation, and the other, with the handle detached so that it occupies but a small amount of space in the tool box. With the aid of this the links may be removed with ease and without danger of damaging any of the parts. It will be made for all sizes of Whitney detachable roller chains.

How a Hood Was Confiscated.

"Any automobile driver who is shy the hood of his White touring car may have same by applying to the marshal of Euclid (Ohio)." Thus runs the tenor of an advertisement issued from the executive headquarters of that little suburb of Cleveland. The announcement does not say that upon presenting himself the owner will promptly be fined twice as much as it would cost him for a new hood, but that particular owner will be able to read between the lines, and there is little doubt but what that particular hood will remain the property of the peaceful hamlet until the next auction sale of unclaimed effects is held.

The marshal of Euclid is conducting the anti-speed crusade usual in such villages, and, other methods failing, he has adopted one familiar to the small boy on Halloween. This is nothing more than a rope stretched across the highway, with the marshal in the bushes at one end of it. Up the road about two hundred yards is a trusty assistant with a red flag and a gun. The assistant waves his flag at every one of the visiting cars to slow down, and every one of them pays not the slightest attention, so runs the story. He then fires the gun and his chief does the stop watch trick, making rapid mental mathematical calculations meanwhile, for the accuracy of which policemen are noted. The answer is always the same; he wins and stretches the rope taut, all this in the interval of time that it takes a speeding car to cover two hundred yards of road. And the victims all stopped when they saw the rope, until the owner of a White was willing to back his car against it, and opened up, with the result that the ring to which it was made fast was forcibly pulled from the telegraph pole, and the car went by so fast that the marshal could not even see its number. But the car lost its hood in the operation, hence the ad.

Where Travel is a Delight.

Many men of many minds are all agreed upon one point: The service of The Lake Shore Railway is as near perfection as it is possible for brains and money to produce. Safety, comfort and speed are the keynotes of the road, and safety, comfort and speed have been attained to a degree never before reached in all the history of railroading. Wise travelers know this to be so and take particular care that their tickets read "Via the Lake Shore."

Combines Volt and Ammeter.

"Two meters in one" is the chief characteristic of the new battery testing instrument placed on the market by the Connecticut Telephone & Electric Co., of Meriden, Conn. It is a combined volt and ammeter, designed for testing the voltage of accumulators or the amount of current in dry cells, and accordingly has a double scale and three connections. The scales are graduated from zero to 6 volts, and zero to 24 or 30 amperes. It is also made in a single reading style for dry batteries only, and is graduated to 30 amperes. Both are carefully calibrated, and the needle supports are arranged for delicate and accurate readings.

An exclusive feature of the instruments made by this company is a ground connection to the case by means of which a cell may be tested without the necessity of using the flexible cord. To do this the metal case is pressed against one terminal and the pointer for volts or amperes, as desired, against the other. The instruments are guaranteed to be accurate, durable and free from mechanical defects, and are sold at prices that should add to their popularity.

"TWO METERS IN ONE."

Montclair Plans Passenger Service.

An automobile passenger service is planned for Montclair, N. J., according to an application made at the meeting of the council last Monday sight. An exclusive license will be asked to operate the line over the streets not now occupied by trolley lines for a period of fifty years, subject to cancellations of charges at any time after the first ten years have expired, on a majority vote of the people. The petitioners are said to be responsible business men of New York and Montclair, and include Daniel B. Ely, director of the Interstate Securities Co., of New York, and C. H. Silliman, a retired banker. In the petition it is stated that the maximum rate of fare will be two cents per mile, and the minimum charge will be five cents. The service will consist of a coach each way over the route adopted every fifteen minutes from 7 a. m. to 9 p. m.; every half hour from 9 p. m. to 11 p. m., and every hour from 11 p. m. to 1 a. m. The license is to be revoked unless service is inaugurated within six months from the date it is granted.

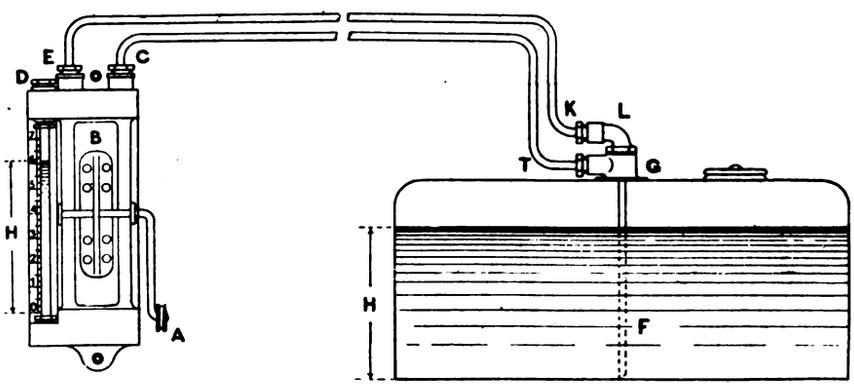
FUEL GAUGE ON THE DASH

New Device Which Shows the Contents of the Gasolene Tank at a Glance.

Despite the hundred and one different devices in the form of gauges for determining the amount of fuel in the tank of a car, none of them appears to be more than an approach to what represents the height of convenience in this respect. In none of them, so far as known, is it possible to know how much there may be remaining in the tank without leaving the car.

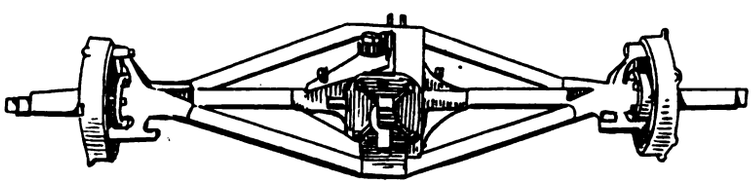


Where the tank happens to be under a seat, a location no longer usual in up to date models, and when it is at the rear and under the end of the tonneau with only the filler

FUEL GAUGE, FIG. 1.

nozzle protruding, practically the same thing applies. What has been wanted all along is a means of immediately ascertaining the exact amount of fuel in the tank without leaving the wheel and it has apparently remained for an Irishman to provide the means for doing this, while on the other hand he apparently had to apply to a Teuton to make it for him, as it is termed the Murphy gauge and is made by Schaeffer & Budenberg, London.

The indicating portion of the gauge is secured to the dashboard within easy reach and plain sight of the chauffeur. The registration is not constant, but when it is desired to learn the depth of fuel in the tank it is only necessary to raise a small lever and depress it again, when a column of liquid will rise in the gauge glass to a height equivalent to that in the tank. Regardless of how many times this operation is repeated the indication shown will always represent the amount in the tank. An idea of the mechanism used in the gauge, as well as the manner of operating it, may be had from the accompanying illustrations. In Figure 1, showing the gauge itself, will be noted the detail of the latter. As a preliminary, kerosene is poured in at D until it becomes level with the zero mark on the gauge glass. When it is desired to register the height of water in a tank water is used in place of kerosene. This is done before the gauge is connected up. A special connection G is necessary on the tank itself, this holding a pipe dipping close to the bottom, as shown at F.



FUEL GAUGE, FIG. 2.

This communicates with the opening E in the instrument itself, and when this connection is complete the gauge is ready for use. The level of the tank in relation to the gauge, nor the fact that it is open to atmospheric pressure, has no effect on the operation of the gauge, but the tubing and connections must be tight, as any leakage would cause inaccurate readings. Further, the tank may be under additional pressure, as is the case in many instances on modern cars, in which case the gauge will still operate as accurately as where this does not exist, but an extra line ending at C must be provided, in order that the pressure in the tank and in the gauge may be equalized.

The action of the instrument is as follows: When the lever A is slowly raised and lowered the bellows B is compressed by the crank P, raising the pressure in the system. As this pressure rises the gasolene is driven down the pipe dipping into the tank F until it reaches the bottom, when no further increase is obtained. It will readily be apparent that the pressure thus induced in the system and required to force the liquid down the pipe F to the bottom is exactly equivalent to the head indicated by H. However, since the line tube and the bottom of the gauge glass M are under exactly the same pressure, by reason of the hole R in the chamber holding N, produced by the bellows B, it must also raise the level of the liquid in the gauge glass to a height corresponding to H. Kerosene being slightly heavier than gasolene will show a discrepancy by recording a fraction less than the actual amount, but the difference is so small as not to be discerned in practise. Where the tank is under pressure the second line is required in order to transmit this to the gauge glass, and since there is an equivalent pressure below it by reason of the connection of the other tube with N its effect is neutralized.

New Axle for Cardan Drive.

When first advocated, the problem of cardan shaft drive was somewhat complicated by the necessity of supporting a large fraction of the weight at the same points as the drive. The usual tubular construction so generally adopted for this purpose has, however, proven how well founded were the ideas of its first proponents, and it is safe to say that few, if any, of the many evil results prophesied by the adherents of the chain drive for all weights have been materialized in the last two years' practice where the axle has been properly built. Since its introduction there have been scarcely any changes of moment to record in the design of this part of the car, so that the departure of a foreign built car in this respect is of interest.

REAR AXLE WITH CARDAN DRIVE.

This is the Diamant car, which, apart from its rear axle, does not embody any unusual features. The construction of the latter as well as its radical divergence from the type common in practice will be noticeable at a glance from the illustration. The driving shaft is not surrounded or encased by a hollow axle, as is customary, but is supported by a trusslike construction carrying the weight of the body and relieving the live axle of this strain. The differential gear case is entirely supported by the tubular construction, to which it is made fast top and bottom, both of these tubes ending in a universal or cardan joint supported by the brake drums.

How to Preserve Rubber Goods.

Many of the peculiarities of rubber have not been recognized by those whose business includes the handling of a greater or less quantity of tires, inner tubes and the like, despite the fact that a large number of the dealers and garage keepers in the business are graduates of bicycle days. Only too few appear to realize that it is above all a material that is subject to more or less rapid and serious deterioration unless properly handled.

Frequent complaints are made by garage keepers and car owners that tubes and tires which they have had but a comparatively short time have begun to show signs of surface cracks. Usually the claim is that the rubber has "perished" where the complainant stoops to gramatical form, or has become "dead" where he does not regard the formalities. But more often the complainant is quite indignant and descends to the vernacular to the extent of telling the manufacturer that the tires he sent out were "rotten."

One of the commonest sights in the "automobile row" of any large city, is the stack or festoon of tires that adorns the windows of the supply shops. In such a position they get the full benefit of the direct rays of the sun. No rubber of whatever quality will stand continued exposure to the light and particularly to the baking effect of direct sunlight, but there are men who have been in the trade for years who have never learned this simple fact.

Where the garage is concerned it is nothing unusual to see tires allowed to come in contact with gasolene and oil, than which few things are better calculated to destroy the value of the rubber. It is certainly to the interest of the dealer to see that his stock of tires is not displayed in the store window, nor hung up under the glass roof of the garage. A high temperature and exposure to light are alike detrimental to the rubber and nothing but proper storage will suffice to preserve it in the best condition, either for sale or for use.

THE CELEBRATED BRAMPTON CHAINS

Made from Self-Hardening Steel.

THINK IT OVER

Morris & Wilmarth,
Stock Grain Cotton and Coffee
32 Broadway,
New York, July 22nd 1908

Mr. C. E. Miller,
#96 Reade Str.,
New York.

Dear Sir:-

I wish to write you regarding the Brampton chains which I purchased for my Franklin car.

No. 1 I have used all the time and have given it about as hard a pull as it is possible for a chain to receive. All over the mountains of Orange County, New York, and between New York, Philadelphia and Lakewood until I am tired of the road.

The long chain on the Franklin is a pretty stiff proposition and many, in fact, most of my friends state that their first trouble on that car is that chain breaks and I have met people who have worked for hours to get their chain fixed on the re'r, but I have never met a Brampton in trouble and mine so far has not a scratch on it.

No. 2 is in the paper in which your salesman wrapped it for me, and is resting in the bottom of the car waiting for No. 1 to break.

My partner, Mr. Wilmarth, President of the L. I. Automobile Club, has a Brampton on his Winton and has had practically the same result as myself. He got me in line for the Brampton and there I stay.

Very truly yours,

Dict.
H. S. M. - G.

The Week's Patents.

799,368. Electrical Sparking Ignition system for Gas Engines and Starting Switches Therefor. Vincent G. Apple, Dayton, Ohio. Filed November 9, 1903. Serial No. 180,464.

Claim—1. In combination with an engine igniter, a dynamo arranged to operate consistently with the engine, a battery, a magnetically responsive switch member adapted to complete a circuit connecting the igniter with either the dynamo or the battery, an electro-magnet included in a constantly closed circuit with the dynamo arranged when energized to attract the switch member to close the circuit connecting the dynamo and igniter, and suitable circuit connections for the parts specified.

799,374. Rubber Fabric. Christian H. Gray, Silverton, and Thomas Sloper, Devizes, England; said Sloper assignor to said Gray. Filed October 5, 1903. Serial No. 175,881.

Claim—1. A new article of manufacture, consisting in a tire fabric composed of approximately parallel cords crossing the tread from the edge of the tire and so arranged that the longer circumferential outline at the tread formed by the curve is completely filled by the cords which lie substantially as close together at that line as they do at the smaller circumferential outline at the edges of the cover, substantially as set forth.

799,388. Transmitting Mechanism. Frederick S. Keyes, Warren, Mass. Filed March 29, 1905. Serial No. 252,680.

Claim—1. The combination with a driving member and a driven member, of a plurality of circularly arranged springs for transmitting power between the members, each of said springs comprising a plurality of independent sections.

799,393. Circuit Breaker for Explosive Engines. Ralph M. Lovejoy, Meredith, N. H. Filed January 30, 1905. Serial No. 243,268.

Claim—1. In a device of the character described, the combination of a contact lever studded with contact points, some of which are insulated from said lever and others in electrical communication therewith, a part engaging with and disengaging from said contact points, and electrical connections for said lever and said part.

799,459. Speed Regulator for Explosion Engines. Georg Duffing, Mülheim-on-the-Rhine, Germany. Filed June 1, 1903. Serial No. 159,700.

Claim—1. In a gas engine, the combination, with means for varying the mean speed of the engine, of means for maintaining a substantially uniform velocity of inflow of the explosive gases to the cylinder under different mean speeds.

799,471. Shaft Sleeve for Roller Bearings. John Kincaid, Vancouver, Canada. Filed December 4, 1903. Renewed August 10, 1905. Serial No. 273,676.

Claim—1. An axially divided sleeve for roller bearings, provided with a series of V-shaped external grooves adapted to receive reversely cone shaped rollers, lugs carried on each end of the divided sleeve and projecting parallel to and in the same direction as the shaft, said lugs adapted to grip the shaft, and bolts passing through the said lugs to hold them in their shaft gripping position for the purposes specified.

799,537. Explosive Engine. William E. Collier, Muskegon, Mich., assignor to Racine Boat Mfg Co., Muskegon, Mich., a corporation of Michigan. Filed September 16, 1904. Serial No. 224,686.

Claim—1. In an explosive engine, the combination with the crank shaft of the engine, the inlet valve mechanism for the explosive mixture and the ignition mechanism, of a sleeve slidable on the said crank shaft, a lever pivoted to the engine frame for sliding said sleeve and operative connections between said sliding sleeve and the valve and ignition mechanisms, constructed to operate in unison said mechanisms to control the supply of explosive admixtures to the engine cylinder, and to regulate the sparking period of the ignition device relative to the stroke of the piston.

799,551. Anti-Skidding Device for Vehicles and Cycles. Henry S. Eyre, St. Leonards-on-Sea, England. Filed February 23, 1904. Serial No. 194,940.

Claim—1. An anti-skidding device for application to the wheels of vehicles and cycles, consisting of flexible members mounted upon the wheel laterally of the tire and in proximity thereto and protruding beyond the tire of the wheel to such an extent as to be capable of passing completely under the tread or outer peripheral surface of the tire, substantially as described.

799,638. Resilient Tire for Road Wheels. Alfred Ducasble, Neuilly, France. Filed September 8, 1904. Serial No. 223,757.

Claim—1. A tire for the wheels of road vehicles, consisting of a rubber body part having separate chambers formed therein and continuously open air ducts leading from said chambers directly to the atmosphere, substantially as described.

799,662. Covering for Automobile Tires. Benjamin Nathan, New York, N. Y. Filed December 20, 1904. Serial No. 237,598.

Claim—1. A cover adapted, when closed about a tire, to form an annular tube, the opening to receive the tire being from the front and all exposed edges of the cover in its closed or tubular form being overlapped in the same general direction, to shed rain when the cover and its inclosed tire are hung up.

799,690. Vehicle Brake. Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass., assignors to Sturtevant Mill Company, Portland, Me., a corporation of Maine. Filed January 10, 1905. Serial No. 240,424.

Claim—1. The combination with a stationary casing and a driven part or shaft, of a

multiple disk brake comprising a series of disks or rings, a portion of which are connected with said driven part or shaft, to rotate therewith, and a portion of which are engaged with said casing so as to be restrained from rotation, combined with a pressure cylinder attached to said casing, and a piston in said cylinder for forcing the said disks or rings into fractional contact with each other when a braking force is to be applied.

799,691. Vehicle Brake. Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass., assignors to Sturtevant Mill Company, Portland, Me., a corporation of Maine. Filed April 24, 1905. Serial No. 257,102.

Claim—1. The combination with a stationary part or casing and a driven part or shaft, of a multiple disk brake, comprising disks or rings, a portion of which are connected with said stationary part or casing, so as to be restrained from rotation, and a portion of which rotate with said shaft, a pressure cylinder, a piston therein, and levers interposed between said piston and said disks.

799,703. Steering Mechanism for Automobiles. Charles O. Barnes, Oswego, N. Y., assignor to Marcia I. Barnes, Oswego, N. Y. Filed June 8, 1905. Serial No. 264,278.

Claim—1. In a steering gear for automobiles the combination with a steering post and a screw therein, of a two part nut engaging the screw, a pitman and adjustable means connecting the pitman and both sections of the nut.

799,720. Electromagnetic Clutch. Henry H. Cutler, Milwaukee, Wis., assignor to the Arnold Magnetic Clutch Company, Milwaukee, Wis., a corporation of Wisconsin. Filed September 22, 1902. Serial No. 124,354.

Claim—1. A clutch having a magnet member and an armature member, of means for reversing the current through the coil or coils of said magnet member when it is desired to de-energize the same, means for resiliently pressing said armature member away from said magnet member, whereby the armature is freed from the magnet when the latter is de-energized, substantially as described.

799,778. Equalizing Gear for Vehicles. Otto Cullman, Chicago, Ill. Filed June 27, 1904. Serial No. 214,425.

Claim—1. In an equalizing gear the combination of a two part casing, such parts provided, respectively, with annular recesses on the inner faces thereof, and one of such parts provided with an external annular flange on the edge thereof adjacent to the other part., with an annular rabbet on such flange, a sprocket rim fitting the rabbet, bolts extending through one part of the casing and through the annular flange on the other part, bolts extending through the sprocket rim and through the annular flange, axle gear wheels respectively journaled in the parts of the casing, and pinions journaled in the annular recesses to intermesh with the axle gear wheels, substantially as described.

799,780. Self-Propelled Vehicle. Joseph Le Conte Davis, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York. Filed April 9, 1904. Serial No. 202,413.

Claim—1. In a power transmission mechanism, a driving member, a differential gear having its central member connected thereto, a driven member connected to one outer member of said gear, a dynamo electric machine connected to and adapted to assist in driving the driven member, and a second dynamo electric machine connected to the other member of said gear.

799,791. Vaporizer for Hydrocarbon Engines. Frank I. Hitchcock, Bridgeport, Conn. Filed August 21, 1903. Serial No. 170,256.

Claim—1. The combination in a vaporizer having a body portion, a caporizing chamber, an air inlet port and a fluid supply valve, of a weighted valve for said port, an adjustable stop set to limit the upward movement of the valve to represent a full open port at high speed, a piston plunger operating between the air chamber and the vaporizing chamber to actuate the fluid supply valve, an adjustable stop to limit the upward movement of the plunger, for the purpose set forth.

799,805. Power Transmission Mechanism. Charles G. Simonds, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York. Filed April 8, 1904. Serial No. 202,144.

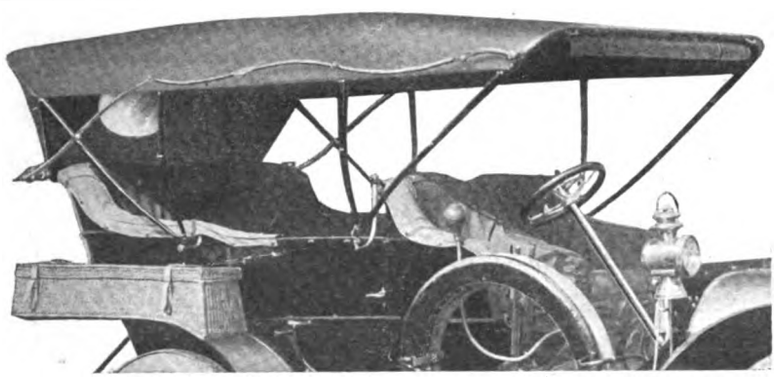
Claim—1. In a power transmission device, a driving member, a driven member, a series of rotatable members, two rigidly connected gears rotatably mounted on each of said rotatable members, a series of pinions engaging said gears and connecting said rotatable members to each other and to the driving and driven members, and means for holding an yor all of said rotatable members stationary and for locking any of them to a pinion.

799,856. Internal Combustion Turbo-Motor. Charles Lemale, Paris, France. Filed October 21, 1904. Serial No. 229,381.

Claim—1. A combined atomizer and igniter forming a lighting candle and designed especially for the feeding and igniting of continuous combustion turbo-motors, comprising a tubular device adapted to be introduced into the air tube and to receive combustible liquid at its outer end and to discharge the same at its inner end in atomized form into the surrounding air channel, and having at its extreme inner end an exposed wire adapted to be maintained incandescent so as to ignite continuously the combustible mixture formed in the space around the tubular device.

799,859. Vehicle Tire. Frank A. Magowan, Trenton, N. J. Filed June 6, 1905. Serial No. 264,002.

Claim—1. A tire comprising a flexible tube filled with a mass of hollow soft rubber bullets, each containing gas in a state of high compression, whereby each bullet is distended to such an extent that it conforms throughout to the adjoining bullets or wall of the tube, the gas in each bullet being capable of expanding the bullet far beyond its normal capacity when the bullet is released from confinement.



799,946. Power Transmitting Mechanism. Fitzroy M. Slocum, Erie, Penn., assignor of one-half to Harry V. Ashby, Erie, Penn. Filed December 27, 1904. Serial No. 238,399.

Claim—1. In a power transmitting mechanism, the combination of oppositely faced gears C C; the pinion D mounted between them and in mesh therewith; the rock lever G mounted concentrically with the gears C C and between said gears; the dogs H pivotally mounted on the rock lever between said gears, said dogs extending outwardly from their pivots and adapted to engage said gears alternately at points more remote from the axes of the gear than the axes of the dog pivots; springs for forcing said dogs into engagement; and means for reversing the position of the dogs to reverse the direction of movement of the gears.

800,046. Speed Indicator. Nathaniel Young, Newmarket, N. H. Filed January 28, 1905. Serial No. 243,070.

Claim—1. In a speed indicator, a rotary shaft, a fixed sleeve, a second sleeve slidable thereon, a stud provided on the fixed sleeve, a barrel housed in the latter and connected for movement with the slidable sleeve, said barrel having a spiral groove engaged by the stud for rotating the barrel during longitudinal movement of the same, governor weights connected with the slidable sleeve and shaft and operable by the latter for moving the sleeve and barrel, a pointed operatively engaged with and movable by the barrel, and a dial over which the pointer moves.

800,112. Tire for Vehicle Wheels. Joshua

BRISCOE MFG CO.

OLDEST AND LARGEST

MAKERS OF

AUTOMOBILE RADIATORS

During the past season we sold 12,945 radiators to 54 bona fide motor car manufacturers, among whom are nearly all of those who have produced high grade and successful cars.

Over 30,000 of our radiators are now cooling automobile engines.

Our standard honeycomb radiators are of true cellular construction, allowing cross circulation, which accounts for their high cooling efficiency per pound of weight of cooler.

The hit of the year 1905 in radiator design has been our flat tube construction, with gang fins.

We make special designs for every class of car, from the light runabout to the heaviest truck or omnibus.

The finish on Briscoe fenders is unexcelled. 1906 styles on metal dashes, hoods and runabout boxes are prepared, and we are daily booking contracts for next season's business.

COOLERS FENDERS

HOODS EASTERN FACTORY, NEWARK, N. J. TANKS

By dealing with us you get the benefit of our long experience and the protection of the many patents we own covering our *methods of construction.*

The Pierce Great Arrow car, which won the Glidden trophy, was equipped with a Briscoe radiator.

Of the 12 American water cooled gasoline cars which received first certificates at the end of the tour 5 of the radiators were made in our shops, 4 were made by the car builders and only 3 were made by other radiator manufacturers. These facts are typical of our prestige.

Our two large plants are ready to take care of our rapidly increasing business. We can not only promise, but make deliveries.

Write to our nearest office for estimates and get in line for 1906.

BRISCOE MFG CO.

DETROIT, MICH., AND NEWARK, N. J.

W. Jones, Harrisburg, Penn. Filed December 30, 1904. Serial No. 238,948.

Claim—1. A vehicle tire embodying a tread surface formed of metal strip or wire extending around the tire, with projections thereon, the projections on adjacent sections being out of line longitudinally of the tire; substantially as described.

800,118. Control of Automobiles. Hermann Lemp, Lynn, Mass., assignor to General Electric Company, a corporation of New York. Original application filed January 14, 1904. Serial No. 188,958. Divided and this application filed January 13, 1905. Serial No. 240,870.

Claim—1. The method of stopping a self-propelled vehicle deriving its motive power from an electric generator driven by a prime mover, which consists in reducing the speed of the prime mover below the critical speed of the generator without stopping the prime mover.

800,128. Grid or Element for Secondary Batteries. William Gardiner, Chicago, Ill., assignor, by mesne assignments, to Universal Electric Storage Battery Company, a corporation of Delaware. Filed August 22, 1904. Serial No. 221,644.

Claim—1. An electrode for accumulators comprising a thin sheet of relatively pure lead provided with a plurality of closely arranged apertures extending therethrough, said sheet being folded transversely thereof into a plurality of folds, the walls of which are curved oppositely, forming single pockets, and the adjacent edges thereof being forced into close contact and integrally connected at a plurality of points intermediate the lateral edges of the sheet.

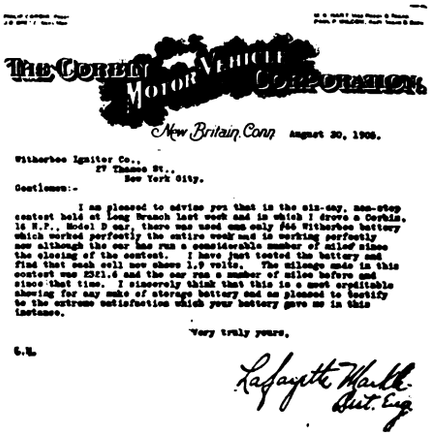
OFTEN ATTEMPTED

it remained for the

Witherbee Battery

to

SOLVE THE IGNITION PROBLEM.



Not our claims but

TESTS

and

TESTIMONY

such as this prove how thorough is the solution:

The Corbin Motor Vehicle Corporation.

New Britain, Conn. August 30, 1905.

Witherbee Ignitor Co.,
27 Thames St.,
New York City.

Gentlemen:-

I am pleased to advise you that in the six-day, non-stop contest held at Long Branch last week and in which I drove a Corbin, 16 H.P., Model D car, there was used one only 6v6 Witherbee battery which worked perfectly the entire week and is working perfectly now although the car has run a considerable number of miles since the closing of the contest. I have just tested the battery and find that each cell now shows 1.9 volts. The mileage made in this contest was 1321.6 and the car run a number of miles before and since that time. I sincerely think that this is a most creditable showing for any make of storage battery and am pleased to testify to the extreme satisfaction which your battery gave me in this instance.

Very truly yours,

G.H.

No More Borrowing Cars Without Owner's Permission

PATENT APPLIED FOR.

The Hill Lock Valve (here shown), is a new device and a good one. It is connected at any convenient place in the gasolene pipe and when locked and the key withdrawn prevents the gasolene from flowing to the carburettor and consequently the engine cannot be started. The key cannot be taken from the lock until the gasolene supply is entirely shut off—when shut off keep the key in your pocket. Impossible for anyone to steal your car. Your fuel supply is **locked,** but your car can be pushed to the wash-stand for cleaning, or into the street in case of fire. It is a small device made entirely of brass and turned with a "special key"—no two keys are alike. The lock is of the finest grade, it has five tumblers and cannot be picked or opened without the "right" key. Three keys are furnished with each lock. The locks are perfectly tight, being tested by gasolene under a pressure of one hundred pounds. It is made for all sizes of pipe from the smallest motor-cycle or launch to the most powerful touring car. Price, $5.00. **Special price to Supply Houses and Automobile Manufacturers.** Apply to your supplyman or garage. If not found in stock, address

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

¶ The strongest argument that was ever put up for a good tire has been put into Morgan & Wright tires, namely, the material they are made of and the way they are made.

¶ It is easy to say that a thing is better than good, or "the best thing that ever happened along this line," but we are content to put the emphasis in the tires rather than on the claims for them.

☞ And users of the tires are mighty well satisfied with this method of procedure.

¶ Morgan & Wright tires are known the world over as tires that give a big backing to a modest claim.

Satisfaction and the OLDSMOBILE

Have you ever talked with an Oldsmobile owner? If so, you must have been impressed with the satisfaction he expressed with his machine. Users of Oldsmobiles are our best advertisers. You naturally grow to like a machine that gives you satisfactory service, and you are glad to tell your friends about it.

At one time and another we have had a good deal to say about the Oldsmobile for doctors' use. Here's what one doctor says:

"My runabout has attracted considerable attention. It always goes and I am never delayed except occasionally on account of tires. I live on the top of a high hill, and cannot go anywhere without going up and down some long steep hills. I am out in all kinds of weather. My car is practically as good as the day I bought it and it has had hard usage. The expense of keeping it in order has been very small."

We have hundreds of letters along the same line and names and other information will gladly be sent on request. If you are interested in a machine for business or family use write us for further information. By calling on our nearest agent, you can easily arrange for a demonstration, which is the most convincing argument we can present.

Send for Catalogue 53.

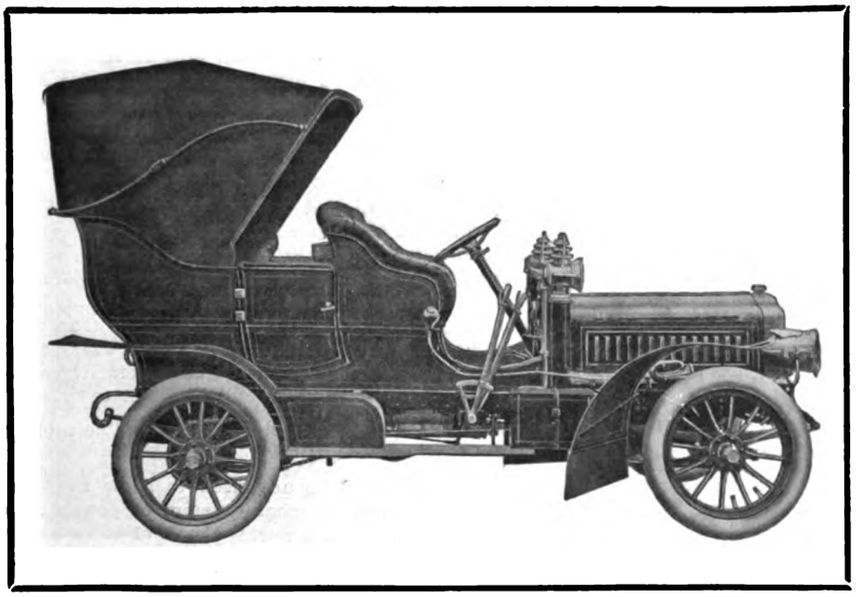
DON'T EXPERIMENT
Just Sell
THE FORD

Mr. Agent:—Over 2,000 Automobile buyers decided during the past season not to experiment. They all bought "Fords." It is even more important for the retailer to *sell* a car of known merit than it is for the purchaser to *buy* one. The buyer only loses his *money*, but the agent who sells a car not up to standard loses both *prestige* and *reputation*.

The success of the Ford Motor Co. is built on the success of the Ford Cars, and you know how great our success has been. Remember that people like to do business with successful firms, and a *car with a reputation is easier to sell than an unknown*.



You know the general rush to the Ford exhibit at the shows, and how they all ask, *"What has Ford this year?"* plainly indicating that automobile men look to Henry Ford for new ideas and originality of design.

We have a surprise or two up our sleeve this year—particulars about October 15th—nothing before, except that there is certainly good business ahead for the Ford agent in 1906, and it might be well to write us and see if we can give you the proposition and the territory you require.

TANNER & COMPANY,

AUTOMOBILES, MOTOR CYCLES, BICYCLES AND SEWING MACHINES.

NEW BEDFORD, MASS., September 2, 1905.

E. R. THOMAS MOTOR CO.,
Buffalo, N. Y.

Gentlemen:—Last October I purchased a 24 horse power Thomas Flyer from a Boston owner, who told me that it had been driven 10,000 miles during 1904. Since owning this car I have covered 21,000 miles in it personally, getting over $1700.00 from renting the same, and the machine seems smoother running to-day than ever.

I have carried six and seven people in it many times on trips forty and fifty miles. Better service could not be asked or given.

Yours very truly,
WM. E. TANNER.

COMMONWEALTH OF MASS.
New Bedford.
Bristol, ss.

{ L. S. }

Personally appeared the said Wm. E. Tanner and made oath that the above statement is true. Sworn to before me this second day of September, 1905.

CHARLES T. HERON,
Justice of the Peace.

E. R. THOMAS MOTOR COMPANY,

Makers of Thomas "Flyer" Automobile.

The NEW Type XII, 35-40

POPE

PRICE $3,500

Some advance and interesting data on the LATEST and GREATEST achievement of the WORLD'S LARGEST AUTOMOBILE PLANT.

MORE POWER, MORE SPEED, MORE ROOM, MORE STYLE, MORE STRENGTH—LESS WEIGHT.

Every one in the trade **the world over** is now familiar with the unparalleled and unapproached record of the justly renowned **Pope-Toledo.** A few months ago we could not ourselves see that it was possible to produce a better car than that with which we **have won every notable speed, endurance and hill climbing contest.** But our wide experience, new methods, new and improved machinery, large quantities, and **above all the highly successful** culmination of experiments in **specially treated steels** which have been in progress for the past four years, have enabled us to produce in Type XII **a car that is a long step in advance** of our fondest wishes or expectations.

Motor Four Individual, Twin Head, Cylinders, 4-cycle Copper Jacketed, developing **under brake test 43** to 44 H. P. Water Cooled by the matchless Pope-Toledo Radiator. **All gears encased.**

In this space it is impossible for us to go into any deep exposition of the many points to be considered in producing the highest efficiency for the least weight in gas engine design. What has been accomplished in the Pope-Toledo in this respect might be tersely stated in the claim that in this now highly efficient motor **the very remarkable result** has been attained of **SECURING ONE H. P. FOR EVERY TEN AND EIGHT-TENTHS POUNDS OF WEIGHT,** and this, too, **without** in any sense **sacrificing** the **strength** or wearing parts. This proportion of weight to horsepower has not been achieved by any mere laboratory test, by running the engine at an impractical speed, but under the ordinary conditions which prevail.

Ignition Jump Spark, Coils and Batteries. Provision made for Magnetto. Control is simple, flexible and positive. The car can be driven **on high speed behind a team walking** or up to its maximum speed, **simply by the use of throttle and spark,** both located on the Steering Wheel.

Control The **Pope-Toledo** Engine has been developed to such a point of efficiency that we are now able to run it from 200 R. P. M. to 1200 R. P. M., at which point it delivers its greatest efficiency. It is not only exceedingly **quiet under all conditions,** but the use of a scientifically constructed Carburetor gives **great latitude of power** to the engine **at varying speeds.** Heretofore Carburetors have been generally adapted to deliver their greatest efficiency to the engine at a maximum speed. The Pope-Toledo Carburetor is developed to such a point of fineness that it is **self-adjusting** to all conditions of speed, so that **with the Spark and Throttle alone,** and always **on the high gear,** you can drive a Pope-Toledo **anywhere,** taking all ordinary hills without rushing them and without shifting gears.

Transmission Transmission is of the Sliding Gear type, three speeds forward and reverse, being **absolutely direct drive** on the high gear, with **no idle gears** in mesh. Ball bearings at all important points. The Transmission on Type XII **is one of our great forward steps,** mentioned above. The steel we use in this transmission, of **210,000 pounds tensile strength,** will play a most important part in the future development of the Pope-Toledo. True, it is very **expensive to make** and still more **expensive to work.** By its use we are enabled to produce not only the **lightest,** but the **strongest** and **most efficient transmission ever placed in any automobile.** This steel is of the finest quality, more expensive and harder to work than any used by any maker in Europe. While it is true that some of the European makers use some very fine steels, we do not hesitate to say that the steel herein mentioned is **superior from every standpoint,** which **we have proven** to our own satisfaction by **every known test** and by **actual experience** from using it in the cars themselves **under the most severe and arduous road conditions.**

Frame All steel Frame **of few parts,** tested to a safe load away above what is required. All steel, light, flexible and strong, making the car very **easy to ride in,** and **easy on both tires** and **engine.**

Double Direct Outside Chain Drive At this stage of automobile development but few arguments need be advanced to show that on the score of efficiency, which means **reduced friction, weight** and **durability,** the chain system of power transmission, **AS APPLIED TO LARGE AND POWERFUL TOURING CARS,** is a long way ahead of the Cardan Shaft **from every standpoint.** We give herewith a table of exhaustive tests conducted in France in the past year to determine this point.

It has been thoroughly demonstrated, and **engineers are agreed,** that bevel gears are not as **high** in efficiency as Spur Gears, and that Chain Drive shows **greater efficiency, longer life** and **less loss of power** than either Spur or Bevel gear. Recent French experiments on the efficiency of Bevel gears, Spur gears and pitch chains, as applied to motor cars, **prove beyond question** that **the chain drive is decidedly superior.** The results of these experiments are as follows:

	NEW	WORN
Roller Chain, Lubricated and exposed to dust	94%	92%
Bevel Gear, Steel on Steel, Running in Oil Bath	88%	82%
Spur Gear, Steel on Steel, Running in Oil Bath	92%	90%
Spur Gearing, Leather Pinion, Cast Iron Wheel	88%	80%
Spur Gearing, Steel Pinion and Fiber Wheel	88%	80%
Spur Gearing, Steel on Steel, greased and exposed to dust	90%	80%

Digitized by Google

H. P., "Quiet-Mile-a-Minute"

TOLEDO

POPE Toledo AUTOMOBILES

FULLY EQUIPPED.

Chain drive is **decidedly** more **flexible** and **efficient, requires less care,** and on account of its flexibility, the motor and transmission and chassis are **not subjected to violent shock.** The matter of repair and replacement is **infinitesimal** as compared with bevel gears. You can tow a car with a broken chain, but you cannot do so with a broken bevel gear; and the older and more worn the gear the more power it consumes. Isn't it significant that in the elimination trials for the Gordon-Bennett Race, in which out of 70 or 80 cars the best three from each country were to qualify, that, notwithstanding **over 50% of the entries were shaft driven,** out of the entire lot **only one shaft-driven car was able to qualify.** In the race **this car was not able to even make a showing** against all the chain-driven cars.

Brakes The Pope-Toledo system of Brakes is incomparable. Both foot and emergency brake act on the hubs of rear wheels, which are very efficient and easily adjusted to wear.

Gasoline Capacity 17 gallons, sufficient for 270 miles—from ⅓ to ½ more mileage for the same quantity of gasoline **than any car in the world.** Gravity feed to Carburetor.

Axles The Axles on Type XII. are of the I Beam Type, FORGED IN OUR OWN PLANT of the best steel obtainable, being tested to **110,000 pounds tensile strength.**

Wheel Base 104 in.—Standard tread, 54 in.

Wheels 34 x 4, front and rear. We make all of our wheels here in our own plant. **All wheels spoked and assembled by hand.** Ball bearings of large dimensions.

Body Design Entirely new and original, along beautiful lines, distinguished and distinct. Double side entrance. Very large and roomy tonneau, **especially easy of access.**

Front Seat and Tonneau **Of Mirror Finished Steel,** large and comfortable front seat divided. Deep and heavy upholstering.

Hood and Guards Improved Hood, opening from either side. Guards oval shaped, **made of aluminum,** following curve of wheels. Front guards large and flaring.

Tires We shall adopt for regular equipment **the best tire on the market,** determined by observation and our wide range of experience. Rims also of standard sizes, admitting the use of any Foreign or Domestic tire.

Equipment Full set of lamps, horn, tools, floor mats, tire pump and jack. A very complete outfit **of the highest quality.**

Proportion of Horsepower to Weight Not further back than a year ago it was considered good practice to have 100 pounds of car weight to one horsepower. How much has been accomplished, not only **without the sacrifice of strength,** but by **actually increasing strength and durability,** can be best understood by stating that the new model Pope-Toledo has **ONE H. P. FOR EVERY 54 POUNDS OF WEIGHT.** It seems unnecessary to produce any arguments as to what this means. Certain it is that one of the chief points must be in durability not only to tires (which, of course, is a most important factor), but also to **all moving and wearing parts.** Experience and deep study of the entire subject of automobile building have demonstrated that to attempt to make a car strong by merely increasing the size and consequently the weight **of the parts,** not only **does not constitute strength,** but is actually **a source of weakness,** for the larger and heavier car is sure to contain within its weight **the germs of its own destruction.** We have aimed, therefore, to keep **the horsepower up** and **the weight down,** without for a moment losing sight of the importance of strength and safety.

Weight Distribution With the weight more evenly distributed in this new model than ever before, it must become evident to any one posted in the art that a great deal has been accomplished, not only for the **durability of the machine,** but **for the tires** themselves. The even distribution of weight and strength, aside from motor design, has probably received more careful study from us this year than ever before, and has only been possible through the wide knowledge we have gained from the thousands of our cars in use, and from whose performance we have been able to apply the proper result in the increase of power and reduction of weight, with increased durability and strength.

We also build Landaulettes, Limousines, and a Gentleman's Roadster of 20 H. P., four cylinders. **Special cars built to order of 20, 30, 35, 40, 50 and 60 H. P.** Further details given upon request.

20-25 H. P. DOUBLE SIDE ENTRANCE, - - -	$2,800
30-35 H. P. FRONT ENTRANCE, - - - - -	3,200
35-40 H. P. DOUBLE SIDE ENTRANCE, - - -	3,500

AMONG THE LEADERS IN ELIMINATIN' RACE.

Our regular stock model finishes third in Vanderbilt Cup Race trials. Just think what we are offering you this year. It is like this. You sit behind the wheel of a **ROYAL TOURIST** with one hand on the throttle lever. Move the lever an inch or so and you have an ideal vehicle, under perfect control, for city use or country touring. Move the lever a little more and you have a motor car fit to compete with the speed machines especially built for the **VANDERBILT CUP RACE.** Please bear in mind that the famous Royal that did so well in the race last Saturday is the same as the one you buy from us in every particular except, of course, you get a luxurious and handsome body, instead of a couple of tin seats.

The 1905 YALE

Our contention is simple, plain, and easy of demonstration. We maintain that the 16 H.P. YALE at $1,000 and $1,100 and the 24 H.P. at $2,500 will deliver more power than you can secure from any other two cars in America, unless you are willing to spend $500 more.

Fit for a king's pleasure in beauty and luxuriousness with smooth, still engines whose loudest sound is a subdued hum—all we ask is that you submit them to to the most severe and trying tests.

You will, of course, want the catalogue as a preliminary, but we would suggest that you get in touch with our agent at once.

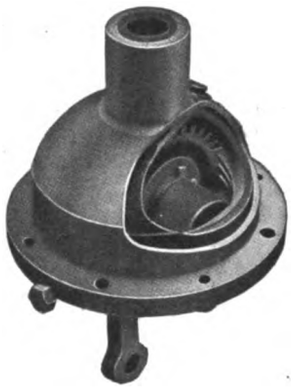
CHAIN DRIVE WINS

VANDERBILT CUP TRIALS

"DIAMOND" Chains were on the winning car in the eliminating trials for the Vanderbilt Cup. The second car to finish was also driven by "DIAMOND" Chains.

Both covered the course in about 22 minutes less time than the third car, which was gear driven.



Judicious selection of materials and accuracy of manufacture account for the successful performance of "DIAMOND" Chains.

TRADE ◇ MARK.

When your old chain is worn out try a "DIAMOND." It fits any standard sprocket.

The Expected Revolution Has Come!

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should ***not*** buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the ***two*** cycle two cylinder Elmore engine.

Understand—the ***two*** cycle two cylinder Elmore engine produces ***two impulses every time the fly-wheel turns.***

As you know, the two cylinder ***four*** cycle furnishes only ***one*** impulse every ***fourth*** time the fly-wheel turns.

In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

New York, July 22nd 1906

Mr. C. E. Miller,
#96 Reade Str.,
New York.

Dear Sir:-

I wish to write you regarding the Brampton chains which I purchased for my Franklin car.

No. 1 I have used all the time and have given it about as hard a pull as it is possible for a chain to receive. All over the mountains of Orange County, New York, and between New York, Philadelphia and Lakewood until I am tired of the road.

The long chain on the Franklin is a pretty stiff proposition and many, in fact, most of my friends state that their first trouble on that car is that chain breaks and I have met people who have worked for hours to get their chain fixed on the road, but I have never met a Brampton in trouble and mine so far has not a scratch on it.

No. 2 is in the paper in which your salesman wrapped it for me, and is resting in the bottom of the car waiting for No. 1 to break.

My partner, Mr. Wilmarth, President of the L. I. Automobile Club, has a Brampton on his Winton and has had practically the same result as myself. He got me in line for the Brampton and there I stay.

Very truly yours,

Dict.

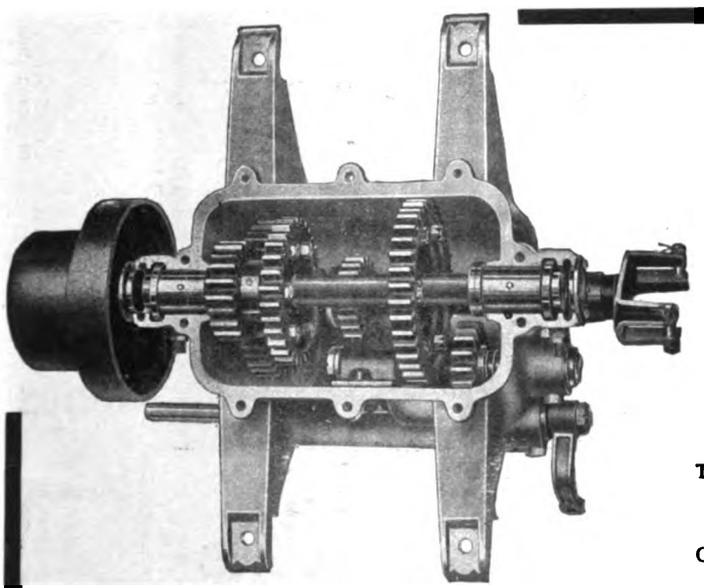
Much of the satisfaction resulting from the use of Timken Roller Bearings is due to the simplicity of construction,—few parts and every part a special feature.

We think this explains why it is easy to sell so many of them and why owners of machines demand them.



A good automobile is no stronger than its weakest part. Can you afford to have anything but Timken bearings?

Positive adjustment. No loose parts. Perfect end thrust and you can take up the wear.

All types front and rear axles, Lemoine or Elliott knuckles, direct and chain drive rear axles, truck axles, wheels, channel rims.

TIMKEN ROLLER BEARING AXLE CO.

Main Office and Works: CANTON, OHIO.

GARFORD TOURING CAR PARTS

The great problem of the hour for the automobile manufacturer is to develop the details of his engine. This study is so absorbing and important that the duty of producing axles and other parts has been left to other specialists.
Our specialty is the manufacture of parts for the very highest class of cars—parts that are as good as life insurance. We make:

REAR AXLE, Independent Shaft Drive, Ball or Plain Bearing, Weight Carried Entirely on Axle Tube
FRONT AXLE, I-Beam Section Nickel Steel Bed, Ball or Plain Bearing
CHANGE GEAR STEERING GEAR CLUTCH
DISTANCE ROD AND BRACKET PROPELLER SHAFT LEVERS FOR EMERGENCY-BRAKE AND CHANGE-GEAR

Parts of one size are suitable for cars weighing up to 2400 lbs. and of 30 H. P.
Parts of the other size are suitable for cars weighing up to 2800 lbs. and of 50 H. P.

Write for Circular No. 12.

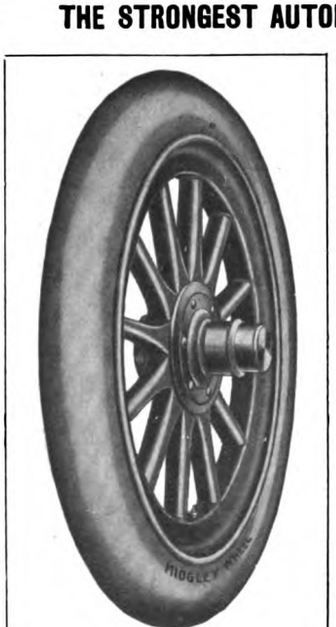
PATENT APPLIED FOR.



The Hill Lock Valve

(here shown), is a new device and a good one. It is connected at any convenient place in the gasolene pipe and when locked and the key withdrawn prevents the gasolene from flowing to the carburettor and consequently the engine cannot be started. The key cannot be taken from the lock until the gasolene supply is entirely shut off—when shut off keep the key in your pocket. Impossible for anyone to steal your car. Your fuel supply is **locked,** but your car can be pushed to the wash-stand for cleaning, or into the street in case of fire. It is a small device made entirely of brass and turned with a "special key"—no two keys are alike. The lock is of the finest grade, it has five tumblers and cannot be picked or opened without the "right" key. Three keys are furnished with each lock. The locks are perfectly tight, being tested by gasolene under a pressure of one hundred pounds. It is made for all sizes of pipe from the smallest motor-cycle or launch to the most powerful touring car. Price, $5.00. **Special price to Supply Houses and Automobile Manufacturers.** Apply to your supplyman or garage. If not found in stock, address

Rambler

$1650

The comfortable Surrey, Type Two, for those who ride at night

The long, wide body, with extra large tonneau, contributes greatly to the ease and enjoyment of the evening drive or theatre party.

The canopy top, with swinging glass front and water-proof side and back curtains that can be rolled down and fastened to the car, affords perfect protection to the occupants in cold or stormy weather.

Any speed desired from three to thirty miles per hour can be made with sufficient power always at command for ascending ordinary grades, with full load, on the high gear.

We are now demonstrating these cars for the benefit of prospective buyers, and practical road tests will be made for those who call at any of our branches.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, October 5, 1905. No 2

POPE'S LINES FOR 1906

Two Strikingly New Cars Included, One of Them Amazing Value for the Price.

The Pope announcement for 1906, which was made this week, uncovered two strikingly new models—a Pope-Hartford with a four-cylinder vertical motor of 28-30 horsepower, listing at $2,500, and a Pope-Tribune with a two-cylinder vertical engine, at $900. Both cars have double side entrance bodies, and the Tribune, one of which is already on exhibition at the New York branch, is by long odds the biggest and most pretentious car that has yet appeared at such a low price.

The Pope-Hartfords of this year, the horizontal single cylinder at $750, and the two cylinder horizontal, at $1,600, will be retained in the line, as also will be the Pope-Tribune single cylinder vertical runabou at $500.

The Pope-Toledo line will include one new model, Type XII, of 35-40 horsepower, at $3,500. It will be lighter, stronger, roomier and more powerful than any of this year's cars. The remainder of the line will be made up as follows: 20-25 horsepower, double side entrance, $2,800; 30-35 horsepower, front entrance, $3,200; 35-40-horsepower, double side entrance, $3,500; 50-60-horsepower, double side entrance, $6,000. The $3,500 car previously was of 30-35-horsepower.

Rambler Branch in 'Frisco.

Hereafter Thomas B. Jeffery & Co. will themselves handle the Pacific Coast. They have discontinued their agency arrangement and are about to establish their own branch in San Francisco, which will have charge of the States of California, Oregon, Washington, Nevada and Arizona. The branch will be in charge of L. H. Bill, of L. H. & B. I. Bill. The firm will be continued as before, and will remain distributors of Kokomo tires, Solar lamps and Veeder odometers.

Supply Concern is in Straits.

William Ewig, the Heil Rail Joint Welding Co., and the Western Malleable and Grey Iron Mfg. Co., all of Milwaukee, Wis., have filed an involuntary petition in bankruptcy against the Western Auto Supply Co., also of Milwaukee. The amount of the claims filed by the petitioners is $559 75. No receiver has been appointed. The Western Auto Supply Co. is located at 285 Virginia street. The petition recites that the company admitted in writing on September 23, 1905, that it was unable to pay its debts.

Royal to Get Selden License.

The Royal Motor Car Co., Cleveland, is about to enter the Selden fold, that is, the Association of Licensed Automobile Manufacturers. All the preliminaries have been arranged, and only signatures and payment of the initiation fee remain to complete the negotiations. It is understood that provision has been made whereby unlicensed dealers who have closed Royal contracts for 1906 will be protected.

Exports Top Two Million Mark.

With the eight months ending with August last export returns have topped the two-million mark, or an increase of fully 100 per cent since 1903. The total for the period in question in the latter year was $1,049,311; for 1904, $1,322,499, and for the present year, $2,041,134. For the month of August alone the difference is not so great, being $168,303, and $260,853 for 1904 and 1905, respectively.

Massachusetts Dealer's Fatal Accident.

W. E. Tanner, of W. E. Tanner & Co., New Bedford, Mass., was killed near Syracuse, N. Y., on Friday night last, while returning from a visit to the Thomas factory. He failed to see a double turn in the road, with the result that his car upset and he was thrown against a big rock and his skull crushed.

White to Open in Philadelphia.

The White Sewing Machine Co. is preparing to establish a branch in Philadelphia, under the management of E. C. Johnson. As he has been for some time connected with the Quaker City Automobile Co., the former agents for the White, Johnson will not be a stranger to his surroundings.

Jess Draper, formerly of Peterson & Draper, Chicago, and one of the best known men in the trade, has become sales manager of the Wayne Automobile Company, Detroit.

RADICAL SHOW REFORMS

A. L. A. M. Eliminates Some Eye Sores and Nuisances—Trade Tickets Also Abolished.

There will be no horn tooting, no souvenirs and no "Price, $1,000" or "Sold to Mr. Pierpont Vanastorbilt" tags at the "Sixth National Automobile Show at Madison Square Garden," which, by the way, is the manner in which the Association of Licensed Automobile Manufacturers designate their show in the first piece of their printed matter that has seen the light.

These rather radical decisions are laid down in the rules and regulations that will govern the exhibition which were issued this week. They are not, however, the only departures from established customs that will prevail. The abolishment of "trade tickets" and coupon admission books, the shortening of the hours of free morning admission to dealers and requiring that they shall first obtain a special card, good for one morning, only, are all in the nature of new moves that are as of prime interest as are those relating to horns and souvenirs.

The language of the altered regulations that have been promulgated is as follows:

"No exhibitor shall assign, sublet or apportion the whole or any part of the space allotted to him, nor exhibit therein any other goods than those of his own manufacture or that he sells in his regular course of business.

"No decorations, furniture or drapery will be permitted in any exhibition space, except such as is provided by the show committee.

"No counters, fixtures or other structure will be permitted in any exhibit unless it shall be sanctioned by the show committee in accordance with the general scheme of decoration and use of space.

"The Garden will be open from 11 a. m. to 11 p. m. to the general public.

"All coverings of exhibits must be removed by 10 o'clock a. m. each day.

"Badges will be provided by the management for each exhibitor and a reasonable number of employes necessary for the proper conduct of the business connected with the exhibit, which will admit them to the Garden

Digitized by Google

building at all times during the week of exhibition. These badges will be furnished on written application to the show committee, giving in detail names and duties of the persons for whom application is made. Each badge will be numbered and registered, and in case of loss a new badge will be issued only on payment of $5.

"In case of transfer of badge, the same will be taken up and considered forfeited.

"The price of admission tickets will be 50 cents each; no trade or other underprice tickets will be sold to any one, nor will any coupon admission books be issued.

"Before 11 a. m. the hall will be open only for exhibitors, employes and dealers. Special cards of admission, however, will be issued to dealers in automobiles, tires and accessories on application for same at the public bureau of information in main lobby (good for one day only) for admission before 11 a. m. only.

"All horns exhibited, whether as the equipment of an automobile or as an accessory, must have the reeds removed therefrom.

"No advertisements, cards or signs of any character, other than those officially provided by the show committee, will be permitted in any exhibit. No 'price' or 'sold' card can be displayed on any automobile or other article exhibited.

"No advertising or printed matter, which, in the opinion of the show committee, is undignified or otherwise objectionable, shall be distributed.

"The distribution of souvenirs of any kind by exhibitors is prohibited."

Big Demand for Tops.

The demand for tops was one of the remarkable developments of the last season which promises to be exceeded only by the call for them for 1906 use. Practically all of the top manufacturers report a rushing state of affairs, the London Auto Supply Co., of Chicago, stating that the early orders for their styles have attained such surprising proportions that it appears not wholly impossible that despite their facilities a "waiting list" may have to be established.

Winton Adopts Hill Oiler.

One of the earliest of the 1906 surprises to be uncovered is the adoption of the Hill precision oiler by the Winton Motor Carriage Co. It is a big feather in the cap of the Steel Ball Co., of Chicago, who market the Hill device, as it signifies that for it the Winton people have discarded and swept aside the results of all of their expensive experiments with lubrication systems, which have extended over a long period of years.

Barnes Moves Up a Peg.

Claire E. Barnes has been elected secretary of the Detroit Steel Products Co., of which he previously was sales manager. He will, however, continue to fill the latter position.

The Week's Incorporations.

Kittery, Me.—Atwood Mfg. Co., under Maine laws, with $40,000 capital; to manufacture lamps. President and treasurer, W. Q. Atwood.

Quincy, Mass.—The Griswold Mfg. Co., under Massachusetts laws, with $25,000 capital; to deal in automobiles. President and treasurer, Robert G. Griswold.

New York City, N. Y.—William Roche Dry Battery Co., under New York laws, with $25,000 capital. Corporators—E. A. Lowe, Conrad Milliken and F. W. Conger.

Two Rivers, Wis.—Wisconsin Automobile Supply Co., under Wisconsin laws, with $5,000 capital. Corporators—A. M. Farrell, Joseph Koenig and W. S. Bremer.

Passaic, N. J.—Greene Motor Car Co., under New Jersey laws, with $100,000 capital; $20,000 paid in. Corporators—Raymond A. Greene, Edward A. Greene and William L. Clark.

Los Angeles, Cal.—The Golden State Motor Car Co., under California laws, with $500,000 capital. Corporators—J. Hauerwaas, C. F. A. Last, J. Singer, R. M. G. Phillips and F. M. Townsend.

St. Joseph, Mo.—St. Joseph Automobile Co., under Missouri laws, with $2,000 capital, all paid in. Corporators—W. P. Fulkerson, E. A. King, E. P. Snowden, B. J. McGuire and F. F. Fulkerson.

Schenectady, N. Y.—American Locomotive Automobile Co., under New York laws, with $300,000 capital; to manufacture automobiles. Corporators—W. A. Parker, G. H. Montague and G. H. Tower.

New York City, N. Y.—Benedict Mfg. Co., under New York laws, with $60,000 capital; to make gasolene engines. Corporators—Paul C. Benedict, Maud E. Benedict and Mary J. Benedict.

Augusta, Me.—Gearless Transmission Co., under Maine laws, with $500,000 capital; to manufacture and deal in automobiles. Corporators and officers—President and treasurer, Q. L. Fairbanks.

Boston, Mass—Mills-Kennedy Co., under Massachusetts laws, with $25,000 capital; to deal in automobiles. Corporators and officers—President, Edward P. Kennedy; treasurer, A. Ernest Mills.

Knoxville, Tenn.—The Scarborough Co., under Tennessee laws, with $20,000 capital; to sell automobiles, supplies, etc. Corporators—W. W. Scarborough, Charles E. Shultz, C. W. Henderson and Cowan Rodgers.

Buffalo, N. Y.—Buffalo Automobile Body & Trimming Co., under New York laws, with $25,000 capital; to make automobile bodies, seats, etc. Corporators—Louis C. Beesing, John A. Heslop and William F. Beesing.

Seattle, Wash.—The Puget Sound Auto Co., under Washington laws, with $50,000 capital. Corporators—T. F. Ryan, George B. Kittenger, William Gottstein, G. H. Bartell, Ferdinand Schmitz, George Z. Dantz, A. W. and W. H. Heinzerling.

New York City, N. Y.—The Hudson Automobile Co., under New York laws, with $5,000 capital; to manufacture and deal in automobiles. Corporators—Ferdinand Schussler, Harold A. Wright, Estelle Schussler and Moses G. Wright.

Oswego, N. Y.—Barnes Gear Co., under New York laws, with $50,000 capital; to manufacture steering gears and appliances for automobiles. Corporators: Charles O. Barnes, Marcia Q. Barnes, Thomas Moore, Charles A. Bentley and Fred. V. Mardock.

Roche Becomes a Corporation.

William Roche, the veteran dry battery manufacturer, has converted his business into a stock company, which was last week incorporated under New York laws as the William Roche Dry Battery Co., capital $25,000. Mr. Roche is the president of the new corporation. C. Laton Ford, formerly first vice-president Celadon Roofing Tile Co., New York, is treasurer; Ernest A. Lowe, president the Lowe Electric Co., is vice-president, and William C. Hubbard, for a number of years with the Westinghouse Electric & Mfg Co., is secretary. The business will be continued at the old address, Nos. 52 and 54 Park Place, New York.

Imports Show Big Increase.

According to the figures of the Appraiser for the Port of New York, 119 automobiles were imported into this country during last month, as compared with only 72 in September, 1904. The total importation for the nine months ended with September was 772 cars, as against 435 during the corresponding period of last year.

Baldwin Experimenting with Motors.

Experiments are now being carried forward with gasolene engines in the oldest home of the steam engine in this country—the Baldwin Locomotive Works. They are being made with the purpose of designing cars for Western railroads similar to those now in use by the Union Pacific.

Tire Covers in All Colors.

The Gilbert Mfg. Co., New Haven, Conn., who were among the very first to market dust, sun and waterproof tire covers, have made a move that will still further enhance the saleability of their product. They are now making the covers in colors to match the finish of practically any car.

To Remove the Springfield Plant.

Columbus (Ohio) capitalists have purchased the title, goodwill and business of the Springfield Automobile Co., Springfield, Ohio, and will move the equipment to the former city. C. C. Bramwell will remain with the company in the capacity of superintendent.

Hathaway gets Lowe's Place.

Josiah Hathaway has succeeded to management of the White Sewing Machine Company's branch in Boston, made vacant by the resignation of the veteran George E. Lowe.

HERE'S A NICE LITTLE LEAGUE

Sells Cars, Repairs Tires, Gives Advice and Does Every Other Old Thing for "25 per."

Quite the roomiest thing that has come to life in New York during recent months recently established its "main office" on Thirty-third street. It styles itself the Auto Protective League—"auto," by the way, signifies "self"—and it is so roomy that if it does one-half of what its printed matter says it will do, or can do, most of the legitimate and illegitimate dealers in America and all of the automobile associations may as well put up their shutters.

Although the league, which holds a New York charter, says "the corporation has established many stations in many parts of the country," only the address of its "main office" is given. This "main office" comprises two rooms in a dwelling house, and the "headquarters staff" at the time of the Motor World man's visit was composed of one man and a boy. Despite the fact, the "league" is well departmentized. Here are some of them:

"Discount department," "garage department," "help department," "legal department," "license department," "transportation department," "insurance department," "touring department," "renting department," "auditing department," "sales department," "novelty department," "tire repair department," "technical department," "foreign department" and "publishing department."

For a modest $25 per year any one may obtain a "certificate" entitling him to the services of any or all of these departments. There was nothing to indicate of which particular departments the man or the boy has charge. But the "technical department," for instance, will "examine cars, free of charge, and give mechanical advice," while the "tire repair department" has "made special arrangements for the repairing of tires by a new and economical vulcanizing system." The "sales department" will "sell and dispose of member's cars without charge," and the "publishing department" will supply any of the automobile papers at cut rates—exactly how it is to be done is not stated. The Motor World, for one, has no arrangement with the "league."

Ambitious as are these plans, they do not tell the whole story of the aims of the "league." The man at the "main office" let fall that "when they have their clubhouse they will probably have a permanent international exhibition of all the prominent makes of accessories."

So far as is ascertainable, the "league" consists of R. E. Jarrige, president, and Stephan Kjeldsen, secretary and treasurer. Mr. Jarrige has figured in the incorporation of several other automobile ventures. Mr. Kjeldsen figured in the newspapers only last week for being arrested twice in the same day for alleged scorching. His "league's" "legal department," which "extends reasonable protection, aid, assistance and advice," was evidently not in full working order at the time, as on the first occasion he was compelled to deposit his watch as bail and for the second alleged offence to leave the car itself as security.

In the Retail World.

J. W. Wilcox has embarked in business at No. 116 East Ninth street, Los Angeles, Cal. He will handle the Maxwell cars.

Frederick Zoll has purchased a half interest in the automobile business of Horner Kelley, Findlay, Ohio, and will take an active part in looking after the affairs of the firm.

The Butler Motor Car Co., of Boston, Mass., has taken the agency for Eastern Massachusetts for the line of commercial vehicles made by the Rapid Motor Vehicle Co. Pontiac, Mich.

The Palace Automobile Garage has opened for business at Seventh avenue and One-hundred-and-twenty-fourth street, New York. The building is of two stores and basement, 50 by 100 feet.

The Big Thunder Mfg. Co., of Belvidere, Ill., who manufacture sewing machine fittings and other specialties, are installing a department for the care and repair of automobiles. They will also carry a line of accessories.

The Frayer-Miller Motor Car Co. is the title of a distributing agency for that car which has just been established in New York in charge of H. H. Knepper; it will take care of the States of New York, New Jersey and Connecticut.

Glens Falls, N. Y., will now have an automobile garage, Miller Bros., the Monumental Square dealers, having decided to build one on the land they have leased at No. 16 Maple street. It will be a fireproof building, one story high, 50x50 feet.

Herbert Austin has purchased the business of L. J. Wyckoff, at 484 Broad street, Newark, N. J., and will open a garage. Associated with him will be Charles Krebs. Both Austin and Krebs have been in the bicycle business a number of years.

The Decauville Automobile Co., New York, which heretofore has devoted itself to imported cars, has found it expedient to take on an American line. Accordingly it has secured the agency for the Franklin in Greater New York, Long Island and Fairfield County, Conn.

The Van Dusin Motor Car Co., of Birmingham, Ala., which has taken over the business of the White-Blakeslee Co., First avenue and Twentieth street, will erect a garage on Fourth avenue, between Twentieth and Twenty-first streets. Its dimensions will be 100x50 feet and its cost $10,000.

George H. Cox, formerly with the Pope Mfg. Co., has "signed" with Thomas B. Jeffery & Co. He will cover the Central West.

WILL SLICE CHICAGO'S "MELON"

N. A. A. M. Votes to Share Profit With Exhibitors and Stifles Endurance Run Rumors.

All those exhibitors at the Chicago show of February next who have exhibited at at least one previous N. A. A. M. show will have returned to them a pro rata share of the net profits of the function.

The Motor World's urging that some such distribution of the "melon" was desirable, in view of the fact that both of the New York shows are to be conducted on the profit sharing plan, and particularly as the National Association of Automobile Manufacturers had no use for its share of the proceeds, bore fruit at the meeting of the executive committee of that organization in New York yesterday. George W. Bennett, of T. B. Jeffery & Co., took the initiative in the matter by introducing the following resolution:

"Be it resolved, That as soon after as possible in the forthcoming Chicago show the association shall rebate to all those exhibitors who hhall have exhibited at a previous show held under the auspices of the N. A. A. M. one-half of the net profits of the association of the February, 1906, show. Such rebates shall be pro rata to the space occupied and the amount paid for it."

The resolution was promptly seconded by Charles Clifton, of George N. Pierce Co., and was carried without opposition. It means that a substantial sum will be returned to the exhibitors. Last year the net profits of the Chicago show approximated $30,000, of which the manager received one-third and the N. A. A. M. the remainder. It is the N. A. A. M.'s share that will be distributed among the exhibitors.

At yesterday's meeting it also was formally decided that there will be no endurance contest this year, which disposes of rumors of an event to occur in November.

The New York School of Automobile Engineers asked for the loan of parts for use in instructing its pupils, but no action was taken on the application.

Mr. Clifton reported that he appeared before the Freight Classification Committee and asked for more favorable rates on automobiles.

Oil on Garage Sidewalk Leads to Law.

The Palace Automobile Station, Hartford, Conn., has been made the defendant in a rather unusual suit. A dressmaker in passing the station slipped and fell, sustaining a fractured knee-pan. She charges that her fall was due to slipperiness of the sidewalk, caused by oil drippings, and believes that $1,000 will be about the proper balm for her wounds.

Garden Ends his Long Exile.

R. D. Garden, than whom few men in the retail world are better known, is coming back to New York. He has resigned the management of the Quaker City Automobile Co., Philadelphia, to become manager of the Harrolds Motor Car Co., which latter concern will hereafter devote itself exclusively to the Pierce line in New York.

The Constructive Principle of Fisk Tires Involves

A Technique So Simple in Manipulation and So Positively Accident-Proof

that it should readily appeal to any discriminating purchaser.

Beads of a wedge shape are applied to a flat rim and held by rings which are rolled on an angle corresponding to that of the bead, so that when drawn down by clamping bolts, the bead acts as an inside cone wedge, with the result that the tire is firmly held to the rim, without air pressure or circumferential contraction.

A Tire so Locked to the Rim Incorporates a "Life Preserving Principle" and Reduces Tire Maintainance to an Economic Basis.

HERE'S ANOTHER HOT ONE

from a Western Dealer who, for obvious reasons, wishes his name withheld.

CADILLAC AUTOMOBILE CO.,
Detroit, Mich.

Gentlemen:--

We have noted with interest your fable on "Tale of Twisted Prices" in the current issue of Motor Age. We were in a position to see the point without the use of a microscope. In fact, we got stung a little ourselves; but that was a trivial matter in our estimation as compared with the effect on some of our good customers. Now, we do not feel that it will be a good thing for us to walk up to the stinger again, and we are seriously considering the advisability of making some other line our leader for 1906, and the particular object we have in writing this letter is to inquire whether you would, under any circumstances, consider a proposition to cut out a certain amount of territory now handled out of ------ and ------ and make a direct contract at this place.

The above dealer is a good one and has sold a large number of cars, has taken good care of his trade, maintained the prices which the maker had fixed for him, but, with what result? Can any honest dealer square himself with his trade when placed in a like position? We doubt it. Cadillac dealers can face everyone of the 3,700 owners of 1905 single cylinder Cadillacs and honestly say:—"The Cadillac prices were right at the beginning, they are right now and will be next year."

CADILLAC AUTOMOBILE CO. - - Detroit, Mich.

Manipulation of the Clutch.

In the handling of a motor car, aside from the function of steering, which at all times is in the hands of the gods, the most sensitive and delicate skill is required in the manipulation of the friction clutch. Whether it be of the common variety of leather faced cone or of the newer type of multiple disk, there is in its use a demand for a nicety of skill and a precision which alone may well be taken as a measure of a driver's ability.

Among the abuses of the friction clutch, the most common is that of engaging it too suddenly, and it is one to which all drivers are liable at one time or another. Its direct effect, supposing that there is no mechanical provision to insure gradual engagement between the working surfaces, is that of striking a heavy blow which penetrates to every portion of the machine, racking it as can nothing else, and straining it as can no other action, not even excepting the effect of running into a stone wall.

When the clutch is let in too quickly one of two things usually happens, either the engine stalls at once and without a whimper, or else something breaks; sometimes very many things break. It may be argued that when under such circumstances any part or parts fail, it is the fault of the designer, since no matter what occurs there cannot originate more than a certain amount of force in the engine, a force which is known to the designer, if not to the public—namely, the maximum power of the engine. But the designer is not of necessity at fault in such a case, since the force is applied so suddenly that it partakes of the nature of an abrupt shock, and hence parts which are amply strong in withstanding a steady pull of the maximum amount may yield to impact.

In the case of touring cars, it usually happens that when the clutch is let in suddenly the motor stalls without doing any injury to itself or to any of the mechanism, but in the case of a racing machine, in which the factor of safety has been effaced from the calculating sheet and all parts are fined down to the limit of essential strength, the effect is quite apt to be more destructive.

When the driver of a powerful car which had been picked to finish well up in the recent eliminating trials on Long Island attempted to start by letting in his clutch too fiercely he was but following an illustrious precedent, and his accident was one the like of which has marred nearly every competition in the history of the sport in which high powered cars have participated. The Renault machine, of which so much had been expected in the Bennett race this year, was similarly put out of the running of the Ardennes Circuit, and numerous other examples of a similar nature have occurred.

Whether in that particular case the driver made an error in judgment in attempting to start too quickly and to accelerate at a rate which was beyond the capacity of the machine, or whether the car itself was structurally weak, matters little; the result remains unchanged. The accident in itself, however, may well be used as a lesson to all drivers, and from it may be drawn a moral worth taking to heart—namely, that the acceleration of a moving body require time, and that the force required to accelerate is in direct proportion to the time, and, conversely, that to attempt to force matters involves the penalty set forth in the oft proven addage, "Haste makes waste."

Roads and the Commercial Vehicle.

Despite the great flow of the good roads enthusiasm and the immense amount of missionary work which is being done at the present time through the press and by actual canvass from house to house, one might almost say, the fact remains that this country is not now equipped with a rightful measure of passable highways, and that it is not likely to become so equipped to any great extent within the space of many years.

The growth of the motor car movement, wholly apart from this fact, though correlated with it basically, comes on apace, and is rapidly assuming gigantic proportions, and the most pertinent question of the day in this connection is, How can the automobile movement continue its progress, particularly in its commercial branch, while hampered as it is by the thousands of miles of poor and mediocre roads over which all traffic except that which is distinctly urban must pass? It is a question that not all of those vitally concerned have put squarely to themselves.

From the standpoint of its present state of development, and taking into consideration the rate at which the motor truck and the motor 'bus are coming into prominence, it is evident that before many years the limit of its applicability will have been reached, unless some system can be developed whereby it will be possible for vehicles carrying heavy loads to get from one town to another without serious loss of time, and without any possible danger of delay on account of mishap due to adverse highway conditions.

By this is meant, not that within a few years, other things being equal, all heavy motor vehicles will have been disposed of in the urban communities which are ever to be so placed, nor that the market will have been clogged within so short a time, but simply that the greater proportion of possible buyers will have been supplied, and that on that account the market will have ceased to increase at its former uncertain rate, and will have settled down into a sort of rut, the bulk of the industry being devoted to the maintenance of existing types of vehicle and to supplying those buyers who are increasing their rolling stock. That is to say, the number of new buyers will in time cease to increase, and will after a further time commence to diminish, without the industry suffering any material loss—a phenomenon which is to-day being exhibited in the touring car market. After that time the increased use of motor vehicles for heavy duty, and for light pleasure duty as well, will be more rational, and will follow directly along the lines of the achievements of those which are already in service.

When that time shall have come, and pending the millennium of good roads, there will be an eddy in the current of progress, unless

Digitized by Google

it be found possible to circumvent the difficulty of getting from centre to centre by machines. At present over the greater portion of the country freight which is to be transported a distance upward of one hundred to one hundred and fifty miles is given over to the tender mercies of the railroads. It is safe to say that never will they be supplanted where greater distances are involved. But when it becomes possible to transport merchandise by motor car in comparatively small amounts, carrying it with dispatch and surety over distances within that limit, and when this haulage can be performed at a cost less than that charged by the railroad corporations, then will the motor car come into its own.

In the mean time practical usage is demonstrating beyond a doubt in every city in the land that the motor vehicle is adapted to all of man's uses for transportation. It is being embraced with increasing enthusiasm by nearly all who have the enterprise to give it a trial, and still it is practically confined to town and suburban uses. What is to be done pending the development of the highway? is the great question, and What is to be the effect of the heavy motor vehicle on the existing roads which are called "good," according to the present standards of judgment? For there be those who say that even the best of roads cannot withstand the tremendous loads which are destined to come with the development of mechanical traction. The assertion in itself is, however, but a sniff at a science which dates back to the time of Cæsar, and is unworthy of consideration. A good road, rightly made, will carry any load which is likely to be put upon wheels, at least until times have changed greatly.

It has been suggested that all roads which are likely to be subjected to heavy traffic of the sort referred to be equipped with steel wheelways of the nature of flat rails with ridges at the sides to prevent the wheels from running off, and that the cost of laying them would soon be returned in benefits derived from the system. Another suggestion is that, instead of steel, cement ways, or rails, be used, the great durability and low cost of the latter material arguing well for its utility in this connection. And in this connection also has come a proposition to construct such roads under regular railway franachises, the term "rail" not being defined by law in such a manner as to preclude the possibility of forcing a right of way over property not willingly ceded for the purpose, and to control and concede the right of use according to a system analogous to that of the toll road.

At the present time a movement is on foot to organize a corporation with this in view, the proposal being to construct a broad roadway with a pair of concrete rails or depressions on either side for the use of heavy vehicles, and to include between them a strip of smooth concrete pavement which shall be for the use of the lighter traffic. According to the scheme, the company owning and controlling the right of way would also own and operate a line of freight and pasesnger vehicles over it, letting out the privilege of use to other parties according to a fixed schedule

Notwithstanding the fact that the toll road pure and simple is a relic of barbarism, and that its existence to-day is a disgrace to those parts where it still is to be found, there is little room for doubt that a roadway constructed for a specific purpose in the manner suggested, wholly apart from the regular highways of the community and exclusive of the ways used for purposes of animal traction, might prove of great advantage to all users of mechanically propelled vehicles, as well as a source of considerable revenue to the promoters. And that it might serve the end of aiding in the development of the commercial motor car, not by way of a finality, but rather as a means of tiding over the period which must elapse before the common highway will be adapted to the needs and uses of all, seems a rational conclusion.

Rules of the Wrong Sort.

Why is it that the automobile enthusiast, the man who has the best interest of the car and its owner as well as its builder at heart, who, on the whole is a most conservative individual brimful of common sense under ordinary circumstances, becomes little short of idiotic when entrusted with the formulating of rules for a contest? It is a query that must remain unanswered, but the fact remains, nevertheless. The latest event to suffer at the hands of such temporary irresponsibles is the Tourists' Trophy, an international event organized in England in token of British deprecation of road racing and primarily for the benefit of the public and the maker. It was expressly stipulated that every entrant should be a touring car pure and simple, but the very precautions taken to prevent the running of racing freaks were productive of what was sought to be guarded against.

The regulation limiting the fuel supply to one gallon for every twenty-five miles was sound, but that limiting the weight proved to be far from it. The fact that the car capable of propelling the greatest weight over that distance on a single gallon of fuel would be making an unusually favorable showing was seemingly never considered. The absurdity of some of the expedients resorted to may be realized from the following excerpts from an account of the start: "Thus there was Frederick Coleman, who had practically ruined two White steam cars to get them down to weight in a competition he could not hope to win, because it was common knowledge that the allowance was insufficient for a steam car. A 1906 model Clement came up to the line with a frame drilled to the semblance of a sieve. The 18 horsepower Siddely, now fitted with racing wheels, shod with tires that put the observer in mind of cycling. Two competitors appeared, each at the wheel of a Thornycroft, with a papier mache bonnet and pedals that had been peeled till they looked like mere pimples. A cardboard covered Dixi," is the description accorded the latter competitor.

Comment upon the idiocy of compelling the entrants to resort to such expedients in a contest held primarily for the purpose of enlisting public confidence in the capabilities of the "stock touring car" the quotations are ours, would be supernuous.

The recent contest for the Herkomer trophy held in Germany affords another instance of the abortiveness of such performances when common sense rules are not adhered to. The prize was to be awarded to the "best touring car," plainly an arbitrary classification extremely difficult to make and apt to differ in the case of each individual owner. In order to comply with this condition it was necessary to award the prize to the most luxuriously fitted car that attained a perfect score in other respects, a result that means about as much to the average man wishing to buy a car as does that of the shorn and cardboard covered entrants in the English affair. American makers may congratulate themselves on having such a common sense event as the Glidden Tour in which to participate.

Evidently the American Automobile Association is "waiting for something to happen" before prohibiting the appearance of women in speed contests. After one of them has been killed or maimed, the resulting public outcry probably will awaken the organization to a sense of duty.

GERMANY DRAWS No. 1

Gets Choice of Starts in Cup Race—Nearly All Contestants Now on the Course—Two of Them Are "Pinched" and Chevrolet Wrecks His Car.

Camille Jenatzy, one of the German team, will be the first driver to have the word "Go!" shrieked into his ear on the morning of the Vanderbilt race. This was decided at the drawing for positions to determine the order of starting in the Vanderbilt Cup race on October 14, which took place at the rooms of the Automobile Club of America, New York City, Monday night, 2d inst. The order will be Germany, France, America and Italy. Naturally, this important detail attracted a large and representative attendance of men interested in the trade and directly and indirectly interested in the race.

The allotment of team places was decided by a double drawing, the representatives having the first honor. Robert Graves, representing the German team, drew first and got No. 1. Next Baron Adrian de Turckheim pulled out No. 2 for the French team; E. R. Hollender, for Italy, drew No. 4, and last A. L. Riker drew No. 3, for America. In the second drawing, by which it was determined in what order the teams should start, Robert Graves again drew No. 1 and De Turckheim secured No. 2, Mr. Riker drew No. 3 and Mr. Hollender the last. It was left to the teams themselves to decide in which order the cars would start, and after some little consultation it was announced that Jenatzy, the only real German on the team, would start first; Duray, for the French team, followed by Dingley for America and then Lancia of the Italians. The full table of the positions in which the cars will be sent off on the morning of the 14th is given below.

At the meeting it was given out that Baron de Caters, who entered a Mercedes as one of the German five, had cabled his withdrawal. S. B. Stevens, of Rome, N. Y., who holds a membership in the German club and owns a 90 horsepower Mercedes, offered to take De Cater's place on the German team, and he was accepted by the commission. Campbell will drive the car.

One of the F. I. A. T. cars entered for the Italian team was put out of the race early Monday morning by Louis Chevrolet, its driver. The accident happened at 7 o'clock in the morning on the road between Lakeville and Hyde Park, about a quarter of a mile south of the Vanderbilt estate at Lake Success. Chevrolet was giving his car an early morning try-out over the course. A heavy mist hung over the road, making it impossible to see any great distance. Chevrolet was going at high speed, and where the road bears to the right failed to keep his car in the road and crashed into a telegraph pole. He was thrown out uninjured, but his mechanician, Henry Schutting, sustained three broken ribs. The 110 horsepower car was completely demolished, necessitating a change in the make-up of the Italian team. Major C. J. S. Miller offered his 90 horsepower F. I. A. T., which Chevrolet used on the track this season, and it also was accepted by the racing board. Chevrolet will drive.

There is still another vacancy to be filled, and it occurs in the German team. Clarence Gray Dinsmore, the American who prefers Paris to New York, arrived in this city this week, and stated that he had not been able to get his Mercedes from the factory, and consequently he had withdrawn from the contest. It is likely that H. L. Bowden's 90 horsepower Mercedes, with Charles Basle at the wheel, will be substituted.

All the foreign "cracks" are now in this country, and most of them are on Long Island training. Hémery and Wagner, the Darracq drivers of the French team, are quartered at Glen Head, having engaged the Glenwood in its entirety. Hollender & Tangeman have leased Pourrier's establishment, including the hotel, garage and outbuildings, for Lancia, Nazzaro, Cedrino, Chevrolet and Sartori, the F. I. A. T. drivers. It is situated midway between Garden City and Hempstead. Heath (Panhard), Szisz (Renault) and Duray (De Dietrich), the other members of the French team, are quartered at Mineola.

Working in conjunction with the Nassau County authorities, Chairman Robert Lee Morrell of the A. A. A. racing board has decided to discipline all the drivers who are caught exceeding the speed limit over the course after working out hours, which are supposed to be before breakfast in the morning. A trap was set on the Mineola straight this week. It is a measured eighth mile, finishing directly in front of the grandstand, and Justice George C. Tatem has been holding court all week. Many tourists who were tempted to "let 'er out" a little on the oiled course were nabbed. Joseph Tracy, the Locomobile driver, was the first of the "cracks" to be nabbed. He fell into the clutches of Patrolman August Seigert, who swore he was going forty miles an hour. Tracy, who was en route to Bridgeport, Conn., was taken to Jamaica and fined $25. Duray, the De Dietrich, driver, was also "pinched," and Baron de Truckheim went his bail at Mineola. The officials expect to reap a harvest before the day of the race.

Much speculation is being indulged in regarding the outcome of the cup race, and just who are the favorites would be difficult to determine. Many think the Italian team will be in front at the finish, some are inclined toward the German and French teams, while others are certain one of the American big trio—White, Lytle or Tracy—will win.

Lancia, the Italian, is a daring driver, inclined to the spectacular and willing to take all kinds of risks, while his team mate and close friend, Nazzaro, is dignified and supercareful, very much like Tracy, the American. Lancia will start fourth, and his headstrong impetuousness may carry him to victory. Jenatzy, of the German Mercedes team, resembles Mephistopheles, and is absolutely without fear. Withal he is careful, and even warns the sparrows from the road while practising on the course. Chevrolet, Cedrino and Sartori, the three F. I. A. T. drivers, are well known to Americans by their performances on the tracks. Chevrolet and Cedrino drive with ease, quite the reverse of Sartori, who is not expected to make a good showing.

Hémery, who is to drive one of the 80 horsepower Darracqs, has been in the racing game several years, his most notable performance being his victory in the classic Ardennes circuit at Belgium in August last. His team mate, Wagner (Darracq), also has a good record. Duray is a blond young man, and looks more Gallic than Saxon. He finished sixth in the international cup race, second in the Florio, third in the French trials and seventh in the Ardennes circuit. Szisz, the Renault crack, handles his car perfectly. George Heath, the remaining member of France's picked team, is best known as the winner of last year's Vanderbilt contest. He is an American by birth, but has taken up residence in France. A 120 horsepower Panhard is his car.

Besides Jenatzy, on the German team are Campbell, Werden, Keene and Basle, the lat-

THE ORDER OF STARTING.

Start.	Driver.	Car.	H. P.	Team.
1.	Camille Jenatzy	Mercedes	120	Germany
2.	G. Duray	De Dietrich	120	France
3.	Bert Dingley	Pope-Toledo	60	America
4.	Vincenzo Lancia	F. I. A. T.	110	Italy
5.	John B. Werden	Mercedes	120	Germany
6.	Louis Wagner	Darracq	80	France
7.	Joseph Tracy	Locomobile	90	America
8.	Felice Nazzarro	F. I. A. T.	110	Italy
9.	A. L. Campbell	Mercedes	90	Germany
10.	Francois Szisz	Renault	100	France
11.	Walter Christie	Christie	60	America
12.	Emanuel Cedrino	F. I. A. T.	110	Italy
13.	Foxhall Keene	Mercedes	120	Germany
14.	George Heath	Panhard	120	France
15.	Herbert H. Lytle	Pope-Toledo	70	America
16.	Louis Chevrolet	F. I. A. T.	90	Italy
17.	—— (To be named)	——	——	Germany
18.	M. Hémery	Darracq	80	France
19.	Walter White	White	40	America
20.	Paul Sartori	F. I. A. T.	90	Italy

CHERVOLET'S WRECKED CAR AND SCENE OF THE WRECK

ter, however, not having been decided upon as yet. Campbell is scarcely known, although he has participated in a few track races. He is an American, and will drive S. B. Stevens's Mercedes. Foxhall Keene, the well known turfman, is naturally superstitious, and wants the racing board to change his number, 13. Werden has some reputation abroad as a driver.

Since the racing board exercised its prerogative and substituted the White, Pope-Toledo and Christie cars in place of the Thomas, Haynes and Royal, the American team is receiving strong support. Bert Dingley (60 horsepower Pope-Toledo), who won the elimination trial, will start third. Joseph Tracy, in the 90 horsepower Locomobile, will be the second of the American team to start, and will be sent off seventh. Naturally Tracy has a large following. It is expected that Lytle's experience in the elimination trial, when he put his car out of the running by changing gear too quickly, will be a lesson to him in the big race. The big Pope-Toledo ought to be well up at the finish. Notwithstanding its misfortune in the trials, the 40 horsepower White is gaining backers every day. Walter White goes over the course every morning, and prefers not to take changes before the race and is driving very carefully. At that he is covering the 28.2 mile circuit in something like 32 minutes. As the unlimited speed capabilities of "Whistling Billy's" sister car are well known, she may well be counted as a potent factor. The White will be next to the last car to start, but it is a long and good chase from the rear. Instead of Robertson, Walter Christie will handle the Christie car.

The cars will be started from Mineola as near 6 o'clock as possible, Saturday morning, 14th inst., at intervals of one minute.

New Jersey Clubs Get Together.

New Jersey automobilists have followed the example set successively by New York, Massachusetts and Illinois, and is the fourth State in the Union to form a State Automobile Association, organization having been perfected last week. The object of the new State association, which will be known as the Associated Automobile Clubs of New Jersey, as embodied in the constitution, set forth a desire to conduct a social and protective organization of all persons in New Jersey interested in motor pleasure vehicles; to unite against unjust and unreasonable legislation, and to maintain the rights and privileges of automobilists generally. Frederick R. Pratt, of the New Jersey Automobile and Motor Club, of Newark, was elected president, but no other officers were elected until all the clubs in the organization can be canvassed. Eight clubs, with a membership of about 1,200, are included in the organization as follows: New Jersey Automobile and Motor Club, Newark; Automobile Club of New Jersey, East Orange; Hudson County Automobile Club, Jersey City; North Jersey Automobile Club, Paterson; Monmouth County Automobile Club, Ashbury Park; Mercer County Automobile Club, Trenton; Cape May Automobile Club, Cape May, and Atlantic City Automobile Club, Atlantic City.

Squire Klem Catches Willie at Last.

William McNichol and the touring car belonging to his father, James P. McNichol, of Philadelphia, are in trouble at Magnolia, N. J., thanks to an all summer campaign of 'Squire C. F. Klem, of that burg, who has been keeping tabs on Willie and the car for many weeks. Willie has the high gear habit, and though Squire Klem could not get him every time he oversped the limit, he kept faithful count, with the result that when at length the lad did fall into his clutches he owed the town just $250. When arrested on October 1 William was in a hurry to make an engament in Atlantic City, and would undoubtedly missed it had not his brother Charles been right behind in another car, who, after a brief and stormy scene, posted back to Philadelphia to see the old man and get the dollars. All Magnolia is going to see the trial.

OLDFIELD PLUNGES INTO A FENCE

He and a "Heroine" the Centers of Photography at the Poughkeepsie Meet.

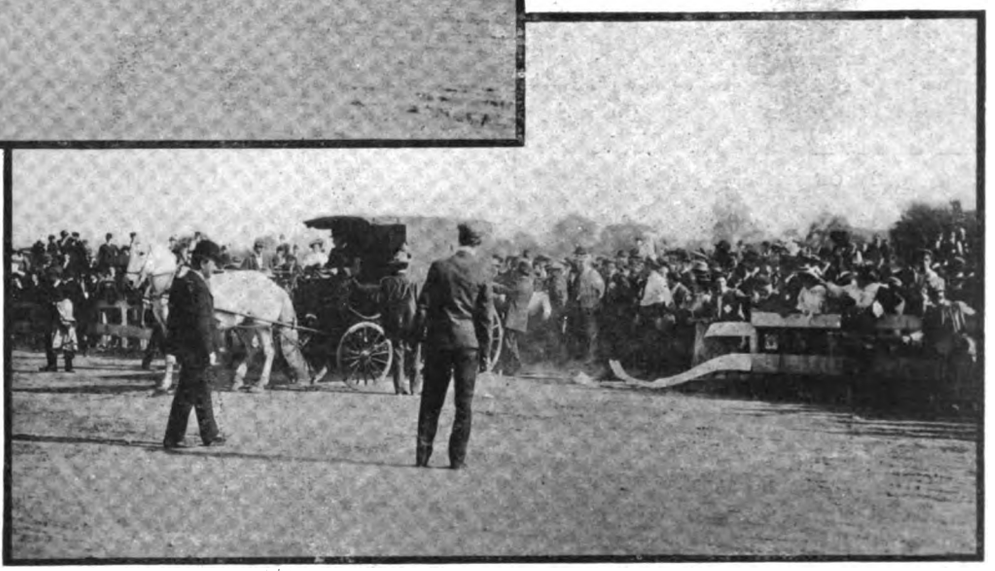
Barney Oldfield, in his 60 horsepower Peerless, fondly named by himself the "Green Dragon," dashed into a fence at the Poughkeepsie (N. Y.) meet on Saturday last, 30th ult. The fence was demolished, and Oldfield was carried off in an ambulance, which had been held in waiting for that very occasion.

OLDFIELD IN HIS FENCE SMASHING ACT.

Neither Oldfield nor his car was injured, however. The fence was constructed of cardboard, the whole "accident" having been prearranged for the immediate benefit of the moving picture machine man and for the ultimate profit of Oldfield and his theatrical managers.

Oldfield is out to corral the largest amount of negotiable coin he can—he himself long ago acknowledged it—and some time back his manager hit upon the happy scheme of having his "star" come before the limelight on a real stage during the long winter months. So Barney is to run his Peerless car on a treadmill arrangement and run thrilling races with himself for the benefit of those who never have had the opportunity of seeing the automobile "crack" whirl around the track in clouds of dust. To make the act in which Barney is to star seem more ralistic it is planned to have the cinemetograph reproduce on the screen pictures of Oldfield plunging through a fence. So this, the Poughkeepsie meet, was the chance for the photographer to execute his little part.

It was the last day of the Dutchess County Agricultural Society's fair, and, as last year, it was designated "automobile day." Perfect Indian summer weather, little dust on the track, the presence of nearly twenty thousand spectators and such stars as Oldfield, Cedrino, Wurgis, Wridgway, Mrs. Joan Newton Cuneo—there were a few more, but perhaps they will not be offended if their names are not mentioned—thrilling feats by a pair of diving equines and a female aeronaut, the aforementioned "accident," the "ten, twent', thirt'" shows on the pike, with numerous counter attractions thrown in, served to make this last day of the seventieth annual fair a red letter one in its annals.



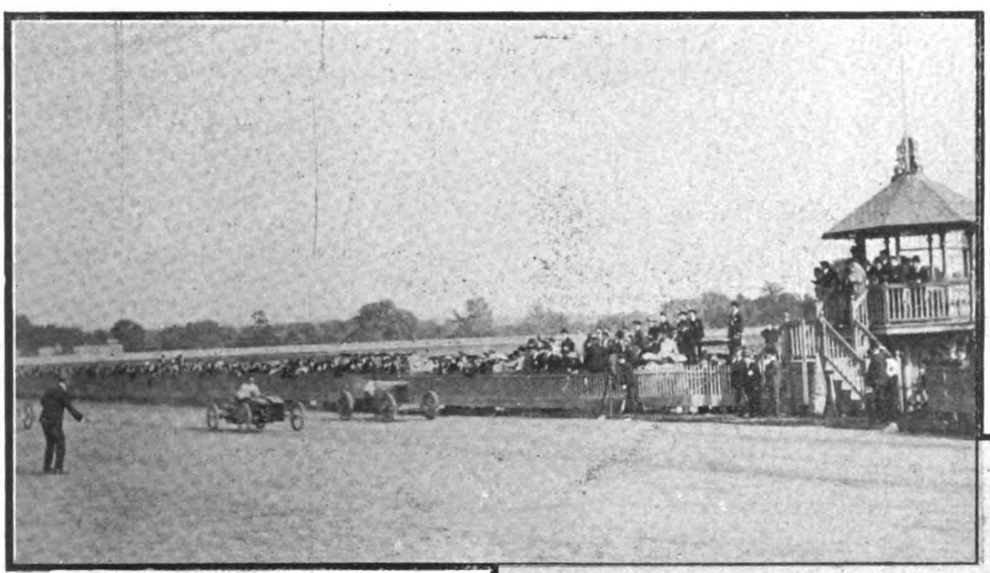
The meet was sanctioned by the American Automobile Association, and one of those peculiar championship races was not the least of its features. The "championship" event was at five miles, and Oldfield, in his 60 horsepower Peerless, won out handily, although to all appearances Dan Wurgis, 32 horsepower Reo, gave him a hard tussle for the honors. Charles G. Wridgway, former 1,000-mile record holder, in a 35 horsepower Peerless, finished third. Oldfield's time was 5:50 3-5. Then Oldfield thrilled the crowd by driving a five-mile exhibition in the fast time of 4:47 3-5, after which he took his car around the one-mile oval in 57 seconds. Then followed Oldfield's fence smashing and property blood shedding act, after the successful culmination of which his day's work was o'er.

For the occasion a section of the post and rail fence that inclose the infield had been replaced by a pasteboard structure. The moving picture machine and its operator occupied another car, from which the tonneau had been removed. This car ran along the track in front of and a little to the outside, while Oldfield in his Green Dragon, the habitual cigar stump in his mouth, came scorching down the course, with C. G. Wridgway in a Peerless running just a length behind, to represent his competitor. Just before the place for the accident was reached Oldfield wobbled his car skilfully a couple of times. Following the suggestion of the photographer the crowd, or that part of it which understood, waved hats and handkerchiefs, and nearly every one of the spectators was grinning as Oldfield crashed through the paper fence. As the car went through the fence Barney threw up his heels and rolled backward from his car in a fall realistic enough to guarantee his stage career.

Just then the photographe.'s assistant rushed up and daubed Oldfield's face with a sponge that had been soaked in red ink. Evidently Barney had not counted on such a "bloody" accident, for he was heard to ejaculate:

"What t'ell!"

But he had no time to make further cursory remarks, for by this time the hired-for-the-occasion ambulance came bounding up the track, its gong pounding as if the driver wanted its noise to get into the picture, and Oldfield was placed on the stretcher, which was included with the ambulance. One of the "cops" was so anxious about how he would appear on the screen of the theatre that he kept his face turned toward the camera and did not look whither he went. This caused him to stumble and nearly drop the grinning corpse. Arrived at the ambulance there was a hitch. The cops at the head of the stretcher wanted Barney put in feet first, while those at the feet end did not want to turn about. There was a brief pause for an argument. Finally Barney was pushed in



LOADING THE "VICTIM" INTO THE AMBULANCE.

Digitized by Google

head first. Then the ambulance went away at a gallop, the picture machine ceased its labors with a click, the crowd cheered and the best show of the meet was at an end.

A "star" is not necessarily a person who accomplishes some great feat—not at all. Notoriety and photographs make a "star." That is how Mrs. Joan Newton Cuneo, of Richmond Hill, Long Island, "heroine of the Glidden tour and the Atlantic City sandfest," comes to be included in the category. Mrs. Cuneo ought to be a happy woman, for was she not allowed to enter a handicap race

ONE OF THE STARTS.

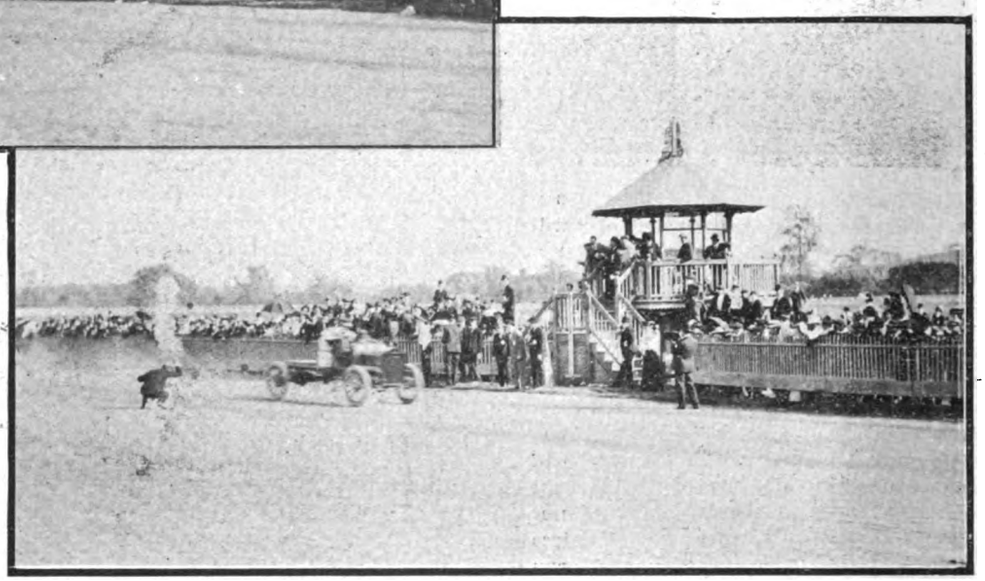
(which, by the way, she did not finish because of the horrible dust) and drive a mile exhibition? But, to make her happiness more complete, she was photographed something less than one hundred times, in all conceivable poses. In one she held her pose long enough to be snapped in the act of drinking a bottle of—it was either sarsaparilla or ginger ale. While she imbibed one of her attendants held aloft two other bottles. Of course, she was heartily cheered. The public usually welcomes any radical departure from the conventional, and it certainly was an innovation to have a driver in skirts participate in automobile track races.

Apart from these features, nothing startling happened. The closest race was the five mile pursuit between Emanuel Cedrino, 24-horsepower Fiat, and Dan Wurgis, 32-horsepower Reo. Neither car had an advantage until the last lap, when the Italian forged slowly ahead and won by thirty yards. Time, 5:08 4-5. Later, Cedrino drove a mile exhibition in 1:00 2-5. The other events developed into the usual runabouts, except the one mile open for runabouts. This was won by Charles Fleming in an 8-horsepower Maxwell by about a length from R. E. Randolph, also in a Maxwell. Time, 1:52 2-5.

At the tape in the two mile invitation for Stoddard-Dayton cars, nearly half a mile of daylight separated the cars of James McIlvid and E. A. Shotwell, the former leading. H. E. Randolph won the three mile event for Maxwell touring cars, after a running fight with Charles Fleming. H. A. Grant trailed third. Mrs. Cuneo was entered in the five mile open handicap, but withdrew after the third mile. She drove a White steam car. Charles Fleming received a generous time allowance of 3 minutes, and led by seven-eighths of a mile at the finish. E. Cedrino, 24-horsepower Fiat, the lone scratch man, finished second. Summaries:

One mile open, for stock runabouts—Charles Fleming, 8-horsepower Maxwell, first; R. E. Randolph, 8-horsepower Maxwell, second. Times, 1:52, 1:52 2-5.

Two miles, for Stoddard-Dayton cars—James McIlvid, first; E. A. Shotwell, second. Time, 3:28.



Five-mile pursuit between Emanuel Cedrino, 24-horsepower Fiat, and Dan Wurgis, 32-horsepower Reo—Won by Cedrino. Times, 5:08 4-5, 5:14.

Three miles, for Maxwell cars—H. E. Randolph, first; Charles Fleming, second; H. A. Grant, third. Time, 5:18 3-5.

Five miles, free-for-all, for points in national circuit championship—Barney Oldfield, 60-horsepower Peerless, first; Dan Wurgis, 32-horsepower Reo, second; C. G. Wridgway, third. Times, 5:50 3-5, 6:02 3-5, 6:15 3-5.

Five-mile handicap—Charles Fleming, 8-horsepower Maxwell (3:00), first; E. Cedrino, 24-horsepower Fiat (scratch), second; Dan Wurgis, 32-horsepower Reo (0:05), third; C. G. Wridgway, 35-horsepower Peerless (0:50), fourth. Time, 7:15 2-5.

Time trials—One mile: Barney Oldfield, 60-horsepower Peerless, 0:57; E. Cedrino, 24-horsepower Fiat, 1:00 2-5; three miles, Mrs. Joan N. Cuneo, 15-20-horsepower White, 4:37 1-5; five miles, Barney Oldfield, 60-horsepower Peerless, by miles, 0:57 2-5, 1:53 4-5, 2:51, 3:50, 4:47 3-5.

THE STARTER AND THE "HEROINE."

France's Substitute for Bennett Race.

Like a shift of the wind sentiment in France has veered from the racing game, and now blows with full force in favor of touring competitions. There is an annual fixture of this class in practically every country prominently identified with manufacturing, but France is loth to see her waning supremacy dwindle any more, so it is proposed that the French Automobile Club father the event of events in this category—le concours du concours, so to speak. The suggestion comes from the head of the De Dion house that a 3,000-mile contest be inaugurated through France, Italy, Austria, Germany, Holland and Belgium, with the start and finish in France.

It is said that the German club has signified its approval of the project, but has registered a protest regarding the distance, which is considered excessive. "But 5,000 kilometres is a small matter to the modern car, and in consequence a maximum must be fixed." This statement is attributed to the Marquis De Dion, who is also reported as saying that "the contest will not be a touring competition in the strict sense of the word, but an industrial struggle between makers of every country.

COMING OF COLD WEATHER

Some of the Things it Should Suggest to Motorists—Precautions That Pay.

Although there is as yet little indication of the approach of the cold weather, either in the quality or temperature of the air, still the tourist and he who rides afield at the week end sees in the foliage the unmistakable hallmark of the fall, and now and then in the hollows receives a blast of chilling dampness which tells in unmistakable language what perhaps his instinct and the calendar have not—that the winter is but a few paces off, as it were, and that its forerunners, the frost and the cold rain, are to be expected within a very brief time. That being the case, it behooves the motorist to bethink himself of certain very essential provisions which are to be made before the advent of that unwelcome season.

The epoch has well passed when the car owner uses his machine up to the time when the temperature becomes inconveniently low, and then sets it aside to wait for the coming of the spring. Instead, with few and rare exceptions, he goes on driving throughout the year, only taking to the older and less approved modes of conveyance when the combined efficiency of the weather man and inefficiency of the highway repair man have made the ways he is used to travelling wellnigh impassable, or when the excessive cold overcomes his hardihood and drives him to cover.

Although the motor car has been evolved, or developed, or simply grown to a point where it is to be relied upon to go its pace under all circumstances except the very worst, and although it has proven itself to be a faithful servant to the needs of man, and more to be trusted under stress of adversity than its predecessor, the horse drawn vehicle, there are yet certain conditions which must of necessity be observed in order to get from it the full measure of its work. These conditions in which the running of a car in the winter differ from those which obtain at any other season relate chiefly to two matters—namely, to the effect of cold upon the lubricants and upon the cooling water.

As to the effect of cold upon the lubricants, it is evident that the lower the temperature the more viscose becomes the oil and grease which is applied to the bearings, and that on this account when a car has been allowed to stand for any length of time in a cool place all bearings will exhibit a greater amount of friction than is their wont, and will continue to do so until they have become heated or until they are supplied with a thinner oil. On this account it is quite essential to keep track of the oil which is supplied to the more delicate parts of the machine, changing it as occasion seems to demand, and making sure from time to time that all ducts and passages are perfectly free from deposits of any sort which might tend to hinder the flow of the feed.

It is as yet rather early to take up the matter of the prevention of freezing of the cooling water, but it is well to bear in mind that some provision will become a necessity before many weeks if the machine is to be left out of doors at night for any length of time, and that careful experiment both in the laboratory and on the road has shown that a mixture of alcohol and glycerine, with the water, in a proportion varying with the temperament of the car, is to be relied upon at all times, and that by altering its strength as the colder weather comes on it may be made to serve efficiently throughout the season, with absolutely no danger to the car either from freezing or from the after effects which render the use of some of the nostrums which are placed upon the market prohibitive to the man who has any amount of regard for the welfare of his machine.

What Happened to Rockefeller.

John D. Rockefeller, Jr., who is touring Europe in an automobile, was recently ordered to "get a horse," but found it necessary to get eight of them and to enlist the services of twelve men in addition to pull his car and party, consisting of his wife and two friends, the chauffeur and gendarme. The party left Chamounix for Martigny over the Tete Noir pass, not knowing that automobiles are not permitted in the pass. The arrest was made at the village of Chatelard, where the gendarme captured the party and refused to allow anybody to drive the car. John D., Jr., evidently did not care if he never got there, and permitted the all important French constable to have his own way, with the result that the strange procession already described finally arrived at Martigny, where the usual heavy fines were collected. Just to show there was no hard feeling Mr. Rockefeller treated the gendarme and the twelve two legged horses to a good dinner.

And Now a Speedometer Contest!

There have been contests for this, that and the other thing, but the list is apparently far from being exhausted, for all the accessories of the car have not been made the subject of a public contest as yet. The German Automobile Club will inaugurate this end of it by holding a speedometer contest next spring—not to see just how much these instruments will stand without putting up a protest, but to arrive at the most reliable and convenient form, which, having established its supremacy under an elaborate set of rules and regulations, will doubtless receive official sanction thereafter.

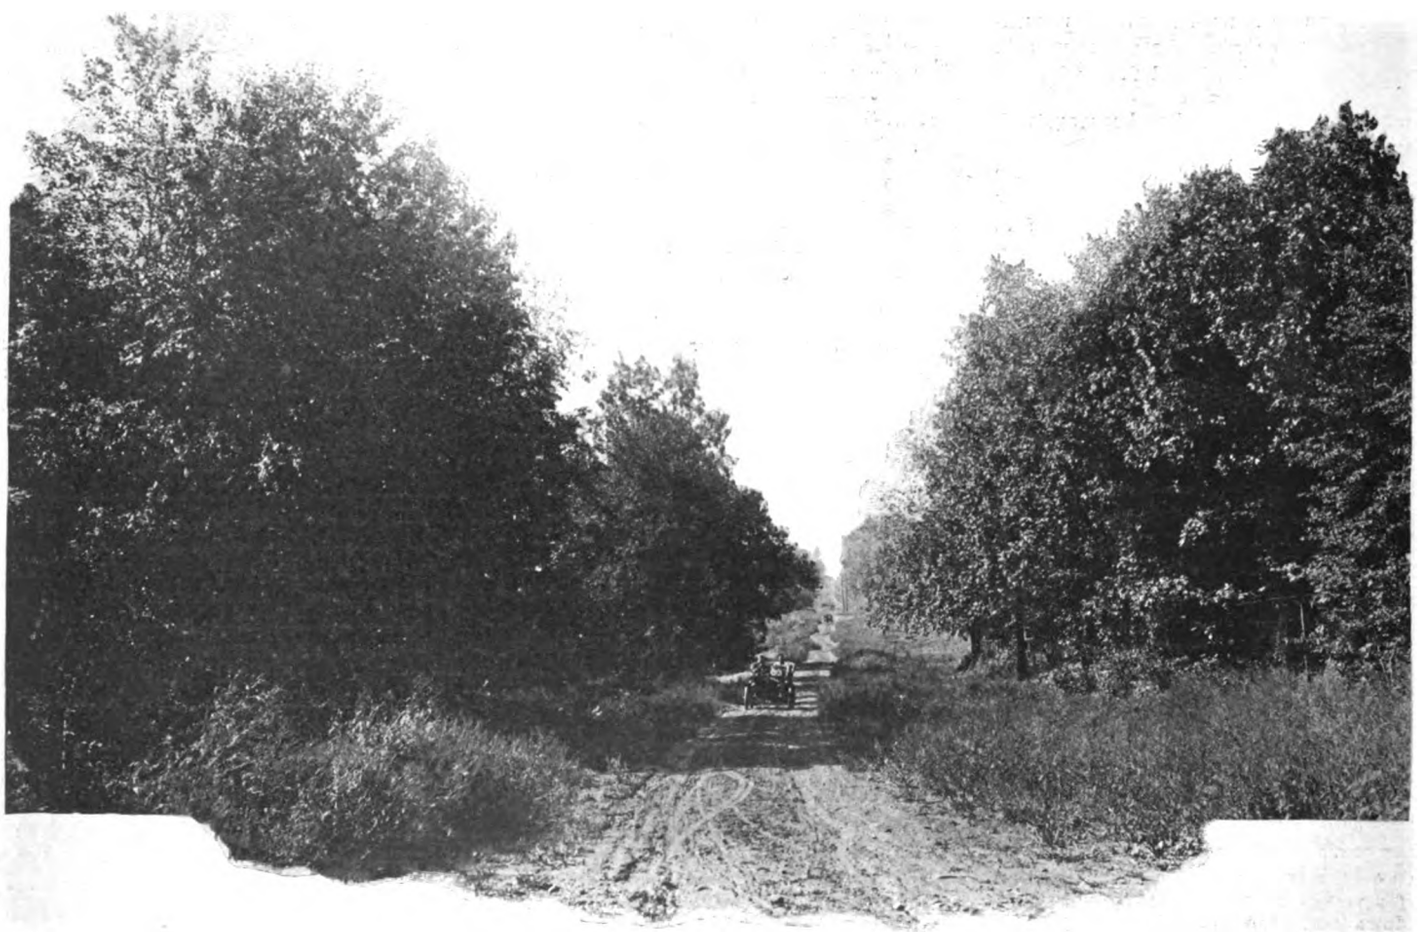
This Club Gives Cash for Good Roads

The Portland (Ore.) Automobile Club has come out strong for good roads. At the last meeting of the club it was voted to expend $5,000 to improve the highways in the vicinity of Portland; $2,400 was raised before the meeting adjourned for the oiling of the roads.

BAY STATE "SYSTEM" FAILS

Elaborate Police Trap When Tried in New York Catches No Victims and is Rejected.

New York's Police Commissioner decided that things were propitious to give his imported-from-Massachusetts system of apprehending scorchers a trial last week, and a gathering of the department's stop watch experts was stationed at Dyckman street and Broadway, near the entrance to the Boulevard Lafayette. Three telephone signal booths were established, each a quarter mile from the next, and extra sleuths with motor bicycles were on reserve duty at these points.



The system, according to the imported "expert," is as follows: Immediately an over speeding car passed station No. 1 a telephone message would be sent to No. 2. If the car had not already reached or passed that station, the expert on duty there would start and stop his watch before it did so—if he could. Having taken the time observation and reduced it to a miles per hour basis by mathematical calculation, and likewise having determined that the legal limit had been exceeded, he would then proceed to signal the third station, and an arrest would follow.

But more than one thing interfered with the smooth playing of the game. First and foremost, the stop watch experts proved bunglers with the 'phones and experienced considerable difficulty in managing them as per schedule. Then, again, the victims would not oblige, either by running over the marked course, or by exceeding the limit when they did so. Public knowledge of the establishment of the stations caused drivers to avoid the course, while those who did not "spotted" the booths by their signs and gave the experts plenty of opportunity to calculate their exact rate of travel by slowing down to a point that made figuring it out an easy matter.

Even where an arrest is made, there are some large holes in the system through which the victim may escape. In the first place, an arrest suspends operations until the three experts necessary to make a complaint can return and get busy again. Because of the lapse of time in making telephone connections between stations, stop watch records cannot be accurate, and in the interim the driver may change places with a passenger, thus making specific arrests impossible. Bicycle Policeman Casey and his confreres were unanimously agreed that the former method of catching the offender by chasing him on a motor bicycle had the new system "faded," while the cost of maintaining the "system" removed any lingering doubts the Commissioner himself may have had. What the young man who devised the system and was brought from Massachusetts to operate it thinks is not a matter of record or of great concern.

PICTURESQUE SPOTS IN THE ORANGE MOUNTAINS.

Digitized by Google

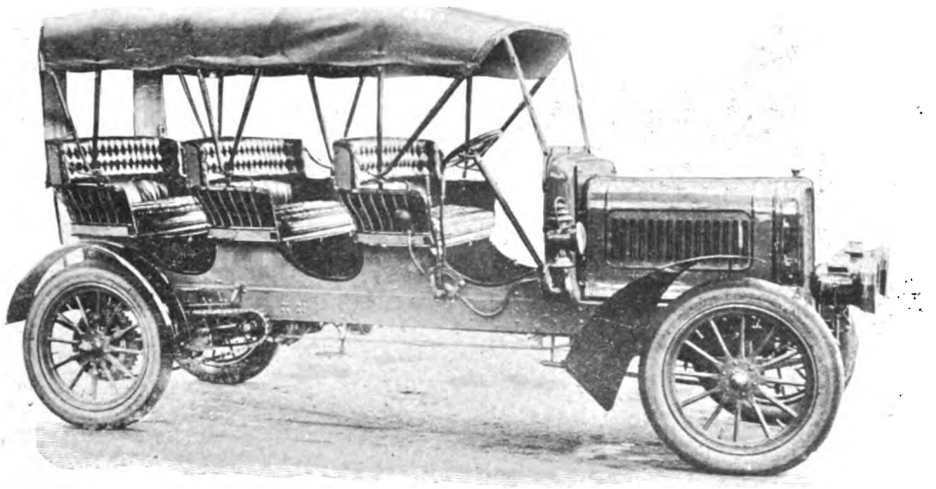
Beauty Spots Almost in Sight of New York.

ONE OF THE WOODLAND BYWAYS IN THE ORANGE MOUNTAINS.

Within fifteen miles of New York, perhaps it is twenty miles by way of Newark, may be found touring as delightful as may be found in the Mt. Washington district, roads as fair as any in Europe, hills, valleys and wild wood scenery in plenty.

The New York automobilist who wends his way to Newark via the Plank Road, which is horrible, or via the Turnpike from Jersey City, a road now rapidly being made a boulevard through improvements, will be wise to go out Springfield avenue straight to Maplewood, to Chatham and Morristown. Just before reaching the heart of Morristown a turn will be encountered, rounding which a beautiful road will be found leading in a winding way into the Orange Mountains. One mile from the turn there will be unfolded a view as grand as any to be found in Europe, a road which goes gradually down and down and then up and up, and which may be seen for miles. Along this road will be encountered countless cross roads, any of which may be followed, and all of which will yield beautiful scenery.

But one there is which is hidden in a way by weeds, and a turn to the right into this will lead into what is known as the Essex County Park Reservation, but the term park is a misfit, as the country is wild and interesting, while the roads are of the country variety, but grand in the extreme. A straight stretch is followed by a long letter "S" curve, and then comes a glimpse of a brook, and the road follows along this brook for miles, as pretty driving as any one could wish. The outlet is at Millburn, but the driver should retrace the route to South Orange avenue and go up the steep grade which he left. This road will wind up and up to the top of the mountain, and from the summit will be gained a grand view of South Orange and other of the Oranges.



Once down the steep hill to South Orange the trip may be extended, following the car tracks where the curve to the right to Maplewood and thence to Short Hills and down the beautiful hills which give the territory the name. This will again lead the tourist into South Orange avenue after many miles of beautiful road, and then the trip may be taken again through the district in almost any direction and out from South Orange toward Llewellyn Park and thence up St. Cloud hill to the top of the mountains, along which a road winds which ultimately carries the tourist down the famous Eagle Rock Hill, the scene of so many great hill climbs. The views from the heights are glorious.

In general, the tourist should merely decide to tour through the Orange Mountains and then follow any old road, for all lead to somewhere, and all hold delightful views and beautiful roads such as may be found nowhere else so near to New York.

Pope Turns to Wagonettes.

For use in Nevada to convey prospectors back and forth from the mines, the Pope Motor Car Co. has turned out an entirely new type of vehicle, with a high powered engine, and will make them on orders in future.

POPE'S NEW WAGONETTE.

This new Pope-Toledo is known as a three-seated wagonette; the first one, made for Charles Christmas, is shown by the accompanying illustration. It has a four cylinder engine, supplying 45 horsepower. The cylinders are 5x5¾ inches. It has jump spark ignition, the usual Pope carburetter, a rotary and gear driven water pump and an external cone clutch of new design. The new system of cooling known as the Pope-Toledo planetic, an entirely new principle, is incorporated in this wagonette.

The frame is of wood, re-enforced with steel plates. It has a gasolene capacity of thirty gallons, sufficient for 450 miles. The wheel base is 114½ inches, and three persons can be seated comfortably on each seat.

Logan's Latest Truck.

One of the marks of the rapidly increasing importance of the commercial motor car is the fact that the crop of 1906 models is being placed on the market much earlier than has ever been done with touring cars, and that many of the makers of other types of car, as well as the commercial vehicle, are striving to get out their truck models in advance of the others. Of these, the Logan Construction Co., of Chillicothe, Ohio, is just announcing a new 30 horsepower one and one-half ton truck, which it is building for the forthcoming season.

In so far as the general layout of the machine is concerned, this model is not unlike the former commercial vehicle put out during the present year, and as to chassis and power plant it also resembles the Logan touring car. That is to say, it is equipped with a double opposed motor set longitudinally under the body, with automatic inlet valves of liberal size, and designed for a speed variation of 150 to 1,400 r. p. m., has a two-speed sliding gear transmission and contracting band clutch.

The chief points of difference between this and the older models lie, first of all, in the cylinder dimensions, which are 5½x6 inches; then the transmission is fitted with an additional brake, and the carrying space is much greater than that in the lighter powered wagon, there being eight feet in the clear behind the driver's seat. In the later cars the body equipment will, of course, be at the option of the purchaser.

LOGAN TRUCK DOING HEAVY DUTY.

The illustration shows the first machine of its class, which has been constructed for the Depot Carriage & Baggage Co., of Kansas City, Mo.

On October 15, the new Absecon, Port Republic and Tuckerton automobile stage line, in New Jersey, will begin operations. Two cars, making two round trips daily, will be used. The round trip fare will be one dollar.

Ruggles Tries His Wagon on Ware.

F. A. Ruggles, the Ware (Mass.) man who, some time ago, "received valuable patents on automobile construction," is now endeavoring to interest the Ware Business Men's Association sufficiently to aid him in launching a stock company. While waiting for his stock company to materialize, Ruggles has leased the old electric light building in Ware and has already begun operations.

Little is known of Mr. Ruggles' "valuable patents on automobile construction," but the Ware correspondent of a Springfield paper states that "The vehicles manufactured will be laundry and grocery wagons, and later on heavy trucks. Mr. Ruggles' patent does away with chains and gearing, the wheels working by friction. A small engine on one of the Ruggles automobiles will do the work of an engine of several more horsepower on the old style automobile. A 1700-pound truck wagon was on exhibition to-day, Mr. Ruggles taking it about town and showing the workings to the merchants and business men. The truck was run by an engine of small horsepower, but bowled along Main street as easily as though run by an engine of 40 horsepower. There is considerable enthusiasm over the prospect of the several new industries in Ware."

May Establish Parcel Express.

As a result of the refusal of the city of Holyoke, Mass., to grant the petition of a railway company for a parcel express privilege, there is every probability that an automobile parcel express will be established within a short time. Alderman George Bennet is quoted as having said at a recent meeting of the aldermanic body that a group of capitalists stood ready to back such an enterprise, and there is every reason to suppose that there is something of the sort in the wind.

GLIDDEN GOING AGAIN

Will Begin in India Another Installment of His Globe Girdling Tour.

Charles J. Glidden will leave Boston on the 24th inst., to undertake another chapter of his around the world in instalments tour, which many erroneously thought he had concluded upon his return to this country last spring.

"When I first contemplated touring the globe in a car a journey but once around appeared necessary to enable me to make drives in all desirable countries," said Mr. Glidden. "Climatic conditions are such, however, that to insure health and comfort another circling of the globe is advisable, as many of the countries on the itinerary are within the tropical regions and should be visited only in our winter months."

It will be recalled that Mr. Glidden has been engaged in globe girdling ever since 1901. In that year and the three following he devoted himself to visiting the Northern European countries, and in the latter part of 1904 crossed America and, after having driven through such far southern countries as Tasmania, Fiji, Neaw Zealand, Australia and Java, presumably concluded his tour by returning to Boston in June of the present year. This gave him a record of 25,100 miles in twenty-four countries, which he expects to make 30,000 miles in thirty-one countries before returning to Boston in June, 1907.

The route of the present trip will be by steamer to Bombay, India, via Plymouth, England, and Marseilles. December and January will be devoted to India, February for Burmah and Ceylon, March for Siam and China, April for the Philippines and May for Japan, returning via the Pacific. Most complete preparations have been made in advance. Agents in all the principal cities have been informed as to the probable time of arrival, and will be given exact dates as the tourists approach them. Interpreters and servants have been engaged where necessary; gasolene and lubricating oil provided for at necessary points; hotel accommodations have been secured and military protection arranged for where thought advisable by the authorities. Steamship sailings and accommodations for the car have all been prepared in advance, as well as facilities for passing through the customs at the various ports. In addition to the complete equipment carried, extra parts and tires will be forwarded to Calcutta, Colombo, Singapore and Yokohama. The specially constructed wheels used in running on the tracks of the Canadian Pacific Railroad last year will also be sent ahead to countries where there are no available roads.

Not content with this achievement, Mr. Glidden figures that Algeria, Tunis, Sicily, Tripoli, Turkey, Egypt, Spain, Portugal, Russia and the South American republics are countries that will still remain to be visited, extending the drives into 1911, or ten years from the beginning of the undertaking. This would increase the mileage to approximately 50,000 and the number of countries visited fifty.

"Big Liz" Absent from Baltimore.

At Electric Park, Baltimore, Md., last Thursday night, 28th ult., an electric light automobile race meet furnished entertainment for more than 2,000 spectators. One of the notable absentees was Howard Gill and "Big Liz," his specially built steam car. This was somewhat disappointing as "Big Liz" was entered in the five-mile open for the "Championship of Maryland." As every meet held in Baltimore this season has contained a "State Championship" event, Mr. Gill may yet have a chance to win the honor, if such it be.

In the five-mile event Edward Buchanon, in a stripped 30-horsepower Pope-Toledo, won the first heat from Clyde Lozier, who drove a 20-horsepower car. The second heat was taken by Albert Wagner. The final between Buchanon and Wagner was the most exciting event of the evening. Wagner jumped into the lead at the start and succeeded in stalling off Buchanon's most persistent efforts to go past until the last lap. Then Buchanon, in the Pope-Toledo, went ahead and won out in a driving finish. Time, 8:39.

In the mile judgment race, the driver covering the distance nearest to two minutes to be adjudged the winner, Thomas Goodwin was awarded the prize, his time being 1:56. Edward Buchanon was second, in 1:46, and Clyde Lozier third, in 1:45.

Raymond Thomas, on a one and three-quarter-horsepower Indian started from the scratch in the five-mile motorcycle handicap and at the tape was nearly half a mile ahead of L. J. Hayden, one and three-quarter Rambler, with one-quarter of a mile handicap. Time, 8:29. Summaries:

One-mile judgment, one driving nearest to two minutes—Thomas Goodwin, 35 h. p. Columbia, first. Time, 1:56.

Five-mile handicap, motorcycle—Raymond Thomas (scratch), 1¾ h. p. Indian, first; L. J. Hayden (one-fourth mile), 1¾ h. p. Rambler, second; Herbert Webber (one-eighth mile), 1¾ h. p. Indian, third. Time, 8:29.

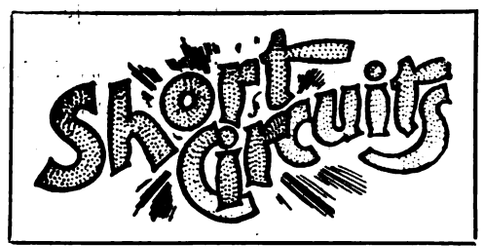
Two-mile handicap—Albert Wagner (100 yards), first; Clyde Lozier (scratch), second; Thomas Goodwin, 35 h. p. Columbia (200 yards), third. Time, 3:05.

Five-mile free-for-all—First heat—Edward Buchanon, 30 h. p. Pope Toledo, first; Clyde Lozier, second. Time, 8:46. Second heat—Albert Wagner, by default. Final heat—Edward Buchanon, first; Albert Wagner, second. Time, 8:39.

Following the route taken by his brother, J. W., Elwood Haynes yesterday left the Haynes Automobile Company's factory in Kokomo, Ind., for a tour of the East, stopping to do business at all of the larger cities en route. He is using the other four-cylinder car that is included in the Haynes 1906 line.

WORM BEGINS TO TURN

Long Suffering Massachusetts Animal Fights Back—Plans to Fool the Grafters.



Conditions in the Bay State have reached a stage where automobilists generally are of the opinion that it is high time for persecution at the hands of rural constables to be ended. The Massachusetts Automobile Association, comprising seven clubs located in various parts of the State, has accordingly issued a circular letter requesting financial assistance and co-operation in a campaign to prevent the passage of adverse legislation and to further that of any favorable laws that may be proposed.

The recent arrest of E. A. Gilmore, manager of the Rambler branch in Boston, proved the last straw. Accompanied by a friend and a representative of one of the tire companies, he left Boston on Saturday morning for a trip to Providence in order to attend the races there. A start was made in ample time, and the fifteen-mile an hour limit was being carefully observed and checked by the speedometer in order to be immune from the attentions of the overzealous constable. But the party was held up near the Rhode Island line, nevertheless, and accused of speeding, to their great surprise. Asked what he made it, the all important official announced with a cocksureness that took away the breath of his hearers that the car had been running at 16.67 miles an hour exactly. The testimony of an accurate speedometer supplemented by the two witnesses was not sufficient to counteract that of the "corn-stubble's" stop chronometer, and a fine of $10 was imposed. An appeal was taken, and the case will be carried through to the highest court, if necessary.

The Worcester Automobile Club has also undertaken a campaign of its own with the same object in view. It has circulated a letter strongly advising all members that, instead of meekly giving up when fined by some roadside justice of the peace on the unsupported testimony of a constable, to appeal the case in every instance and without fail. It is said to be a matter of common knowledge that the great majority of arrests in that State, which total hundreds monthly, are made solely for the graft accruing to the local hamlet and the constable. Accordingly in appealing every unwarranted arrest two things are accomplished. In the first place, it will cost the county far more than the amount of the fine, and if in the end the fine be imposed it will revert to the county instead of the town.

An automobile passenger and freight line from Stroudsburg, Pa., to the Forest Park, a resort sixteen miles out, is being planned by Arthur Lederer, the proprietor. This line will be in diect opposition to the Delaware Valley Railway, and will probably embarrass it not a little. This corporation came into prominence some little time ago by its close escape from going to the wall as a result of a scrub woman's appeal for a debt of $1.

The New Jersey Automobile and Motor Club is already planning for the Eagle Rock hill climbing contest. As usual, it will be held on Thanksgiving Day.

Elkhart, Ind., now has an automobile club, taking the name of the town. Organizatiou was perfected last week, when these officers were chosen: President, C. G. Conn; vice-president, G. A. Briggs; secretary, R. C. Barney; treasurer, J. A. Cook.

A Kansas rural editor, commenting on the rumored $400 automobile, has this to say of a brother quill driver: "This announcement causes us to remark that when they cut off two ciphers more from the cost that we know where one more machine can be sold."

Buffalo is said to be suffering from a famine. There are not enough men to drive all the cars that are owned in the Lake City. The combined output of the Pierce and Thomas factories and the Y. M. C. A. training school is reported to have fallen far short of meeting the demand.

It is not a new twist to the venerable mother-in-law joke, but a fact, sans veneer, that a wealthy Jerseyman traded in his touring car and bought a runabout, giving as the reason that his mother-in-law always thought there was room enough for her so long as he had the touring car.

A bi-daily automobile touring car service between Philadelphia, Pa., and Atlantic City, N. J., has been inaugurated. Regular trips will be made on Tuesdays, Thursdays and Saturdays, starting from the Bellevue-Stratford Hotel, in Philadelphia, at 2 p. m., and from the Chalfonte, Atlantic City, at that hour on Mondays, Wednesdays and Fridays.

Automobile owners in Centre County, Pennsylvania, have organized the Automobile Association of Centre County, with headquarters at Bellefonte. These officers were elected: President, George C. Watson; vice-president, A. C. Mingle; secretary-treasurer, Robert F. Hunter; directors, George C. Watson, C. D. Fehr, John Porter and R. F. Hunter.

Not to be outshone by the greater Eastern cities whose capacity for orphans was so much in excess of their own that they outdid them in point of parade front on "Orphans' Day," the members of the Minneapolis Automobile Club went a step and a half further the other day and gave an outing to the nurses and nuns who care for the poor little orphans.

"Gasolene lid" is the most recent addition to the vernacular. Like the majority of terse and expressive bits that go to make up American slang, its meaning has but more or less remote connection with its apparent import, for it is merely the official slang appellation for automobile cap, and has no connection whatever with any part of the machinery or the car.

The Automobile Club of Washington (D. C.) completed its organization by the election of the following officers on Friday last: President, W. S. Duvall; vice-president, C. S. Wood; secretary LeRoy Mark; treasurer, H. B. Wilson; captain, R. B. Caverly; lieutenant, Frank H. Edmonds; board of governors, Burr N. Edmunds, F. B. Pyle, Fulton R. Gordon and Frank H. Edmonds.

Virtually excluded from the streetcar lines of the City of Nashville, Tenn., by a recent municipal enactment, the negroes of that burg have organized for themselves and on their own responsibility a Jim Crow motor car line. Whether or not it will be a success, of course, remains to be seen, but the action of the city has caused a loss of something like $700 a week to the railroad company at all events.

According to the latest statistics issued by the Contributions Directes department, the number of automobiles in France registered for taxation purposes is 17,107. Of these, 12,713 can seat more than two persons. Paris is represented by 3,146 automobiles, 2,613 of which have more than two seats. The number of horse carriages in France is 1,637,562, and that of cycles 1,150,098, including 16,118 with motors.

The Windy City's latest claim to fame, the reputation of her holding the "only national show" being ignored for the present, is that she holds the record for the youngest "choffer," this being one of the many Chicagoese variations of the word. He is Harold Gourdain, twelve years of age, and is reputed to have mastered a 40-horsepower Thomas car to a degree that puts the average hired man in the leather suit to the blush.

Wth the aid of an automobile General A. R. Chaffee, commander in chief of the United States Army, is said to have recently fought the battle of Waterloo out for the satisfaction of himself and a party of American Congressmen by running over that historic field in a car. Beginning just as Napoleon and Wellington did, the car coursed back and forth, as did the opposing armies almost a century ago, and, needless to add, showed how Napoleon could have won it.

The automobile is now proving itself a factor in the settlement of the labor problem, at least as a means of enticing strike breakers to printing shops where labor troubles are in progress. Three autobuses provided the means of recruiting, and after hours the non-union force was treated to a three hour "seeing Chicago" ride, which an officer of the Chicago Typothetæ is of the opinion is the best means ever discovered of preventing desertions.

An occasional vein of humor is apt to crop out even in that most serious of affairs, a prosecution for exceeding the legal limit. It is a matter of record that the prosecuting attorney in a recent case so shuffled the papers of the numerous petty cases summoned for trial that day that the over-the-legal-limit offender was seriously accused of selling adulterated milk. But the fates were kind, for the error brought forth so much merriment that the motorist subsequently got off scot free.

A car for the "advance man" is heralded as the latest development in the use of the automobile for business purposes. The first one to take the road left New York on Sunday afternoon last bound for Pittsburg, with Maynard Waite, who is the advance representative of Robert Edeson's company, at the wheel. From Pittsburg the route will be through Cleveland, Detroit, Chicago, Minneapolis, St. Paul, Milwaukee, St. Louis and Kansas City, proceeding as far West as Denver.

"Any American who motors on the other side cannot help looking forward eagerly to the time when his own country will afford such splendid sport," said one of the many returning tourists who have spent the summer speeding over the endless smooth stretches afforded by the Continent. "That is why it is a good thing that thousands of devotees of the car go abroad each season. They come back each one determined to further the campaign for better built highways at home."

There is one man in the employ of the New York City Street Railway Co. whose duties might seem a round of pleasure to some automobile enthusiasts.

It is his business, whenever word is received of a collision of one of the company's cars with an automobile, to jump into the machine provided for him, hasten to the scene of the accident and inform himself as to the extent of the damages suffered by the injured automobile, so as to be able to testify in the company's behalf if suit is brought by the owner. Motormen must have the automobile habit, for he is kept pretty busy, though he exercises other and subsidiary functions in the company's service.

100 MILES PER HOUR

Almost, but Not Quite Attained, and Why—Big Road Races Practically Abandoned.

Paris, Sept. 19.—The events of the past season have given astonishing proof of the progress that continues to be made in the construction of motor cars. The long distance races over the Ardennes and the Brescia Circuit have shown higher speeds than have ever been attained over courses of this description, and yet it is admitted that the cars did not travel so fast as they ought to have done, in view of the fact that the engine powers and gears have in many cases been calculated for speeds of 100 miles an hour. This limit is, of course, a purely arbitrary one, for the makers obviously cannot take into account the varying resistances of road surface, which differ considerably on every course, and is always a fluctuating factor; but nevertheless it is fairly certain that many of the big cars competing this year would have very nearly reached the 100-mile limit had the drivers deemed it prudent to let the vehicles run all out.

As a matter of fact, there are several things that are constantly fighting against these exceptionally high speeds. The course is never straight, and as the cars have to be repeatedly slowed down to a safe speed when taking bends the average falls considerably in a long distance race, while the professional driver has had so much experience of the limitations of the pneumatic tire that he finds it better for his chances to keep down the speed so as not to heat his tires unduly, rather than to wear out several sets of tires and lose a quarter of an hour each time in replacing them. Thery attributes his success largely to the fact that he never allows himself to be hurried by competitors who are going faster on the first round or so. He knows the speed at which he can drive with a minimum risk of tire troubles, and if he takes five minutes more than another car on a round, and this car loses a quarter of an hour with the tires, he still has ten minutes to the good. This is the principle that guides most successful racing men, and explains why the times are not usually so good as might be supposed from the good character of the course.

That the 100-mile average is not a myth is shown by the recent performance of the new Mors car at the Provence meeting, where the vehicles competed over a straight stretch of five kilometers for the Rothschild cup. The car has a 120-horsepower engine and was piloted by a professional who has not yet made any name for himself in speed contests. He covered the five kilometers in 2:00 1-5, which is equal to an average of 90.3 miles an hour. This performance seems to suggest that there are other cars capable of doing the even 100 miles. The Mors beat the Mercedes, driven by Stead, by 6 2-5 seconds.

The progress of car construction is, however, particularly remarked in the hill climbing trials, where the engines have to work to their fullest capacity, and the cars are subjected to the severest possible test. As the engine is constantly running under full load, it will very soon reveal any defect in the cooling arrangements or lubrication, and an increase of speed depends largely upon the economy of transmission, while every part of the vehicle is submitted to the maximum strains. It is, therefore, a real test of efficiency, and the times made every year are very valuable as a means of showing the improvements carried out in motor cars. No gradient offers a more searching test than the thirteen mile road up the Mont Ventour, where the incline increases from 6 per cent at the start to 13 per cent at the top. The rise is maintained steadily the whole way without the slightest drop, and the load, therefore, increases just at the moment when a badly designed motor is the least able to support it. To add to the difficulties, the road is constantly winding, and needs very skilful driving to get to the top at high speeds without accident.

Among the touring cars very few big firms were represented, but it is interesting to see the success of those makers who have always made a special feature of the hill climbing capabilities of their cars, the Chantiers de la Buire winning in both categories in which they took part. The Chantiers de la Buire are a big engineering concern in the Loire, who make a side line of motor cars, and the feat of one of these vehicles in climbing the Mont Ventoux in full touring trim in 24:19 is a very meritorious one. In both cases the Buire cars beat the Berliets, which have also a high reputation as hill climbers. It was, however, among the racing cars that the records went by the board, and the Fiat again covered itself with honor, Cagno driving up his vehicle in 19:30, beating last year's record by nearly two minutes. Rougier, on his De Dietrich, was only 15 seconds behind, and a Rochet-Schneider and the Mors of Collomb, which a few days before won the Rothschild cup, were beaten by three and four minutes, respectively. The Darracq voiturette got to the top in 25:39 4-5, thus beating the previous record by 4:19. Such figures are eloquent of the higher efficiency of this year's cars, and show that they have undergone an all-round improvement.

It is perhaps a little too early to say that racing has seen its day, and that the present year, which the Auvergne, Ardennes and Florio cup races, marks the end of long distance speed contests, but for the moment everything points to the fact that the organization of races in Europe will henceforth be entirely abandoned. Nothing more is said about the Grand Prix which France was to inaugurate next year to take the place of the Bennett contest, and there is no doubt that the idea has been definitely abandoned in favor of the great trial of touring vehicles which is to take place around Europe. In Germany there was some talk of promoting a race between Berlin and Vienna, but although there may be one or two isolated events of this kind, it may be said, in a general way, that motor car racing is dead, and will be replaced by big touring tests, in which an effort will be made to work up a universal interest in motoring.

The only country in which there seemed a possibility of racing being carried on was in Italy, but even here it seems as if the present racing enthusiasm is merely a flash in the pan, for the president of the A. C. of Milan, which is the most powerful and influential body in Italy, has announced that the club will no longer patronize racing in any shape or form. The president states that the tendency at the moment is in favor of touring trials, and this is the direction in which the movement is to be carried on in Italy.

The A. C. of Milan intends next year to promote a big touring trial, and for this purpose the president has interviewed James Gordon Bennett with the idea of inducing him to hand over his cup for that event. Mr. Bennett has agreed to this proposal, subject to an understanding being come to with the A. C. of France.

A meeting of representatives of the French and Italian clubs is to be held shortly to discuss the expediency of handing over the cup to the A. C. of Milan for its touring car trial, for which money prizes to the value of $30,000 have already been offered. Thus there is every prospect of the Bennett cup becoming a prize for touring cars, a fate that cannot but be regretted by all automobilists who think that, having done so much for the international industry, the glorious trophy should be allowed to remain, with the laurels it has gathered, in the motoring archives. There is nothing to prevent Mr. Bennett from presenting another cup for a touring competition.

Drawing the Law Fine.

Those English bobbies have a most exasperating way of seeking to enforce their laws clear down to the very last letter, and frequently in their effort they go a bit further and include the punctuation as well. For instance, not long ago, a man was summoned for driving a car to which "a second was attached by a rope," as the complaint quaintly worded it, the second being an unfinished chassis. The dealer's identification mark was attached to each of the cars, but some watchful minion of the law deemed this to be in some way irregular, and accordingly haled the driver into court. There it was shown that while the second machine was undergoing a species of testing process, the first was neither "on trial after completion nor on trial by an intending purchaser." Undoubtedly the driver would have been fined for a violation of the law had it not been for the fact that the indictment failed to show which of the two machines was complained of, and on that ground the case was dismissed.

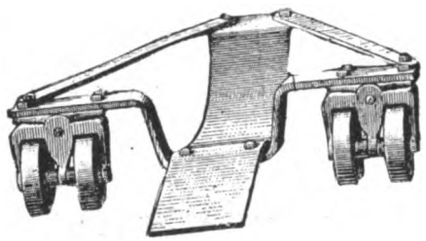
Biggest of Ball-Bearing Plants.

The Standard Roller Bearing Company, Philadelphia, has during the last year purchased a large amount of machinery especially designed for producing annular ball bearings, and now claims the largest capacity for making such bearings of any concern in either Europe or America. A special building, 70 feet by 125 feet, devoted exclusively to a department for hardening and tempering ball and roller bearings, has been completed, enabling deliveries to be made with dispatch. The furnaces are equipped with a special apparatus which tells the exact degree of heat in each furnace, so that the foreman at all times can tell the heat of the steel that is being treated, so that accurate results are always secured, which is not possible when the eye alone is trusted for determining the temperature.

The recent purchase by the Standard Roller Bearing Company of the Federal Manufacturing Company's ball business resulted in giving a capacity of two million completely finished balls daily. In order to take care of this branch of the business, a new 500-horsepower Brown engine and 300 K. W. Crocker Wheeler generator have just been installed.

The plant, which is claimed to be the largest in the world devoted exclusively to the manufacture of anti-friction bearings, steel balls, ball and roller bearings, is of colossal proportions. The main factory is nearly 600 feet long, and the ball plant 300 feet long, three stories in height, the total giving 145,000 square feet, in addition to which there is a large power plant, with about 1,000 horsepower in engines; also brass and iron foundries, tempering rooms, etc. The Standard people have a standing invitation to any one interested to inspect the entire place.

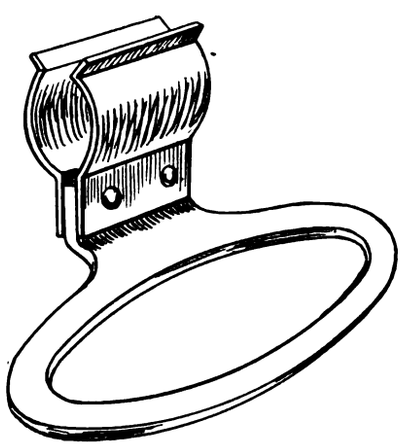


Departure in Insulated Wire.

A Berlin firm is making an insulated wire which is claimed to be far superior to any hitherto put on the market. For a long time past silk and cotton have been almost exclusively employed for insulating wires in electric machines and apparatus, but the fibrous nature of these materials renders them liable to absorb moisture, and thus necessitates the use of a varnish-like insulator as well to impart to them their requisite hydroscopic character. As it is impossible to reduce thread beyond a certain thickness, the varnish causes the insulating material to swell more than is desirable in cases where the winding space is so limited. The double-silk wire is only one millimetre thick. In the main it consists of cellulose-tetra acetate. A special machine puts the insulator on the copper wire in layers. The acetate is insusceptible to temperatures up to 150 degrees centigrade, and capable—at the above-mentioned thickness—of resisting high potentials.

A municipal watering cart which has recently been put into service in the city of Turin, Italy, is equipped with a 16 horsepower motor, and has the distributing nozzles located in front, where they are fed by a couple of pumps, which supply the water at a pressure of 30 pounds per square inch.

Making the Motor Car Movable.



A convenient little accessory for the private garage, and one which the motorist can have made by the local blacksmith in case he is not able to secure the somewhat similar patented article from a dealer, is the portable truck for handling the car while it is being shifted about on the floor. Such an one is made up of four sets of castor trucks, one of which is placed under each of the wheels of the car, raising it slightly from the floor and permitting it to be turned in any direction at the will of the operator.

As shown in the cut, the device is constructed entirely of strap and sheet iron, roughly shaped up and bolted together, the castors being the only part which cannot readily be made in the shop. A set of trucks made in this way will be found to be a great saving, particularly in a garage where space is at a premium, serving at once the purpose of a turntable and a transfer truck, while when not in use the four little carriers may be stored under the bench or in any convenient place, where they will take but little room and will be ready for instant use when needed.

For Testing the Spark Plug.

Some time since much was said of a certain invention which was to lessen the cares of the motor car driver many fold, by providing him with a method of holding a spark

plug which was to be tested and insuring its good contact with the ground. The invention consisted of a casting which was threaded to fit the hole in the cylinder into which the plug was screwed in its normal capacity, and which had at its upper extremity a hole also threaded and adapted to receive the plug. In use the device was to be screwed into the cylinder in place of the plug, and the latter inserted in it, where it would be firmly held while under test and inspection.

The great disadvantages of this and all of the similar devices which might be contrived is that in order to use them it is necessary first to screw the arrangement into the cylinder and then to screw the plug into the device. A far simpler scheme and one which involves little or no expense is to permanently affix to the motor a little clip made of sheet metal, into which the plug may be set when it is desired to test it, and which does not interfere in any way with any of the mechanism of the machine.

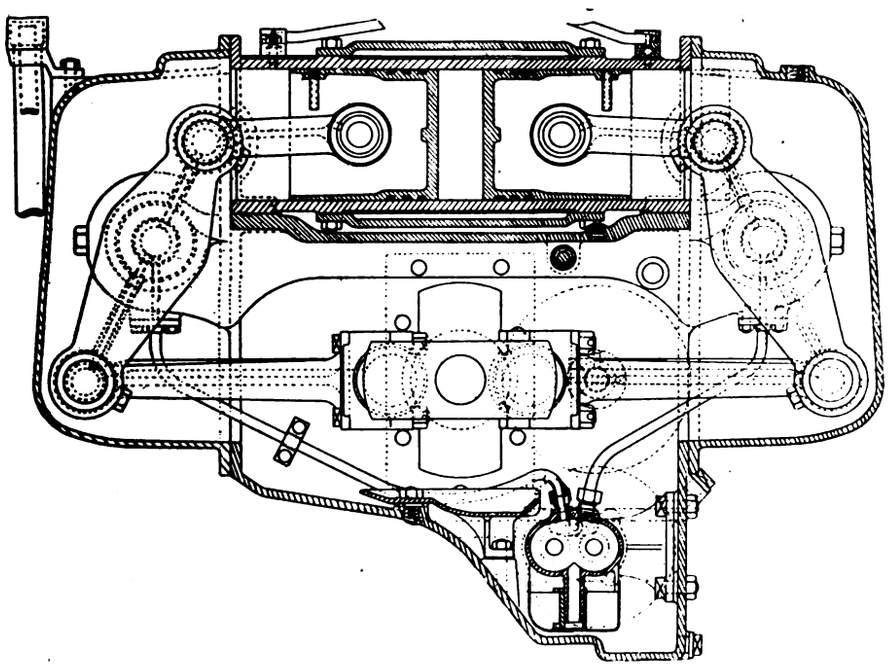
In case the plug is set in a collar which is screwed into the head a strip of thin metal may be cut in the form of a gasket, a tag being left at one side which is bent upward, and to which a couple of thin strips of metal, bent to form a suitable clip, are afterward riveted in the manner shown in the sketch. When the collar is screwed in place it holds the clip firmly in place and is sufficiently rigid for all practical purposes.

In case the plug is screwed into the head in the more ordinary manner it is possible to fix the clip under one of the studs which hold the couplings of the water connections or to some other part in the manner indicated.

One Cause of Clutch Slipping.

In the common type of leather faced cone clutch, it is not at all uncommon when the facing has become well worn for a ridge to be formed in the leather at the back end. This is caused by the action of engagement, which tends to force the upper surface of the leather backward, thus creating a little bead at the face of the flywheel. In the course of time this becomes so great that it prevents the clutch from being fully seated, and is responsible for a great deal of slipping. To obviate the difficulty it is only necessary to cut off the ridge, either by paring it away with a sharp knife or by filing it down with a rasp. Care should be exercised in doing this, to see that the surface is left parallel with the outer face of the flywheel, and not simply in line with the surface of the cone, as in this way all future trouble from the same source is done away with.

Mexico as a Market.



According to a recent consular report, Mexico presents an unusually good field for the sale of automobiles of moderate price. It is conservatively estimated that there are at present fully five hundred cars of different kinds in the Mexican capital, the majority being of American make. The cars in greatest demand are those which do not exceed $1,500 in price at retail. The import duty varies with the weight. Up to 550 pounds the rate is 12 cents per kilo (2 1-5 pounds); between the latter figure and 1,650 pounds the rate is 10 cents, while for anything over this limit it is 8 cents. As these figures are calculated in Mexican silver, which at the present rate of exchange is not worth quite 50 cents on the dollar as compared with American money, the import duty on cars not exceeding 2,000 pounds is less than $50.

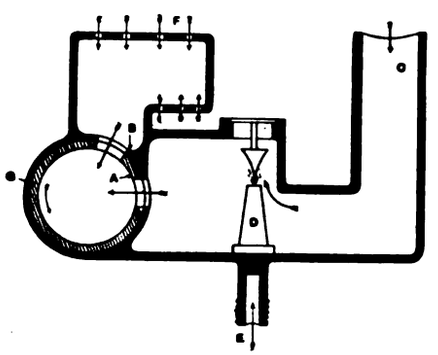
DOUBLE PISTONS UP AGAIN

Attention Attracted to Old Principle by Unexpected Performance in a Public Test.

It is, to say the least, somewhat of an anomaly that a car fitted with a type of engine generally looked upon as little better than a "freak" should carry off the honors in a race for touring cars, under the strict fuel limitation of which many cars of standard makes went down. This is the Arrol-Johnston, made in Scotland, one of which took first place in the recent English tourists' trophy competition held in the Isle of Man, and another gained fourth place out of something like fifty contestants, eighteen



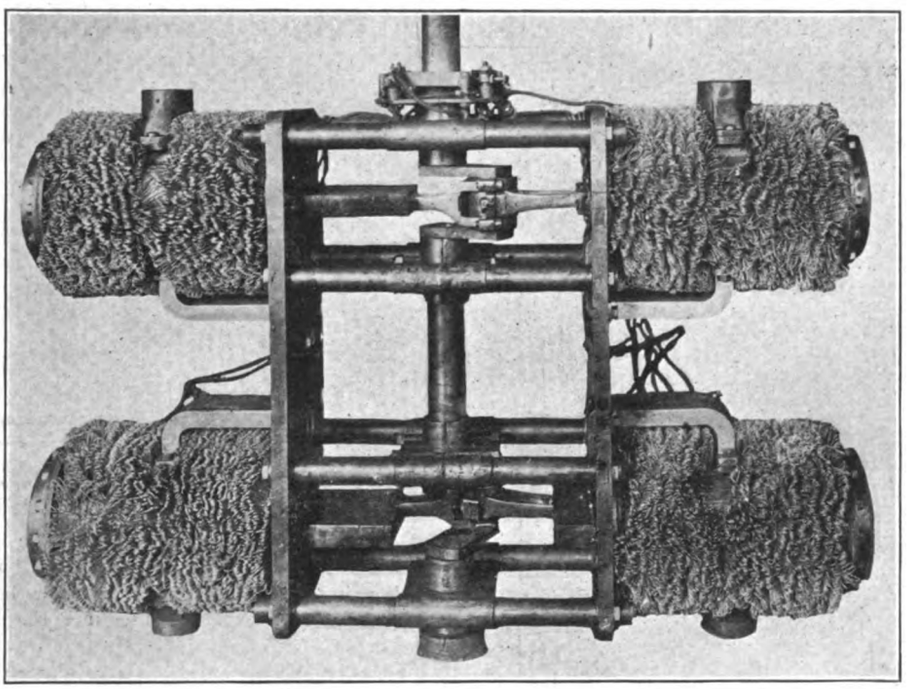
of whom qualified. This is not its only achievement, for in the Scottish reliability trials held some months ago it established the unprecedented record of 39 car miles and 43 ton miles per gallon of gasolene, in spite of being handicapped by small solid tires and a short wheel base on the type of car then built.

Concerning the cars entered in the last event, they do not, apart from the engine, differ much from current types. The motor is one that, possibly with a single exception, has never before been applied to cars regularly put on the market. Its principle is not new, as it was experimented with almost half a century ago, though not at that time developed beyond the experimental stage, so far as known. This was the Atkinson engine. Numerous experimenters have made use of the same principle with more or less modification since then, but it is not such as would appeal either to the average engineer or layman as possessing any decided advantage over the simpler and universally used single piston type. The only other car upon which it is known to have been used on a commercial scale is the Gobron-Brille, a French production, in which the engine is vertical. It is a type of which very little is known outside of engineering circles, so that a description of it will be found of interest.

In the case of the Arrol-Johnston car, the engine is set horizontally across the frame under the bonnet, with the four throw crank shaft directly beneath the two cylinders, the bore of which is 4¾ inches and the stroke 6½. There are two pistons in each cylinder, working in opposite directions, and, as will be noted from the accompanying sectional view, the explosion takes place between them, driving them apart, their movement being communicated by short rods to heavy rockers, which in turn, through the medium of connecting rods and cranks, convert it into a rotary motion at the shaft. The view in question is taken right from the end of the engine as it appears when mounted on the chassis, and thus only shows half of it, the entire mechanism shown being duplicated just behind it. Thus the engine has four pistons with but two cylinders, this arrangement with the cranks set at 180 degrees giving four impulses per revolution to the shaft. The pump shown in section in the lower right hand corner supplies the force feed lubrication.

Two cam shafts are employed, the gears for driving them being housed in the engine casing. Make and break ignition supplied by low tension magneto supplies this essential with the somewhat unusual feature of platinum tipped plugs and strikers. The inlet valves are automatic, and are placed directly over the exhaust valves, upon which a governor of the familiar hit and miss type long since discarded by designers of automobile motors acts by preventing it from opening. With a governor of this kind there is no graduation of speed, as once the limit is exceeded the tappet misses the exhaust valve stem and the latter remains closed. The cylinder being full of the burned gases of the last charge, there is but a weak tendency on the part of the inlet valve to open and no explosion follows. It is an economical method, and though coarse in its action, it can be set by hand to permit the engine not to exceed any speed from 200 to 1,100 r. p. m. At 800 revolutions the engine is rated at 18 horsepower. A gear driven pump supplemented by a fan formed of the flywheel spokes, which with the aid of a casing under the engine forces all the incoming air through the radiator, constitutes the cooling equipment.

A multiple disk clutch is employed, and, contrary to usual practice abroad, is not interconnected with the pedal or side brakes or with the engine control. Four speeds ahead controlled by a single short lever are provided, the range being 10 to 45 miles an hour. Transmission is by means of a propeller shaft, and in order to reduce the shock of the explosions a form of spring drive is



fitted close to the differential. The carburetter is also of special design, although embodying the principles recognized as being best fitted to give the result aimed at. The matter of their application will be clear from the sectional view given. It consists of the usual nozzle, the spray from which impinges against a cone, its chief feature lying in the method of supplying air. The main intake is at C, with an auxiliary at F, the relation between the two being governed by the rotary throttle G. When starting the engine the extra air port in the latter communicating with F is opposite the main port, so that a rich mixture is supplied. Rotation of this valve in the direction indicated by the arrow causes the amount taken by the engine to be decreased. At the same time the extra port opens and admits additional air until the maximum is reached, after which any further movement causes the extra air port and the main mixture port opening to be reduced, thus throttling the engine. When both ports in the valve pass the openings in the case there is a complete cut off, corresponding to the closed throttle on other carburetters. In the position shown, the throttle is fully open, so that the engine is not only receiving all the mixture the carburetter can deliver, but the latter is receiving the maximum supply of air. Further rotation in the same direction causes A to pass B, when pure air passes into the mixture chamber and so on to the engine from the extra air inlet. The ports are staggered with relation to the vertical, and one edge of the extra port is in the nature of a flap, thus insuring more gradual action and finer adjustment.

WHY FEW AIR SHIPS FLY

Design and Construction of This Motor Supplies One of the Reasons.

When every element that tends toward safety and reliabilitly in an engine is sacrificed for light weight, the result is not apt to be sound mechanically nor in any other sense of the word. But this is in effect what the average designer of a motor for aerial navigation does, particularly when he happens to be an individual to whom the attainment of aerial navigation is everything and the motor merely an incident. But for all that, he is neither content to acquire a motor to suit his purposes by buying it of some accredited maker, by far the most economical method in the end, nor, on the other hand, to take advantage of the principles evolved by gasolene engine designers after many years' study and practice, and must needs bring forth a genesis of internal combustion engine from the depths of his own inner consciousness.

Such is the creation illustrated by the accompanying photograph, which, while not so heavy that a boy of sixteen would have any trouble in lifting it, is rated at 20 horsepower. In appearance it differs about as radically from the general conception of what a gasolene motor should look like as it does in its other essentials. In none of the latter, except those moving parts common to all reciprocating engines, does it resemble anything usual in current practice. It is, in brief, a four cylinder horizontal opposed, two cycle, air cooled motor without any crank case. The cylinders, which are 3¼ inches internal diameter, are not only turned smooth on the outside in contrast with the ribs or flanges cast on the usual air cooler cylinder, but are closed at both ends in a manner very similar to a steam engine. To insure sufficient cooling surface the smooth cylinders are tightly wound with a mass of woven wire, which gives them much the appearance of being sections of a mattress out of place. The combustion chamber is formed by the outer end of the cylinder, the pistons having a stroke of 3½ inches. Each pair of cylinders is mounted on a common base, the latter in turn being tied together by tubing at eight different points, these tubes also providing a support for the bearings.

The mixture is admitted to the inner end of the cylinder, where it is compressed by the outward stroke of the piston and is sent around to the combustion chamber through the by-pass when the port in the side of the cylinder is uncovered at the end of the stroke. These by-passes are aluminum tube of rectangular section, and will be noticed on the inside face of the cylinders, almost covered by the woven wire. In order to maintain the compression in the dead end of the cylinder, to which the mixture is first admitted, without the necessity of adding cross heads and guides, the connecting rods are inclosed in aluminum cases, which move back and forth with them. Ignition is by means of jump spark, supplied by dry batteries and vibrator coil, the secondary current from which is led to the concealed plugs through the distributor shown on the main shaft. The flywheel, which does not appear in the illustration, consists of a discarded pulley, such as are employed in numbers for transmitting power by means of belts in shops. It is about twenty inches in diameter and weighs in the neighborhood of fifteen pounds. The total weight of the engine in running order is 125 pounds, and it is designed to run at the rate of 2,000 r. p. m.

DESIGNED FOR DESERT USE

Features of a Car Built Specially for Travel in the Sand of Soudan.

As the result of extensive experiments in the use of an automobile on the desert, a novel car has just been completed for the use of the Sirdar of Egypt, who will use it on the vast sandy stretches of the Soudan. The motive power consists of a 20 horsepower three cylinder vertical engine, with a Renold silent chain transmission. The wheels are entirely inclosed by light metal side plates, leaving nothing but the broad, solid rubber tires exposed, and it is thought that the latter will remove the difficulty of getting over the surface of loose, shifting sand without becoming embedded so deeply as to impede progress. To prevent the fine grit working into any part of the mechanism the entire underbody is protected by an ingeniously devised apron.

Either kerosene or gasolene suits the engine equally well, and owing to the character of the country to be traversed provision has specially been made for a three days' supply of cooling and drinking water, as well as fuel. The change speed gear gives a range of from three to twenty miles an hour. The car will in addition haul a two wheel trailer very similar to a gun carriage, upon which will be mounted a dynamo and searchlight to be run from the car engine. This will be used for night observations in the desert. Without the searchlight carriage, the weight of the car is close to five thousand pounds.

Night Test of Agricultural Motor.

Just by way of demonstration an English agricultural motor was recently put to work at night in a field brilliantly lighted by acetylene gas, and, drawing two six-foot mowers, cut fifteen acres in three hours and thirty-five minutes. The object was to show that the motor driven agricultural machine is as efficient and satisfactory at night as during the daytime—a fact which should be of considerable importance to the larger farmer in the harvesting season, when frequently there is the utmost need of haste, and when the getting in of the crops is often delayed by the limited endurance of the horse.

Misco Evolves a Wonder-Worker.

Another motive power revolutionizer in the shape of a gas engine, which is to develop an efficiency thrice that of the motors in common use, is the recent product of the brain of a Buffalo mechanical and metalurgical engineer, Joseph Misco by name. "These are days of mergers in the financial world," says a daily paper in laudation of the affair, "but a merger of the steam engine and the gas engine is a merger of physical forces which is typical of this age of combinations in the interest of economy." It ought to run after all that!

The Week's Patents.

800,151. Running Gear for Vehicles. William T. Hanna, Cincinnati, Ohio, assignor to Martha A. Hanna, Cincinnati, Ohio. Filed February 11, 1905. Serial No. 245,177.

Claim.—1. In a running gear for vehicles the combination of a frame consisting of longitudinal and transverse arms pivoted together at the corners, rigid frames swiveled to the ends of the movable frame, wheels journaled in the rigid frames, and means for changing the angles between the sides of the movable frame, substantially as shown and described.

800,164. Means for Loading and Unloading Motor Trucks. Thomas E. Morford and William V. Lowe, Worcester, Mass., assignors to Morgan Motor Co., Worcester, Mass., a corporation of Massachusetts. Filed March 8, 1902. Renewed April 14, 1905. Serial No. 255,654.

Claim.—1. In an apparatus of the class described, the combination of a motor truck, a crate or body therefor, a slip or way into which the truck may be run, and supports at the sides of the slip for engaging the crate or body, said supports and the surface on which the truck moves as it passes into said slip being relatively inclined to each other, whereby as the truck moves into position in said slip a crate or body will be unloaded therefrom.

800,165. Motor Truck and Means for Loading and Unloading the Same. Ralph L. Morgan, Worcester, Mass. Filed January 18, 1902. Renewed February 25, 1905. Serial No. 247,248.

Claim.—1. In an apparatus of the class described, the combination of a truck, a motor or engine for operating the same, loading and unloading fixtures mounted in position so that the truck may be run into place to co-operate therewith, and means for operating the loading and unloading devices from said motor or engine.

800,166. Motor Truck. Ralph L. Morgan, Worcester, Mass. Filed January 18, 1902. Renewed April 19, 1905. Serial No. 256,410

Claim.—In an automobile truck, adapted for carrying loads along ordinary streets or highways, the combination of a truck platform, the wheels supporting said platform, operating connections for the truck located beneath said platform and comprising an engine, a running gear and a shiftable connection for driving the running gearing at different speeds, a shaft turning with said engine, and having capstans at its ends at the side of the truck, and a jib-crane pivoted at the side of the truck-platform and arranged to swing over the truck platform to place loads thereon or remove them therefrom, and arranged to be operated from one of the capstans.

800,167. Motor Truck and Means for Loading and Unloading Same. Ralph L. Morgan, Worcester, Mass. Filed March 3, 1902. Renewed April 14, 1905. Serial No. 255,653.

Claim.—1. In an apparatus of the class described, the combination of a motor truck, a crate or body therefor, a lifting frame for supporting the crate or body so that the truck may be run into place beneath the same, with connections for the lifting frame operated by power from the motor truck.

800,191. Graphite-Lubricator. Carl W. Weiss, New York, N. Y. Filed December 12, 1904. Serial No. 236,438.

Claim.—1. A lubricating device adapted for use in connection with a chamber containing air or gas under pressure, in which the pressure of the air or gas is varied, comprising a receptacle for the dry graphite, connected with the interior of the chamber by a duct, the duct leading from the chamber to a point in the upper end of the receptacle, and terminating in a downwardly directed orifice through which orifice, on increase of pressure in the chamber, the air or gas currents enter the receptacle, and discharge downward on the graphite to cause it to float, and through which orifice, upon a decrease of pressure, the air or gas carrying floating graphite passes into the chamber.

800,268. Speed-Changing Mechanism. Conrad M. Conradson, Warren, Pa. Filed February 29, 1904. Serial No. 195,707.

Claim.—1. A speed-changing mechanism comprising in combination a gear-carrier; a driving and a driven shaft projecting therefrom; a gear upon each shaft; gearing carried by the gear-carrier and in mesh with the gears upon the shafts coupling the two shafts together and within said carrier; clutch mechanism between one of the shafts and the carrier; and cam and plunger actuated mechanism for actuating said clutch for holding the axis of rotation of such gearing and for changing the same from a fixed axis of rotation to a translationally-movable axis, and vice versa, and in both of which axial conditions all the gearing is at work.

800,273. Transmission-Gearing. Orson W. Davis, Adrian, Mich. Filed July 19, 1905. Serial No. 270,313.

Claim.—1. In a frictional transmission-

gearing, the combination of the engine shaft, a flywheel fixed thereon, having a straight face, the driven shaft in line with and rotatable independently of the engine shaft, a band clutch to directly connect the driven shaft with the engine shaft, a friction disk slidable on the driven shaft and rotatable therewith, opposed friction wheels having straight faces adapted to engage the periphery of the friction disk, and having straight peripheries adapted to engage the straight face of the flywheel.

800,281. Automobile Ice Harvester. William Esch, sr., Chicago, Ill. Filed January 16, 1905. Serial No. 241,398.

Claim.—1. In a machine of the class described, a suitable frame, two propelling wheels mounted on a propelling shaft near one end of said frame, steering wheels mounted near the other end of said frame, a motor mounted on said frame, arranged to rotate a drive shaft mounted on said frame, a gear controlled by a friction clutch mounted on said drive shaft meshing with a gear secured to a counter shaft mounted on said frame, a vertically swinging frame pivoted on said counter shaft, a cutter rotatably mounted on the free end of said swinging frame, a sprocket secured to said cutter, a sprocket secured to said countershaft and a chain connecting said two sprockets, two bevel gears controlled by independent friction clutches mounted on said drive shaft, meshing with a bevel gear connected by chain and sprockets to said propelling shaft, means for raising and lowering the free end of said swinging frame and means for controlling the steering wheels.

800,290. Explosive Engine Starter. Emanuel J. Grace, Erie, Pa. Filed May 2, 1904. Serial No. 205,940.

Claim.—1. In a device for preventing backfiring action in explosive engine starters, the combination with the engine shaft and starting lever; of a clutch mechanism comprising a key sleeve connected with the starting lever and having a key pocket therein; a key in said pocket; a retaining sleeve adapted to normally hold said key in a position protruding from the opposite surface of the key sleeve, and being provided with a recess into which said key may move when a backward movement of the shaft occurs; and a shaft part having a recess into which said key is normally forced by the retaining sleeve.

800,307. Vehicle Tire. Albert de Laski and Peter D. Thropp, Trenton, N. J. Filed July 11, 1903. Serial No. 165,097.

Claim.—1. A tire consisting of a circular woven tubular fabric having its ends suitably secured together, threads applied to the exterior of the circular woven tubular fabric, a tread exterior to the threads, an interior inflatable tube and an anti-elongating strip within the circular woven tubular fabric.

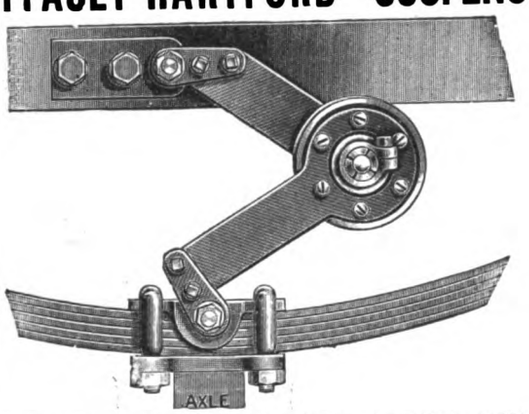
800,308. Vehicle Tire. Albert de Laski, Peter D. Thropp and Henry Deck, Trenton, N. J. Filed December 18, 1903. Serial No. 185,629.

Claim.—1. The combination with a clincher tire having the opposite faces of its base portion inclined and soft-rubber ring applied to said inclined surfaces of a wedge-shaped annular ring of harder rubber engaged with the soft rubber annular ring for holding the latter in snug contact with the inclined faces of the base portion of the tire and means for holding the tire in position.

800,357. Vehicle Tire. Floyd Burnham. Fresno, Cal. Filed December 20, 1904. Serial No. 237,640.

Claim.—1. An improved tire composed of an outer tubular casing having relatively thin walls of substantially uniform thickness and forming an inner chamber which is concentric with the exterior of the tube, and a multistrand rope filling said inner chamber and supporting the walls of the casing.

800,366. Vehicle Tire. Charles W. Faitoute, Summit, N. J. Filed August 11, 1904. Serial No. 220,324.



Claim.—1. The combination with a vehicle tire, a band of flexible gripping material extending around the circumference of the wheel rim between the rim and tire forming a cushion for said tire, a cup shaped washer having a continuous lower edge and held by a suitable fastening clamping said band between said washer and rim, substantially as described.

800,372. Sparking-Igniter-Starting Mechanism for Gasolene Engines. Andrew J. Haskell, West Bethel, Me. Filed November 25, 1903. Serial No. 182,571.

Claim.—1. In an igniter starting attachment for gas or gasolene engines, the combination of a hammer blow igniting mechanism, a lay-shaft actuated by the engine, a cam on said lay shaft adapted to operate the inlet valve of said engine, a latching member pivoted at one end and adapted to be engaged by said cam and to engage with the hammer-blow igniting mechanism and hold it so that when released it will act to create a spark, and means carried by the latching member for varying the time of action of said member.

to

SOLVE THE IGNITION PROBLEM.

Not our claims but

TESTS
and
TESTIMONY

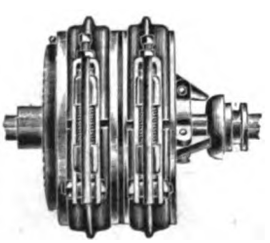
such as this prove how thorough is the solution:

The Cobleigh Motor Vehicle Corporation
New Britain, Conn August 20, 1906.

Witherbee Igniter Co.,
27 Thames St.,
New York City.

Gentlemen:-

I am pleased to advise you that in the six-day, non-stop contest held at Long Branch last week and in which I drove a Cobleigh 16 H.P., Model D car, there was used one only four Witherbee battery which worked perfectly, the entire week and is working perfectly now although the car has run a considerable number of miles since the closing of the contest. I have just tested the battery and find that each cell now shows 1.9 volts. The mileage made in this contest was 2241.4 and the car has a number of miles before and since that time. I sincerely think that this is a most creditable showing for any make of storage battery and am pleased to testify to the extreme satisfaction which your battery gave me in this instance.



Very truly yours,

L.H.

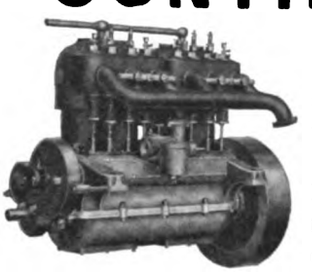
HILL PRECISION OILERS.

September 14, 1905.

THE STEEL BALL COMPANY,
840 Austin Avenue, Chicago, Ill.

Gentlemen:—In reply to your favor of the 12th inst., would say that Mr. Alexander Winton has always recognized lubrication as one of the most important problems to be solved by automobile manufacturers.



It is safe to assume that the Winton Motor Carriage Company has devoted more time and experimenting to this feature than any other automobile manufacturing company in the country

For more than a year the Hill Precision Oiler has been subjected by Mr. Winton to the most exhaustive tests, both in our experimental department and also in exceedingly severe and prolonged road work. The most satisfactory results have been obtained, and as a result, believing it to be the most perfectly developed lubricating device yet produced. Winton cars will be equipped during the coming season with the Hill Precision Oiler.

Yours very truly,
THE WINTON MOTOR CARRIAGE CO.

There are reasons why

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

Reason 1
TOUGHNESS.

¶ MORGAN & WRIGHT cover stock is made from a compound which twenty years of tire-making has proven beyond any question to be as near invulnerable as rubber can be made and retain its rubber efficiency.

¶ It has been cut by glass, and nails have gotten thru it, but week in and week out the remarkably small number of such injuries is conclusive evidence that this stock possesses an almost incredible amount of toughness.

¶ All of which is but one good feature in a thoroly good tire.

Business and the OLDSMOBILE

As a business man, when you decide to buy an automobile, you naturally turn to the trim, ever-ready runabout, whose popularity among business men has won it the title of "An Office on Wheels."

It has been found that for daily use about town or even for runs into the country, the standard runabout, with its 7 h. p. single cylinder motor is the most economical to operate and gives the most efficient service.

Traveling men have adopted it both for city service and, in a number of instances, for covering territory made up of small towns in well settled sections. For example, in Southern Michigan and Northern Ohio one man has used an Oldsmobile runabout for the past three seasons in visiting 225 towns, driving in so doing 8000 miles each season.

Others have had equally satisfactory experience.

Send for Catalogue 53, giving complete particulars of our line.

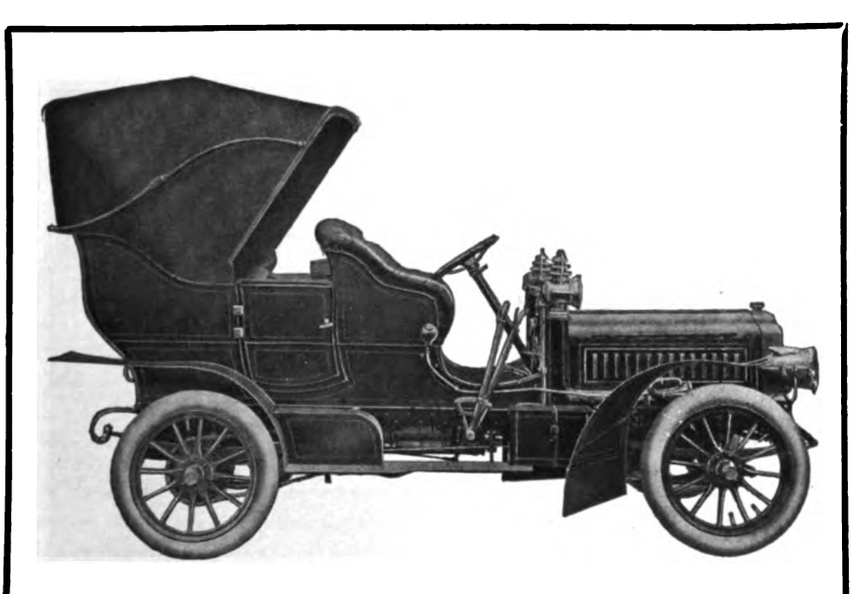
DON'T EXPERIMENT
Just Sell
THE FORD

Mr. Agent:—Over 2,000 Automobile buyers decided during the past season not to experiment. They all bought "Fords." It is even more important for the retailer to *sell* a car of known merit than it is for the purchaser to *buy* one. The buyer only loses his *money*, but the agent who sells a car not up to standard loses both *prestige* and *reputation*.

The success of the Ford Motor Co. is built on the success of the Ford Cars, and you know how great our success has been. Remember that people like to do business with successful firms, and a *car with a reputation is easier to sell than an unknown.*



You know the general rush to the Ford exhibit at the shows, and how they all ask, *"What has Ford this year?"* plainly indicating that automobile men look to Henry Ford for new ideas and originality of design.

We have a surprise or two up our sleeve this year—particulars about October 15th—nothing before, except that there is certainly good business ahead for the Ford agent in 1906, and it might be well to write us and see if we can give you the proposition and the territory you require.

E. R. THOMAS MOTOR CO.,
Buffalo, N. Y.

Gentlemen:—Last October I purchased a 24 horse power Thomas Flyer from a Boston owner, who told me that it had been driven 10,000 miles during 1904. Since owning this car I have covered 21,000 miles in it personally, getting over $1700.00 from renting the same, and the machine seems smoother running to-day than ever.

I have carried six and seven people in it many times on trips forty and fifty miles. Better service could not be asked or given.

Yours very truly,
WM. E. TANNER.

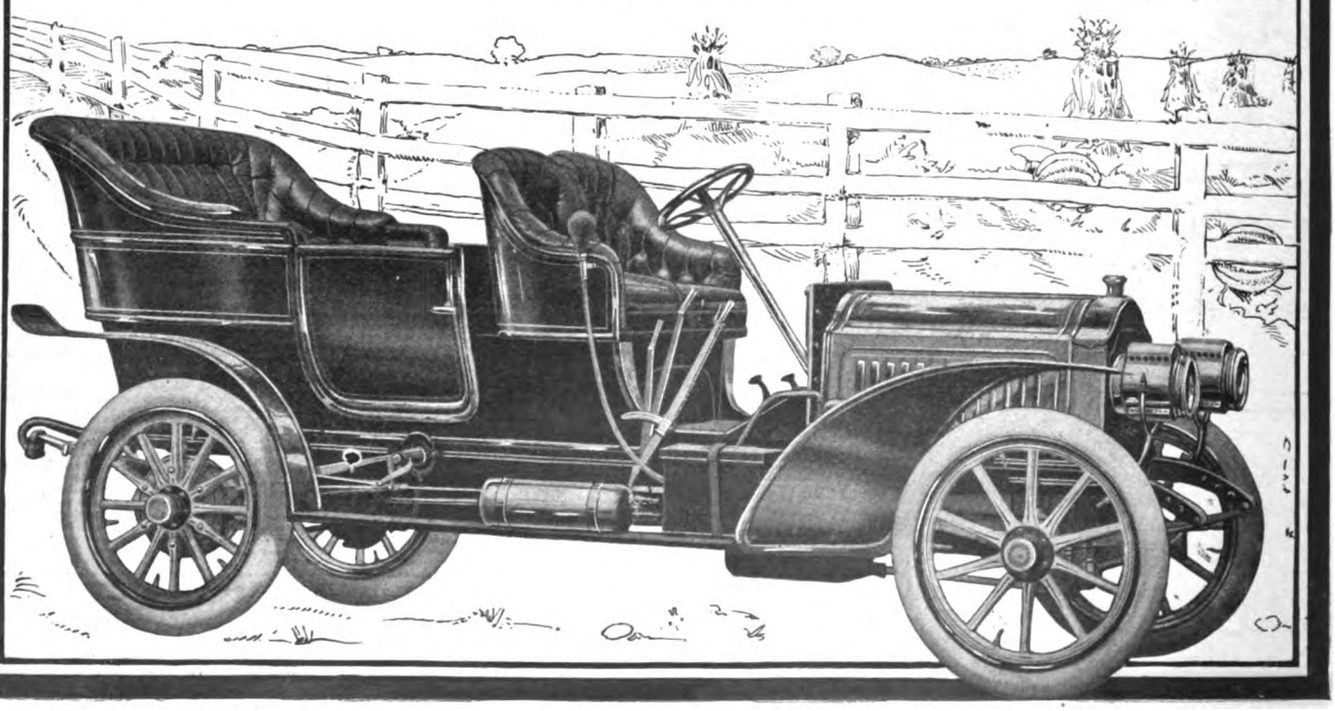
Packard

The car that has been consistently successful in the past can be depended upon to be more successful in the future.

Each successive model has added to the Packard record for endurance and reliability and that unequaled smoothness of running.

The latest model, the New Packard 24, upon which will be concentrated every thought and every facility of the Packard factory during the coming season, has already proven itself to be the best thing we have ever turned out. On June 8th, the first car of this model made the run of three hundred miles from Detroit to Chicago in the total elapsed time of 12½ hours, running time 11 hours, carrying five to six passengers. After a night's rest in Chicago the car made the return journey on the following day, June 9th. This severe test of six hundred miles was made without repairs or replacement except to tires.



Price with Standard Equipment, $4,000.00, f. o. b. Detroit. For our catalog and name of nearest Packard dealer, address

Will you write us about the

1906 Agency for the WAYNE?

The Wayne Agency for 1906 is a good thing. The Wayne cars were extensively advertised last year in all the leading magazines and trade papers. For 1906 we have made arrangements for a campaign of co-operation with our local Agents which will mean practical assistance in selling Wayne cars. We realize that to get good Agents it is necessary for the Agent to have a proposition on which he can make money, and the Wayne agency proposition is one which it will pay you to investigate.

The Wayne line for 1906 is comprised of cars that have proved their ability to stand hard usage by three years road service.

We have not changed the Wayne principle of construction because nobody has yet been able to show us anything better tho' our cars contain all new improvements and are strictly up-to-date (no old models built over.)

Write us and find out what we have to offer, before you forget.

WAYNE AUTOMOBILE COMPANY, Dept. Q. Detroit, Mich.

PERFECTLY SIMPLE
SIMPLY
PERFECT

16 H. P. Touring Car
$1,400

8 H. P. Tourabout
$750

THE CAR that made a perfect score in the Glidden Tour—1,004 miles without a single adjustment. No car at less than twice the price made **AS GOOD** a record. No car **AT ANY PRICE** did better.

THE CAR that won a victory over all cars costing from one to two thousand dollars in the "Climb to the Clouds" at Mt. Washington. Unlike some contestants, we did not have to send three cars to get one up, but sent the **SAME** car up **THREE TIMES.**

THE CAR whose regular stock 8 H. P. Runabout type won the race at Long Branch August 19, making four miles in 5 min. 33 sec., and defeating cars listed at several times the price.

The automobile that has done these things **MUST** be worthy of your consideration. Look at as many cars as you please, but don't buy before seeing the Maxwell.

The agency field is filling fast. If you contemplate applying for a Maxwell agency, better do it now.

Mr. C. E. Miller,
#96 Reade Str.,
New York.

Dear Sir:-

I wish to write you regarding the Brampton chains which I purchased for my Franklin car.

No. 1 I have used all the time and have given it about as hard a pull as it is possible for a chain to receive. All over the mountains of Orange County, New York, and between New York, Philadelphia and Lakewood until I am tired of the road.

The long chain on the Franklin is a pretty stiff proposition and many, in fact, most of my friends state that their first trouble on that car is that chain breaks and I have met people who have worked for hours to get their chain fixed on the road, but I have never met a Brampton in trouble and mine so far has not a scratch on it.

No. 2 is in the paper in which your salesman wrapped it for me, and is resting in the bottom of the car waiting for No. 1 to break.

My partner, Mr. Wilmarth, President of the L. I. Automobile Club, has a Brampton on his Winton and has had practically the same result as myself. He got me in line for the Brampton and there I stay.

Very truly yours,

Dict.
H. S. M. - G.

Henry S. Morris

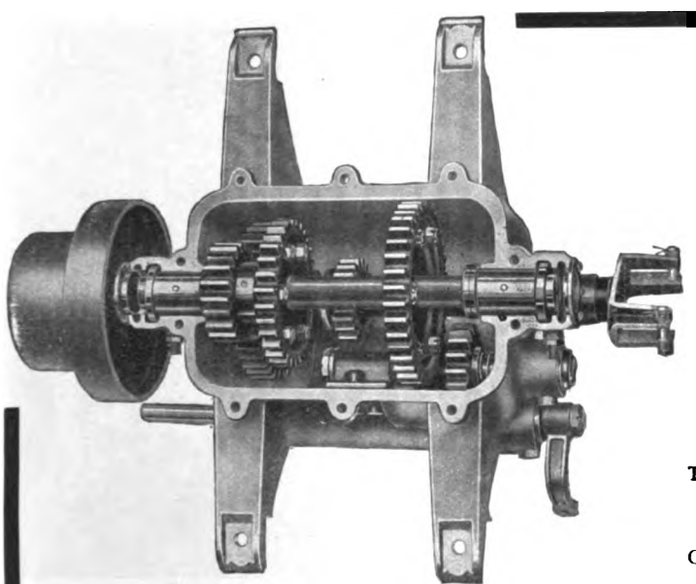
"Firestone"

SIDE-WIRE TIRES

are used on nine-tenths of the American made commercial vehicles. Why? Because manufacturers of commercial automobiles have learned by hard experience that the "Firestone" is the only tire that will withstand the hard knocks that are inseparable from commercial machines.

Firestone Tires wear like iron. They hold to the Rim—they give satisfaction.



Then why not "Firestone"?

GARFORD TOURING CAR PARTS

The great problem of the hour for the automobile manufacturer is to develop the details of his engine. This study is so absorbing and important that the duty of producing axles and other parts has been left to other specialists.

Our specialty is the manufacture of parts for the very highest class of cars—parts that are as good as life insurance. We make:

REAR AXLE, Independent Shaft Drive, Ball or Plain Bearing, Weight Carried Entirely on Axle Tube
FRONT AXLE, I-Beam Section Nickel Steel Bed, Ball or Plain Bearing
CHANGE GEAR STEERING GEAR CLUTCH
DISTANCE ROD AND BRACKET PROPELLER SHAFT LEVERS FOR EMERGENCY-BRAKE AND CHANGE-GEAR

Parts of one size are suitable for cars weighing up to 2400 lbs. and of 30 H. P.
Parts of the other size are suitable for cars weighing up to 2800 lbs. and of 50 H. P.

Write for Circular No. 12.

Exceptional Opportunity to Purchase a BARGAIN.

Several cars used for demonstrating purposes at our factory, branches and agencies, are offered at alluring prices—if sold—**quick**. Choice of our different models is given.

These cars are perfect in every respect, but cannot truthfully be called brand new cars. Quick action on the part of an intending purchaser will result in a big bargain, coupled with the lasting satisfaction for which the "Haynes" is famous.

Write us at once.

Rambler

Low Cost of Maintenance, Reliability and Splendid Appearance Makes This The Favorite Car—The All Around Car.

When it is considered that the Rambler has, in contests with other cars, demonstrated its ability to travel the same distance in equal time, consuming 40 to 50% less fuel and half as much lubricant without injury to the engine nor special effort on the part of the operator, it is not to be wondered at that so many of these cars were sold during the past season.

The sale of Surrey, Type One, will be continued in 1906 and with the improvements and refinements that have been made in this model, the demand for it at the reduced price will probably exceed the supply.

A number of these cars are ready for prompt delivery with complete equipment of lamps, horn, tools, etc., at

$1200

Cape Top, $100 extra
Canopy Top with glass front, $100 extra

We have representatives in all leading cities. Better call and ask for a copy of the Rambler magazine and a practical road test of Surrey, Type One. They are both free.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, October 12, 1905. No 3

WHY NO TRADE TICKETS

Reasons That Induced the License Association's Surprising Reform in Show Affairs.

Of the several radical reforms in show practices which will be brought to bear by the Association of Licensed Automobile Manufacturers at the Madison Square Garden exhibition in January, none has caused more comment and head shaking than the abolishment of the so-called "trade tickets" and coupon books of admission.

The ban placed on horn tooting, souvenir distributing and "sold" signs appear to have met with fairly general approbation, but the elimination of the reduced price "trade ticket" has excited universal wonder; prophecies that it will prove to be "a big mistake" are not lacking. However that may be, it is certain that none identified with the A. L. A. M. is greatly concerned over any possible or probable effects of their action.

"When our show committee recommended the abolishment of trade tickets," said a "man in the know' when a Motor World representative sought for the reasons that inspired such a far reaching reform, "there was as much surprise expressed and as much dubious eye lifting inside the association as is now in evidence outside of it. But when the committee gave the reasons for its proposal, I don't mind telling you that it was heartily and unanimously indorsed.

"The fact of the matter is—and nearly every one knows it—these trade tickets are simply thrown around. They are given to every Tom, Dick and Harry, and their sisters and their aunts. They are passed over the bar, they are handed to the barbers, the manicure and massage artists, the hotel bellhops and a lot more of such people who have no more interest in automobiles than they have in the creed of Confucius. It is of no benefit to the show or to automobiling to have them there.

"There was one other very good and sufficient reason that actuated the decision to abolish that form of admission: For the last show in the Garden there were sold some thirty thousand 'trade tickets,' of which number it was found that eight thousand were never used—in other words, the trade paid out $2,000 which might as well have been thrown into the gutter. When these facts were presented to the members the action of the show committee was, as I have said, immediately and heartily indorsed."

Foss and Hughes Join Forces.

W. J. Foss and Archie Hughes, managers, respectively, of the Pope Mfg. Co.'s branches in Boston and Providence, have resigned their positions, and, joining hands, are making ready to enter the business on their own account in Philadelphia. They already may be said to have made a good start, having secured the representation of two splendid lines—the Pierce and the Cadillac.

Accessory Men Appoint Allotment Committee.

The Motor and Accessory Manufacturers have constituted H. W. Chapin, H. E. Raymond, J. W. Gilson, D. J. Post and Peter Steenstrup their committee on allotment of show space. They will meet the managements of the New York and Chicago shows in this city on Thursday and Friday of this week, and will make the actual allotments early next month.

Shiland Becomes Sales Manager.

H. C. Shiland, former manager of the Chicago branch of the Buick Automobile Co., has been transferred to the main office at Jackson, Mich., where he will enter upon his new duties as general sales manager. W. J. Mead, formerly identified with the Monarch Cycle Mfg. Co., succeeds Mr. Shiland in Chicago. Shiland succeeds Charles Van Horne.

Randolph Takes on Lamps.

In addition to the Autocar, S. F. Randolph, who now has the new Autocar Co. of New York in going order at Broadway and Sixty-third street, has secured another good account—the Eastern agency for the Neverout lamps. A full stock of the lamps will be carried, as the Neverout people will discontinue their New York branch.

Kaestner in Financial Straits.

The Charles Kaestner Mfg. Co., South Bend, Ind., makers of several automobile accessories, are in trouble. A receiver has been applied for as the best way to get them out of it.

TO LESSEN TIRE UP-KEEP

How, if Manufacturers Won't Use Larger Wheels, Owners May Help Themselves.

"If automobile manufacturers would use larger wheels on their cars and automobile users would keep their tires fully inflated, very much less would be heard of tire troubles and tire maintenance," ventured an old tire man a day or two since. "Even the same diameter of tire on a wheel of greater size makes a big difference, but as nothing of the sort is on the immediate horizon, 'keep your tires well inflated' should be dinned into the ears of automobilists until there is no escaping it.

"The use of a soft tire is simply a premium on its disintegration. Compression itself implies friction, and when compressed air is kept circulating in a tire it means more friction. Friction means heat, and heat is destructive to both rubber and fabric, and there you are! When a tire is not well inflated, every bump—in fact, every revolution of the wheel that depresses the tire—sends the air shooting more or less violently around in its inclosing envelop of rubber, thereby greatly increasing the friction and the heat.

"If any one doubts the destructive effects of this sort of thing, let him experiment with a tire that is deflated to just such an extent that the inner tube will not be 'chewed up' by the abuse to which it is to be subjected. After such a tire has been given hard use, it will be found that the friction and heat generated is sufficient actually to melt the rubber; the inner tube will be found sticking together.

"'Let automobilists keep their tires well inflated, and they will save quite a few dollars in the course of a season. There's nothing so cheap as air."

Plumb Succumbs to Pneumonia.

Theodore W. Plumb, the general travelling representative of the Parrish & Bingham Company, Cleveland, and who enjoyed a wide acquaintance in the trade, died of pneumonia in that city on Monday last. His remains will be interred to-day at his old home, Meriden, Conn.

Falcon Swoops Down on Bay City.

W. F. Flynn is a young man who firmly believes in judicious advertising. Flynn is the Michigan lad who invented the "Falcon motor car, simple in construction, silent and marvellously swift in operation. The motor indicates a power heretofore believed impossible of attainment in an engine of this size and weight, which permits the running gear of the machine to be constructed on heavier lines in order to overcome the severe shock incidental to fast driving. In addition to this feature there are a number of special features found in no other machine." Flynn wants to locate in Bay City, Mich., and as paid advertising requires considerable outlay, Flynn decided to take a lot of newspaper reporters for an outing. The result is very apparent, for in commenting editorially on Mr. Flynn's intended stock company a Bay City paper says: "Any one having money to invest in a legitimate industry which promises reasonably large returns from the outset will certainly find it to their advantage to confer with the secretary of the Board of Trade. Bay City should certainly leave no stone unturned to secure this industry."

To Make Tops and Bodies.

The Barndt-Johnson Automobile Supply Co. is the style of a new industry at Columbus, Ohio, which has just been incorporated with a capital of $25,000. The company has leased a disused plant on East Donaldson street, where, as soon as necessary alterations are made, it will begin the manufacture of automobile bodies and tops. The company thinks it will have business enough to start with, as it has already contracted to furnish the Oscar Lear Automobile Co. with all its bodies for one year. These officers have been chosen: President, C. Chris. Born; vice-president, W. E. Johnson; treasurer, Lewis Ph. Hoster; secretary and general manager, Charles Barndt; directors, the officers and Thomas E. Curtin. Johnson was for years foreman of the body department of the Columbus Buggy Co., and Barndt was chief draughtsman for the same company.

Suits Follow Order for Special Car.

Frank C. Goddard and Henry W. Howe have filed answers in the Court of Common Pleas to the suit brought against them by the Williams Foundry & Machine Co., Akron, Ohio. The suit is to compel Goddard to pay for an automobile which the company claims it built for him under contract. Goddard alleges that the company in May, 1903, undertook to construct a car for him, representing that it would be completed within three months, the cost of which was to have been between $500 and $600. He claims that the machine was not completed by May 1, 1904, and is practically useless. In a cross petition Goddard alleges that he paid the Williams company $497.02, and that because of its failure to complete the car within the stated time he has been damaged to the extent of $500.

Will Sell Cars and Make Tops.

The King Mfg. & Garage Co., Springfield, Ohio, which has been incorporated with $20,000 capital, succeeds the King Mfg. Co., which concern made automobile tops exclusively. The new company will conduct a general agency and garage business, having taken the agency in Clark, Champaign and Green for the Pope-Toledo, Packard, Cadillac, Autocar and others. A garage is being fitted up on Main street.

Morrison Gets the Ranier.

The Ranier car is about to make its debut in Boston. The agency for it has been obtained by the Morrison-Tyler Motor Co., the new concern which A. E. Morrison, former manager of the Peerless branch, has organized in that city. It had been reported that the Harry Fosdick Co. had secured the Boston agency for the Ramier, but this has proved to be not the case.

New Managers for Locomobile Branches.

The Locomobile branches in Chicago and Philadelphia are in charge of new managers—A. J. Banta and Irving J. Morse, respectively. They succeed B. G. Sykes and William Morgan. Banta was one of tht Locomobile Company's most energetic travellers, while Morse has long been identified with the company, at one time having been connected with their London depot.

French Finally Locates in Clifton.

At last has the French Automobile Co., the $100,000 Maine corporation, located itself. It will begin the manufacture of "runabouts, touring cars, jobbing trucks and marine gas engines" in Clinton, Mass., in the factory building on Main street owned by Drs. W. P. Bowers and C. L. French.

Covert May Move to Rochester.

Indications are that the Covert Motor Vehicle Co., of Lockport, N. Y., will remove to Rochester soon. Most of the stockholders of the firm live in the latter city, and for some time have been desirous of bringing the plant there.

Hinckley Gets Foss's Place.

Freeman Hinckley has succeeded to the management of the Pope Mfg. Co.'s Boston branch left vacant by the resignation of W. J. Foss. Hinckley was previously assistant manager of the place.

Phelps Out, Name Changed.

The withdrawal of Mr. Phelps from the Phelps Motor Vehicle Co., Stoneham, Mass., has led to a change of name. It is now the Courier Motor Co.

Upton Becomes the Beverly.

The Upton Machine Co., Beverly, Mass., who manufacture the Beverly car and the Upton gear, have changed their name to the Beverly Mfg. Co.

Stanley Would Appeal to the Poor.

Many statesmen, orators, playwrights, authors and other classes of men prominent in the public eye have come from Indiana, but until lately no record of an Indiana philanthropist has been kept. Now, however, that State claims to possess a man who is a philanthropist and inuventor as well. He is James Stanley, of Mooreland, who "has perfected an automobile which, Mr. Stanley is firmly convinced, will prove a boon to the poorer classes." Quite unselfish in his ambitions, Mr. Stanley is endeavoring to form a stock company to supply the poorer people with automobiles at $350 per—or less. No doubt the most worthy of the poor will be allowed to purchase a block of the stock.

Big Garage for Baltimore.

Howard W. Gill and Stanley Zell, as the Motor Car Co., of Baltimore, Md., have purchased the lot at the northeast corner of Mount Royal and Maryland avenues, and upon it will erect a garage, which, when completed, will be the largest in the Monumental City. The estimated cost is $100,000. The building will be of concrete and brick, two stories high, with 150 feet frontage on Mount Royal avenue and 160 feet on Maryland avenue. There will be four entrances. The machine shop and storeroom will be on the first floor, the latter with a capacity for 150 cars. The Automobile Club of Maryland will have its quarters on the second floor, and on which also dormitories for chauffeurs will be provided.

Bates's Offer to Madison.

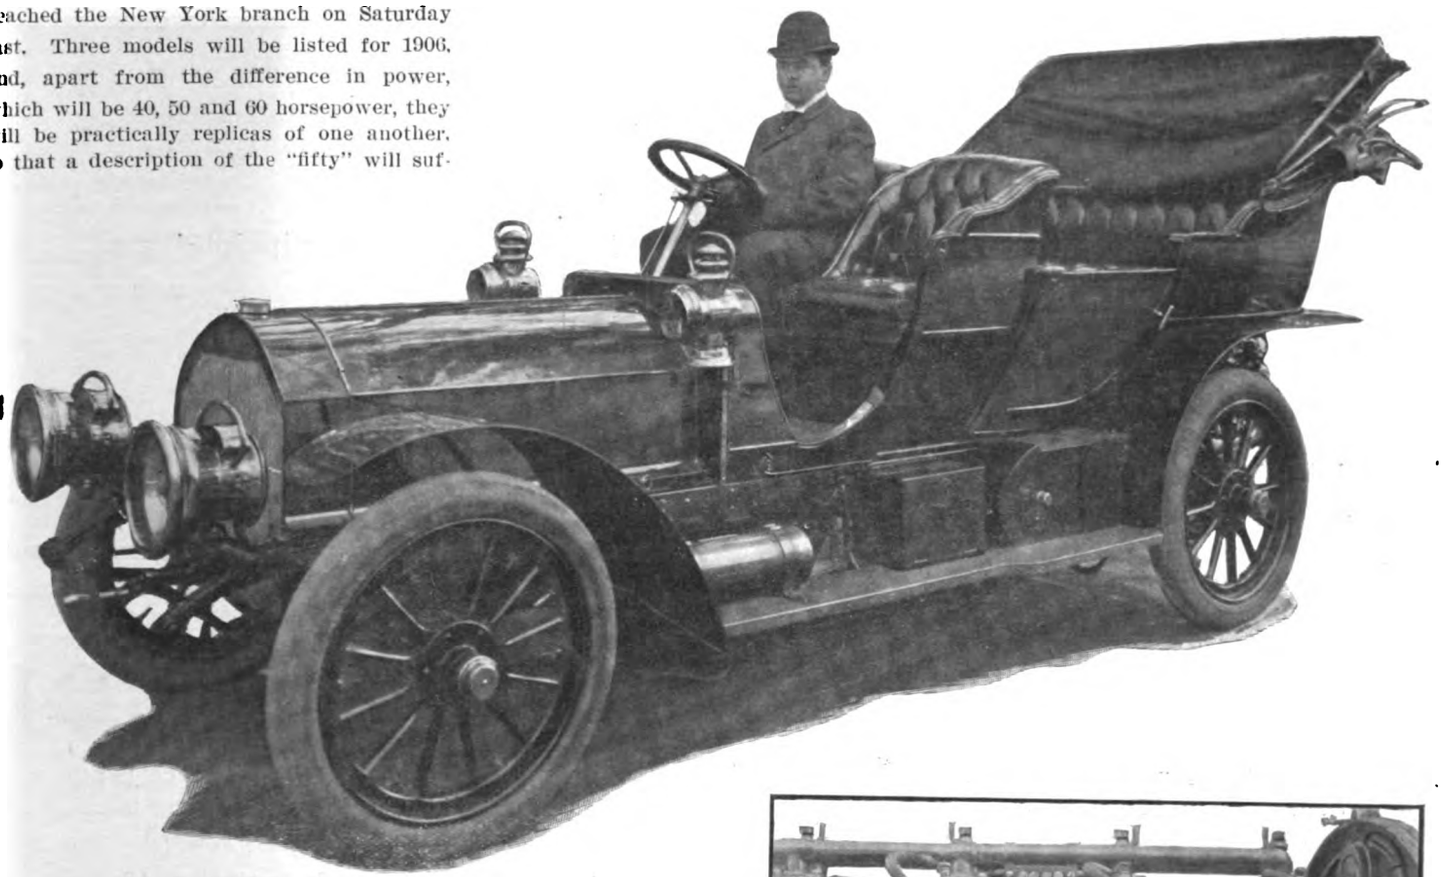
Apparently the report that the Bates Automobile Co., of Lansing, Mich., would remove its plant to Madison, Wis., was too previous. It appears that the matter has not passed beyond J. S. Crosby, a professional promoter, who is still in communication with the "40,000 Club" of Madison. All the Madisonians will have to do to secure the Bates industry is to subscribe for $161,000 worth of the capital stock of $250,000.

Kilgore Removes to Boston.

The Kilgore Automobile Air Cushion Co. has removed its office from Buffalo, N. Y., to No. 46 Columbus avenue, Boston, Mass. The device was being manufactured in the latter city, and the removal is therefore a natural one. S. F. Heath, former sales manager of the E. R. Thomas Motor Co., who was interested in the Kilgore company, has taken directing charge of its affairs.

Treasurer Goes to Factory.

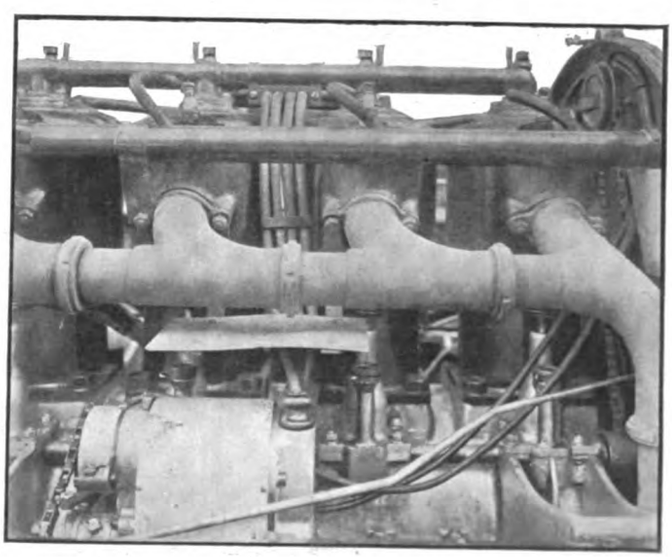
The auditing department of the Locomobile Company of America has been transferred from the New York branch to the factory at Bridgeport. The move, of course, carries with it Thomas M. Thomas, the treasurer of the company.



J. D. Anderson, vice-president of the Hartford Rubber Works Co., left last week on a flying visit to the Pacific Coast.

Digitized by Google

ABOUT THE NEW APPERSONS



First of them Reaches New York and Discloses a Number of New Features.

Long, graceful and easy lines characterize the 1906 model of the Apperson car, which is further made particularly distinctive in appearance by the addition of an attractive maroon finish, well set off by faint shading in the striping. The first of the new cars reached the New York branch on Saturday last. Three models will be listed for 1906, and, apart from the difference in power, which will be 40, 50 and 60 horsepower, they will be practically replicas of one another, so that a description of the "fifty" will suffice to give an idea of the features that will be uppermost in the product of this concern for the coming year.

The wheel base has been lengthened to 116 inches, making particularly easy riding, while roller bearings are now used on all wheels. Four-inch tires are used on the front and 4½-inch on the rear wheels. Spring dimensions have been increased in proportion. Coming to the engine itself, this in the new model is characterized by the addition of an exhaust made of telescoping joints and unions to permit of expansion as the piping grows hot and renders dismantling of the exhaust of one cylinder easy without disturbing that of all the rest. Apart from this and the adoption of the La Coste magneto driven from the cam shaft by chain and sprocket, last year's engine was found to be so satisfactory in service that few changes were considered necessary. The cylinder dimensions of the "fifty" are 5½ inches "square"—that is, both bore and stroke are the same—and the rated output is developed at a moderate speed. No modifications were deemed necessary to the automatic carburetter adopted last year, flexibility of engine speed being attained to a degree that renders gear changing rare, the direct drive being used even in heavy traffic. Considerable attention has been centred upon making every part of the mechanism easy to get at, and the majority of the few changes in the matter of detail that have been carried out in the power plant of the new model have been with a view to greater accessibility. The pump is now located directly on the end of the cam shaft, instead of being gear driven, as in last year's model, and the crank case is so arranged that an inspection of the cranks and shaft is but the work of a moment. A set of accumulators with four vibrator coils are added as a reserve to the ignition, the distributor for this end of the system, driven by chain and sprocket, being located on the dash. The wiring of the two systems is so arranged that either or both may be used at once. Ordinarily the car is started from the seat on the battery and then switched over to the high tension magneto.

Ample seating capacity for five persons, with plenty of leg room for all, is provided in the tonneau, the lines of which are in keeping with the sightly and somewhat rakish effect given the car by the use of a bonnet longer than usually employed. With top the fifty horsepower model lists at $5,500. The "forty" at $4,500, and the sixty between $6,000 and $7,000.

APPERSON TELESCOPIC EXHAUST JOINTS.

The Constructive Principle of Fisk Tires Involves

A Technique So Simple in Manipulation and So Positively Accident-Proof

that it should readily appeal to any discriminating purchaser.

Beads of a wedge shape are applied to a flat rim and held by rings which are rolled on an angle corresponding to that of the bead, so that when drawn down by clamping bolts, the bead acts as an inside cone wedge, with the result that the tire is firmly held to the rim, without air pressure or circumferential contraction.

A Tire so Locked to the Rim Incorporates a "Life Preserving Principle" and Reduces Tire Maintainance to an Economic Basis.

Parody on Patriotism.

Apart from all other considerations, and although the "man in the street" may never give it a thought, there is one side of the Vanderbilt Cup race that cannot but at least mildly agitate the blood of the thinking American possessed of a spark of national pride—the appearance of four Americans as representatives of other nations.

For one of them there is some excuse—he is hired to drive—but for the other three—well, they may be good sportsmen, but they are mighty poor Americans. The spectacle of these three rich men—Foxhall Keene, John B. Warden and George Heath—risking life and limb in order that an American trophy may not be won by America, and that Germany or France may be able to gloat at the expense of their own country is not one that teachers will hold up to the "young idea" as an inspiring example of patriotism.

The only satisfaction that is to be derived is from the discomfiture of that other peculiarly constituted American, Clarence Gray Dinsmore. Only those who have seen this officially credited representative of the Automobile Club of America fairly throwing spasms of joy because a hired German driving his (Dinsmore's) German car had defeated Americans driving American cars in the contest for the Bennett Cup can even mildly appreciate the depth of his present disappointment caused by the failure of his German vehicle to appear on American soil in time to assist the other rich American herrs and monsieurs in the endeavor to carry the Vanderbilt Cup from these shores.

The deeds of gift of these two famous trophies are quite explicit in requiring that the cars shall be, from rivets to engines, the production of the countries which they represent, but they are in fault in not requiring that their owners and drivers also shall be of their respective soils. Such deeds may stimulate commercialism, but they make a parody of patriotism.

Possibilities of Cement.

A factor of great and increasing importance in the fine arts, and one the value of which is increasing at a most astonishingly rapid rate, is the use of cement in construction work of all sorts. Prophets who are apparently well posted on their subject predict the approach of a "Cement Age," in which this wonderfully plastic substance is to be used in place of the older forms of building material almost to the exclusion of the natural elements. Whether or not this dream is ever to have an actual literal realization, or whether the use of cement and concrete in various ways is to have an unlooked for setback, either through the development of a worthier successor or through the development of some at present unknown fault, remains to be seen, but it is apparent that at the present time its utility is undisputed.

Wherever brick and stone can be used in any combination with mortar or with the metals, cement and its solid derivative can be used with greater facility at less expense, all things taken into account, and with results which are fully as lasting. Wherever the masons of the olden time laid stone upon stone to form their bridges and their buildings, the constructors of a later age put together their molds and into them dump an unsightly mass of pebbles and pasty looking dough, which after an interval reveals on the removal of the falsework a solid form like that of the stone or brick, only without seam or joint, and solid as the everlasting hills. Into it may be woven a fabric of metal for added strength, and the very presence of the cement covering it protects it from the deterioration which shortens the life of exposed metal. Its exterior surface may be dressed into the semblance of stone or brick or wood, and it will take and hold any sort of pigment or ornamentation which may be put upon it.

In its marvellous adaptability concrete construction is lending itself to all sorts of uses, and in this way it has come to have a significance to the motorist and to the automobile manufacturer which is by no means to be ignored. There is scarcely a garage but has its cement flooring, partial or entire; many small stables are built from it, and even its utility has appealed to the maker and he has constructed his factory of the new material. On the road, sidewalks and crossings are largely made of cement, gutters and cross drains are also frequently constructed in this way, and the suggestion has even been made that it is adaptable for the construction of highways which are not to be broken up by the hoof beats of horses and that will settle the ever growing dust evil.

In all this there is much which contributes largely to the convenience of the motorist. It cannot be said that the prevalent use of cement and concrete can in any way foster the automobile movement, nor is the motor car an essential in the development of the use of cement, yet it is evident that the two industries, both young in years and each possessed of wonderfully brilliant prospects for the future, are corelated in a measure and that each must play a part in the growth of the other.

Role of the Parts Maker.

Just how important a role the parts maker has played in the development of the industry in this country is probably far from being generally recognized or appreciated.

Being a specialist, the manufacturer who devotes his entire time and attention to the production of comparatively few of the essentials of the car is in a very much better position to simplify construction and reduce cost than is the average car builder. And by the installation of a great deal of automatic machinery, such as the average manufacturer would not be justified in using the parts maker has brought about this result. There are, it is true, some concerns who come as near to turning out the complete car from tires to top as it is possible for any single manufacturer to approach, but there are, on the whole, mighty few who are not

Digitized by Google

dependent in some way or other on the "parts man."

The advantage of this system of specializing on a few parts is the natural outgrowth of American machine shop tendencies in practically every line, and the assistance that it proves to the automobile builder is difficult to estimate. Therein lies one of the many points of superiority enjoyed by the latter over his European competitor, who must perforce turn out in his own works a very much larger proportion, if not all, of the constituent parts of his product, for it is impossible to buy them.

There is, of course, another side to the question, and that is the ease with which concerns of small capital and large pretensions can set up in the business of "building" automobiles in this country. However, while this has made such a state of affairs possible, it has not contributed to it unduly. Granted this, it must be conceded that the manufacturer of parts has done a great deal to advance the industry in this country, and will doubtless do more.

The Searchlight and the Horn.

Not once, but several times, has the Motor World condemned the use of powerful searchlights on the car, whether on the country road or not, and as much on the latter as elsewhere. The necessity for a light that would not look out of place gracing the fighting top of a cruiser certainly does not appear to be pressing, regardless of the nature of the roads to be covered.

The use of such a powerful light has more than once shown itself to be far from forming a guarantee of safety in speeding over dark and unfamiliar roads, and there are few places where it is safe to drive at all where the acetylene headlights of normal power will not suffice. On the other hand, the glare of the huge searchlights employed constitutes a menace to other users of the road. But all this has been gone over time and again, so that a repetition of the many reasons why such lights should not be used is hardly necessary. A great many of them will suggest themselves to the average observer who will give the subject a moment's consideration.

President Morris of the Automobile Club of America has now placed himself on record as being of this opinion, and advocates a law prohibiting their use on city streets, where the only possible result of their presence is to blind and confuse pedestrians. To this he registers an equally strong complaint against the growing use of loud sirens on the car, but, instead of advocating their abolition, is of the opinion that they should not be permitted unless musical, something in which he is joined by an ex-holder of the same office. Instead of the time honored "honk, honk" that has won a place for itself in the vernacular, we may be greeted with an obligato in B minor on the approach of a car. Truly, the æsthetic side of motoring is not languishing for want of attention.

Closed Cars vs. Furs.

In the early stages of the sport, only the most hardy and enthusiastic pioneers found it worth while to keep their cars out of the storage room during the winter months, and their appearance on the road approximated that of Esquimaux more closely than anything else. But winter driving has been steadily on the increase since then, and with each passing year there has been a corresponding jump in the demand for heavy furs and similar coverings sufficient to withstand the penetrating icy blasts that are felt more on the car than at any other time. Now with one accord even the pioneers who got as much glory as possible out of braving the elements at their worst have come around to the closed car, and those who would not drive formerly have found the means of making the car an all the year conveyance. The business of the furrier has suffered in consequence, and that of the carriage builder and body maker has increased correspondingly; there will be considerable difference both in the appearance and amount of comfort to be derived from the old order of covering and the new.

The Association of Licensed Automobile Manufacturers has forbidden horn tooting at the Madison Square Garden show, which will move most men who may or must attend that function to exclaim fervently, "For this relief much thanks." It is to be hoped that show promoters generally will go and do likewise; for of all the unmitigated and unnecessary nuisances that have been permitted to exist at the annual exhibitions none has been worse than the horn squawking nuisance.

Taking chances in an automobile usually amounts to betting a casual opinion against destiny, but when a man in a racing car makes a stab at a turn when the mist blows wet against his face, the odds are long and luck is generally with the "Imp of the Perverse."

The Week's Incorporations.

Worcester, Mass.—Worcester Automobile Co., under Massachusetts laws, with $1,000 capital; to sell automobiles. President—J. A. Dean.

New York City, N. Y.—The Brewster Automobile Co., under New York laws, with $10,000 capital. Corporators—C. C. Downey, H. M. Duncan and G. M. White.

Waco, Tex.—Waco Auto & Electric Co., under Texas laws, with $5,000 capital; to deal in automobiles. Corporators—M. T. Bell, S. M. Seal and B. P. Phillips.

St. Louis, Mo.—Automobile Supply Co., under Missouri law, with $4,000 capital; to make, deal in and repair automobiles. Corporators—William Mulford, E. A. Sluder and Freeman Wright.

Grand Rapids, Mich.—Auto Lorgnette Co., under Michigan laws, with $3,000 capital; to manufacture and sell automobile goggles. Corporators—John M. Himes, Augustin Hendricks and Gertrude Hendricks.

Springfield, Ohio—King Mfg. & Garage Co., under Ohio laws, with $20,000 capital; to sell automobiles and make tops. Corporators—D. K. Gotwald, Charles Klobensetter, John T. Ricks, A. F. Sparks and J. K. Williams.

Omaha, Neb.—Deright Automobile Co., under Nebraska laws, with $50,000 capital, $10,000 paid up; to buy, sell and make automobiles. Corporators—J. J. Deright, T. M. Bromwell, Max Reichenberg and L. L. Reichenberg.

Columbus, Ohio—Barndt-Johnson Auto Supply Co., under Ohio laws, with $25,000 capital; to make automobile bodies and tops. Corporators—Charles Barndt, W. E. Johnson, C. Chris. Born, Lewis P. Hoster and Thos. E. Curtin.

New York City, N. Y.—Central Park Automobile Storage Co., under New York laws, with $40,000 capital; to conduct a general garage business. Corporators—Alfred C. Rader, August C. Rader, Ralph A. Martin and Lester G. Bruggemann.

Massillon Resists Great Temptation!

Evidently the good citizens of Massillon, Ohio, have little faith in a new and approved gasolene buggy to sell for the small sum of $400. Perhaps they like their hard-earned money better. Anyway, W. E. Stone, C. H. Taylor and U. G. Smith, of Cleveland, have returned to their city after an unsuccessful effort to induce Massillonians to part with $30,000. What a pity, too, for the automobile was "a light runabout of eight and one-half horsepower, a gasolene motor, solid wooden wheels of the carriage type, with solid rubber tires, the box being set upon four springs not unlike a buggy, and would have been sold for $400 at a profit.

Trackless Trolley Man in Michigan.

F. W. Oliver, representing the F. W. Oliver Trackless Trolley Co., is in Commerce, Mich., looking into the proposition of establishing an automobile route between Pontiac and Lansing to pass through that city, Milford and Holly. He plans an hourly service. The Pontiac Board of Trade is considering his application for a franchise there.

READY FOR BIG RACE

All Arrangements Complete and Enormous Outpouring Indicated—Keene Dodges No. 13 but Ill Luck Pursues German Team—Practice Work Promises Fastest Race Ever Run.

Given dry roads, it is evident that the man and car that win the Vanderbilt Cup in the 283 mile race over Long Island roads on Saturday next, the 14th inst., will have averaged very much better than 60 miles an hour. This fact is made plain by the performances of the men who have deported themselves on the course during the past week. Their work is limited to the early morning hours, previous to 7:30 o'clock, and "holding watches" on them has been the favorite pastime of all who are most vitally concerned in the result.

These "railbirds" have clocked 60 miles an hour or over so often that it is too common to excite remark. There are tales of one round of the pipe-shaped circuit of 28 3-10 miles in slightly more than 21 minutes, or about 80 miles an hour, by Hemery, of the French team. This speed, however, seems impossible and is generally doubted. Apparently the best authenticated lap was negotiated by Szisz (pronounced "Cease"), also of France, who is credited with 23 minutes, 30 seconds. Three watches are said to have recorded this performance. Szisz has also been timed four circuits, 113.2 miles, in 106 minutes. Nearly all of the other foreigners have also made some remarkable flights. They are a skilful, daredevil lot.

Only the Americans appear not to have let themselves out, or at any rate the "railbirds" have not placed any startling performances to their credit. The general impression is that they stand small chance of victory. Walter White, in the powerful White steamer, who appeared the most likely one to turn the trick, has been doing a lot of dawdling on the course, but seems too cautious to do the turning. As one of his adherents expressed it, "I am afraid Walter is too much of a gentleman for this sort of thing." Walter Christie has offered the one ray of hope. With one of his four cylinders out of commission, he trailed Wagner, in the big Darracq for three laps, covered in 1:18:36, or at the rate of 65 miles per hour. Christie's car is, however, a terror on tires, and even if it has the speed tire troubles or its rubber ball action is expected to give him his quietus.

The German team has already been badly crippled, making it appear that if the red-haired Jenatzy does not show prominently a victory for either France or Italy is practically certain. Germany has indeed been in hard luck. Of the four Americans and one Belgian who comprise its team, two of the former are already out of it, and owing to the non-arrival of Clarence Gray Dinsmore's Mercedes it was necessary to impress a substitute, the power of which is in no way equal to that of its mates.

When Baron de Cater's withdrawal from the team was announced, S. B. Stevens, of Rome, N. Y., promptly filled the breach. He offered his Mercedes and his driver, A. L. Campbell, and they were accepted. Then Dinsmore's car was reported not ready, and H. L. Bowden, of Boston, presented his car as a substitute. But it has been altered since it came from Germany and now incorporates some American parts. Accordingly it was re-

THE ORDER OF STARTING.

Start, 6 a. m., at one minute intervals.
Distance, 283 miles; per lap, 28.3 miles.

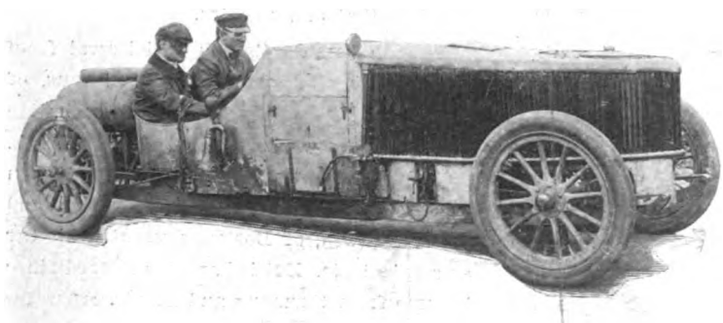
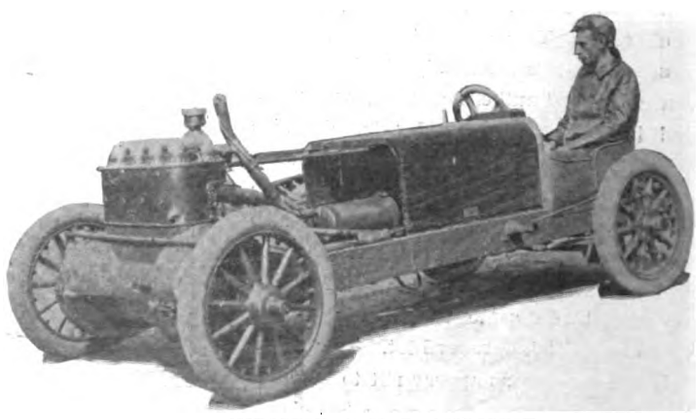
jected. On Tuesday, while practising on the course, John B. Worden, that other American millionaire whose patriotism is so great that he would assist Germany to win the cup, cracked two cylinders, and there seems small chance of his obtaining another pair in time to permit him to start. Foxhall Keene, the other of the unpatriotic American coterie, has also had his troubles. But they were mental, not machine troubles. The great big strapping American proved that he is saturated with superstition. He was alloted No. 13 in the order of starting and set up such a wail that it was silenced only when a redrawing of the team's positions was held for his benefit.



On the redrawing, Jenatzy again drew No. 1, while Keene was made happy when No. 5 fell to his lot. Warden, who previously held No. 5, got No. 9, and the Keene dreaded No. 13 fell to Campbell. The latter, however, was evidently possessed of those forebodings of ill luck which are supposed to follow that number, as it was finally eliminated altogether, and instead his car will bear the letter X, which sometimes stands for nothing. In this instance, it will stand for the mysterious fear of men who nevertheless do not hesitate to flirt with death at the wheels of the monster racing cars.



LYTLE AND CHAUFFEUR, 75 H. P. POPE-TOLEDO.

Although the Italians have not performed spectacularly, they have kept consistently at their work, and if Lancia and Nazzaro fail to finish well up in the running it will be a matter for considerable surprise. Lancia, who, until his car went wrong, was leading in the last Bennett Cup race, is most fancied. He is a rotund, moon-faced, good-natured fellow, who looks as if he hailed from the land of sauerkraut and frankfurters rather than the country where the garlic comes from. Yesterday Sartori ripped out his gears in the usual fashion—applying his clutch too quickly after making a turn—but it is expected that the damage will be repaired in season.

Several of the intending contenders have their wives with them, but none of the women appear to be so thoroughly interested as Mrs. Cedrino. The sight of that matron with rag and brush in hand, busily assisting her

husband in cleaning his car, is one of the sights of the Italian "settlement." These "settlements" are, of course, a feature of the preliminary arrangements. Each team has with them a retinue of trained helpers, and the babel of French, German and Italian which is heard when they mingle makes strange music to Long Island ears. Few of the men speak English, and the sight of Jenatzy, who is one of these, reading a red-headed "yellow extra" to the less fortunate foreigners, is one to be remembered. They appear to extract as much real enjoyment from the lurid stories of the sensational press as from anything else.

The Frenchmen and Italians had additional cause for smiles yesterday when Monsieur Michelin made it worth while to finish the race regardless of position. He cabled a prize offer of 5,000 francs for first prize, 3,000

SZISZ, 90 H. P. RENAULT.

for second, 1,500 for third, 1,000 for fourth and 750 for fifth places, while for all those who drive cars fitted with Michelin tires which finish after the fifth man there will be an award of 500 francs.

The arrest of several of the drivers for overspeeding after the early morning hours set aside for practice work has made them cautious, if it has not wholly checked their scorching. The joke of the week, however, the point of which, every one, including the victim, has shared, was the arrest of Robert Lee Morrell, chairman of the Vanderbilt Cup Commission, and temporary Poo Bah of that section of Long Island bounded by the course. It was at Morrell's instigation that traps were set to catch the scorchers, not merely the cup contenders, but the many visitors who have labored under the delusion that they were free to "cut loose," and it was

LANCIA, 120 H. P. F.I.A.T.

NAZZARO, 120 H. P. F.I.A.T.

into one of his own traps that Morrell fell. A chauffeur who had been arrested telephoned to Morrell for bail, and the latter made haste to answer the call. He went so fast that he was stopped by three stopwatch deputies, who did not recognize him, and who haled him before the Justice who is holding court on the spot. The result was a fine of $25.

Portions of the course are being reoiled, all bad spots repaired and the worst turns, which have been badly ploughed up by the practice work of the men, are being banked. In order to prevent the dangerous stampede on the course which marked last year's race after the first two men finished, a wire fence will be erected for a mile on both sides of the grandstand.

That the race will prove the biggest thing that ever occurred on Long Island there is every evidence. Within the past week unexpected interest in it has developed, and there is promise of a tremendous outpouring. Every seat in the grandstand has been sold, and an addition will be built in order to meet the demand. Every bed and cot in every house for miles in the vicinity of the grandstand at Mineola has been bespoken, and at prices which a month ago would have seemed fabulous to many of the more or less gentle Long Islanders, who now name their figures as though they had been accustomed to obtaining it all their lives. That many late comers will be required to sleep standing up goes without saying. The fact that the race will not start until 6 o'clock, and that the Long Island Railroad will run early morning trains at 3:35, 4 and 5 o'clock, and boats

REMAINS OF THE GERMAN TEAM.

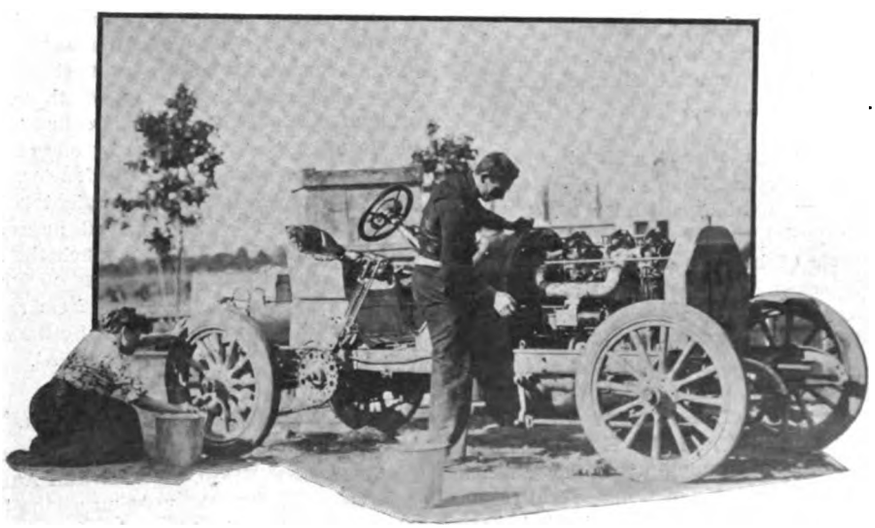
JENATZY, 120 H. P. MERCEDES.

KEENE, 120 H. P. MERCEDES.

every fifteen minutes, are the relieving features of the situation. It will enable many of the New Yorkers to snatch forty winks before departing for the scene of the contest. But only the clubmen, and those who are so fortunate as to be acquainted with them, will be in clover. The Automobile Club of America and the Long Island Automobile Club will have tents erected in which breakfast will be served, while the New York Motor Club has leased a cottage for the night and will do likewise.

A casual study of the specifications of the machines which have been declared for the race reveals the interesting fact that among the twenty cars on the list but ten different makers are represented, the German and Italian teams being made up in each case of the cars of a single manufacturer, the Mercedes in the first instance, and the Fiat in the second. The French and American teams have each two cars of a single make, the Darracq in the first instance, and the Pope-Toledo, in the second, thus leaving but a single representative of the ancient and honorable house of Panhard; the Renault and the De Dietrich, for France, and on the American team only the Locomobile and the White as representatives of well known houses.

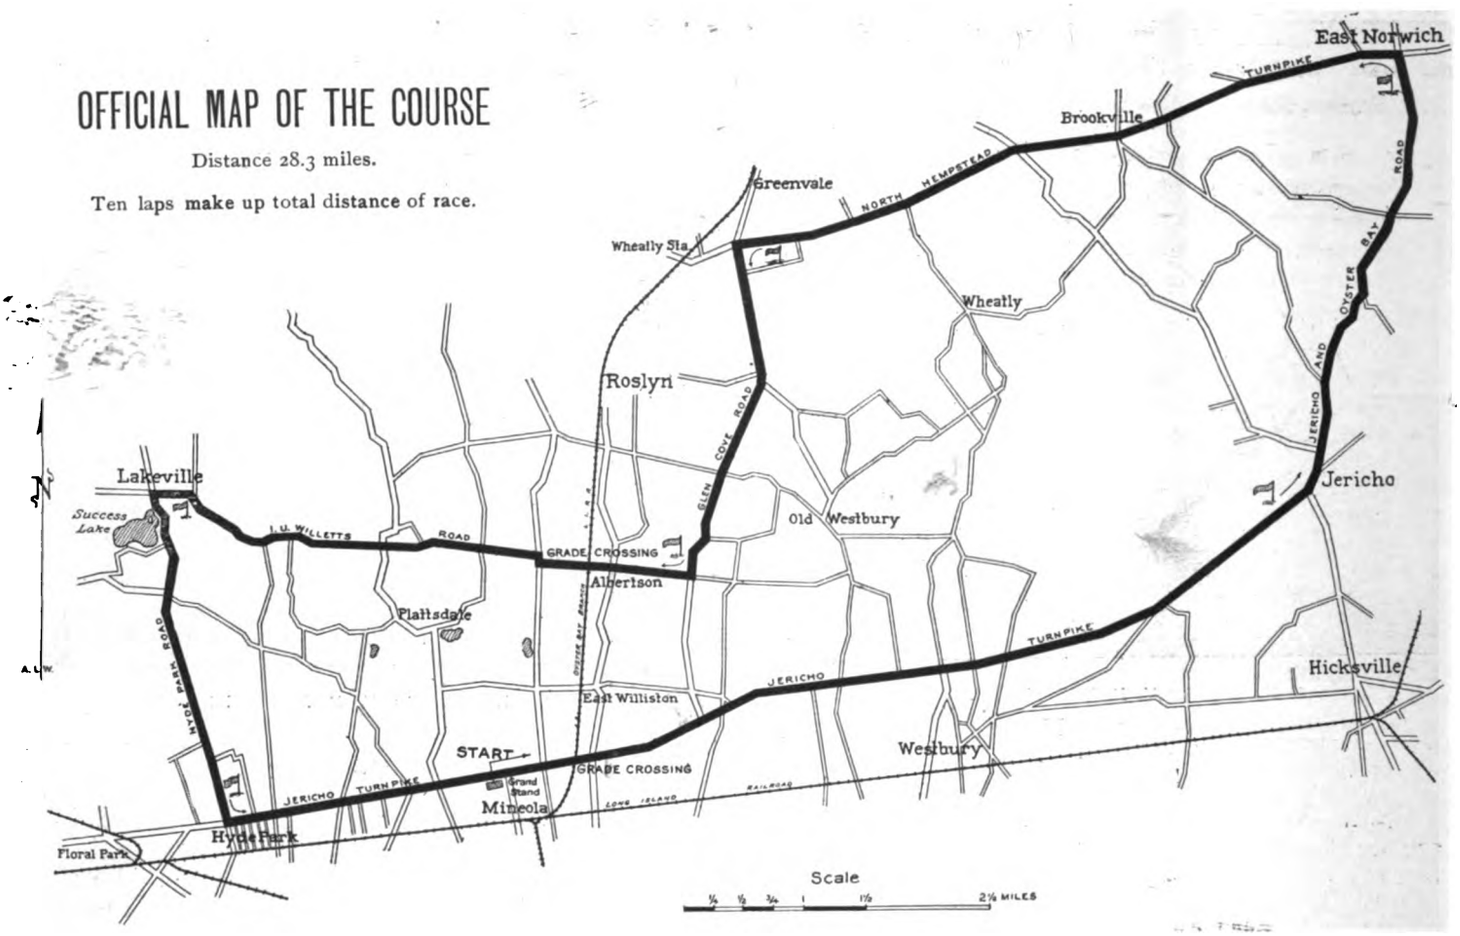
In point of design the two makes of car which are best shown are quite alike down to the last detail, the Fiat being a Mercedes copy and in many ways a betterment of its prototype. In horsepower they are all rated at either 120 or 90; all are equipped with four cylinder motors, cylinder volume being slightly in favor of the Mercedes in the 120 horsepower, and the Fiat in the case of the 90 horsepower cars. Both are equipped with the low tension system of ignition, with make and break igniters, and both are chain driven. The Mercedes cars, however, have the longer wheel base in each case.



As to the salient features of the other cars, the horsepower varies from the 120 Panhard, which Heath is to drive, down to the 40 horsepower White, unique in more ways than one. Apparently among the French and American designers there is a leaning toward the jump spark method of ignition, for with the exception of the Locomobile all the cars on the two teams have one of the two high tension systems, the Frenchmen inclining toward the magneto and the Americans toward the accumulator. France exhibits but a single car having the chain drive, the De Dietrich, and America but one equipped with the shaft transmission, the method of double chain transmission holding in favor with the builders of thirteen out of the total of twenty machines. As to wheel base, the German cars have the greater length, with the Italians second, the shortest cars of all being on the American team.

In appearance the Christie, the White, Lytle's Pope-Toledo, with its long bonnet; the beetlelike Renault and the Darracqs, with their wire wheels, are the only machines which are easily to be distinguished when running at speed. Heath's Panhard has a square bonnet, to be sure, but so have the Darracqs, and when coming head on there is but little to show the difference between them, unless it be the heavy diapason of the Panhard motor.

Certain of the specifications of the competing cars will not be made public until the weighing in on Friday, notably the weights and tank capacities.



The following will be the officials of the contest:

Robert Lee Morrell, chairman. Referees—William K. Vanderbilt, Jr., A. R. Pardington, associate.

HOW MRS. CEDRINO HELPS HER HUSBAND.

While most of those who will reach the course per automobile will follow the crowd and go via the Thirty-fourth street ferry, Long Island City and the Hoffman Boulevard, to those who would avoid the scramble and some of the dust the Motor World recommends the route via Astoria, which is but six minutes from New York by ferry from East Ninety-second street. Follow the asphalt past the Astoria cemetery, thence the road is direct to Flushing, and, via Main street and Jamaica avenue, to the wide Highland avenue in Jamaica, where turn left and "follow the dust." The via Long Island City crowd will be encountered at this point.

The course itself will be closed to traffic from 5:30 a. m. to 2 p. m.

The New Game in Wisconsin.

A new game, not of the parlor variety like "Flinch," "Pit," "Sherlock Holmes" and the like, but one which is guaranteed to cause more excitement than any of these, has originated in Wisconsin. It is called "Catch the Motorist," and is played by one or more farmers with motorphobic tendencies. The game is simple, all that is required being a piece of barbed wire stretched across the road at a sufficient height to catch the automobilist who attempts to pass under the chin. If the motorist is pulled from the car one point is scored; if he is cut by the sharp barbs as well, two points are tallied.

A. A. A. Receives Big Accession.

Several new clubs, as follows, were admitted to membership in the American Automobile Association at the meeting of the board of directors held in the rooms of the Automobile Club of America, New York City, on Thursday of last week: The Associated Automobile Clubs of New Jersey, comprising the North Jersey Automobile Club, of Paterson; the Atlantic City Automobile Club, the Automobile and Motor Club, of Newark; the Mercer County Automobile Club, of Trenton; the Monmouth County Automobile Club, of Asbury Park, and the Hudson County Automobile Club of New Jersey. The Hagerstown Automobile Club, of Hagerstown, Md., was also admitted to membership. It was also announced that what might be termed a reciprocal automobile treaty for the interchange of club courtesies, whereby members of this and foreign clubs will be brought into more friendly and helpful relations, particularly when touring abroad, was authorized with the Touring Club of France, the Automobile Club of Great Britain and Ireland and the Motor Club of Belgium.

Springfield Club Elects New Officers.

At the annual meeting of the Springfield (Mass.) Automobile Club, held last week, the following officers for the ensuing club year were elected: President, Stanford L. Haynes; first vice-president, Dr. H. C. Medcraft; second vice-president, I. H. Page; third vice-president, George H. Bausch; fourth vice-president, Frank E. Bocorselski; secretary, J. W. Norcross; treasurer, W. L. Bunker; directors, H. G. Farr, H. C. Martin, F. S. Carr, Mark Aitkin, W. A. Ford, Dr. V. J. Irwin and M. T. White.

SMALL ROW AT ROCHESTER

Soules Makes Fastest Time in Hill Climb, but His Amateur Standing is Questioned.

Approximately one thousand people, a small crowd, perhaps, but not the less enthusiastic, witnessed the first hill climbing contest ever held in Rochester, N. Y., which was promoted by the Rochester Automobile Club last Saturday afternoon, 7th inst. The event was held on the Dugway hill, half a mile long, with a grade of 8 per cent. The fastest time of the afternoon was made by one of the Soules brothers, who drove F. E. Woodworth's 30 horsepower Pope-Toledo. He covered the distance in 48 seconds, which is excellent time, considering there are several turns in the road. It is likely, however, that Woodworth's car will be disqualified, as the events were supposed to be open to amateurs only, and it is well known that Soules, whether he be George or Charles, belongs in the professional class.

The next best time in Class A, for cars between 32 and 50 horsepower, was also covered by a 30 horsepower Pope-Toledo, driven by Stoneburn. He made the ascent in 0:52½. Hart, driving a 28 horsepower Pierce, won the cup offered in Class B, for cars of 22 to 30 horsepower, making the climb in 1:00 flat. F. E. Mason, 20 horsepower Premier, was second, in 1:05½.

Ten cars were sent off in the event for machines rated from 16 to 20 horsepower, and a "Sixteen" Premier, with Hart at the wheel, took the honors, making the climb in 1:06, although he was hard pressed b E. I. Taylor, who drove a 16 horsepower Ford. Taylor's time was 1:08 1-5. R. Roberts, 16 horsepower Reo, finished third. In the class for cars up to 12 horsepower, the Ford runabout, driven by E. I. Taylor, scored a victory, making the ascent in 1:14. Peter Hauck, 12 horsepower Franklin, was second. In all there were twenty-seven starters, and as each car was sent up the incline just as its predecessor finished, and as no accidents occurred to mar the meet, it may be said to have been highly successful. The summary follows:

Class A—32 to 50 Horsepower.

Soules, 30 h. p. Pope-Toledo.....0:48
Stoneburn, 30 h. p. Pope-Toledo.....0:52½
W. F. Schafer, 50 h. p. Thomas.....0:58½
B. M. Richards, 30 h. p. Thomas.....1:02 4-5
G. W. Hirkover, 32 h. p. Royal.....1:11¾
J. Moynihan, 32 h. p. Pierce.....1:26 4-5

Class B—22 to 30 Horsepower.

L. J. Hart, 28 h. p. Pierce.....1:00
F. E. Mason, 20 h. p. Premier.....1:05½
H. K. Elston, 24 h. p. Pope-Toledo...1:07 3-5

Class C—16 to 20 Horsepower.

F. E. Mason, 16 h. p. Premier.....1:06
E. I. Taylor, 16 h. p. Ford.....1:08 1-5
R. Roberts, 16 h. p. Reo.....1:13
F. Dalzell, 16 h. p. Elmore.....1:18 1-5
R. T. Snapp, 16 h. p. Reo.....1:19 2-5
F. Dalzell, 16 h. p. Reo.....1:24 4-5
W. Williams, 16 h. p. Jackson.....1:27 4-5
J. S. Bingman, 16 h. p. Marion.....1:33 2-5
G. B. Selden, 16 h. p. Columbia.....1:37
A. L. Becker, 18 h. p. Wayne.....2:07 3-5

Class D—8 to 12 Horsepower.

E. I. Taylor, 12 h. p. Ford.....1:14
Peter Hauck, 12 h. p. Franklin.....1:16
R. Gorsline, 12 h. p. Franklin.....1:19
Dr. Graham, 12 h. p. Ford.....1:20½
R. T. Ford, 12 h. p. Franklin.....1:21
F. Dalzell, 8 h. p. Cadillac.....1:25 4-5
H. G. Strong, 10 h. p. Franklin.....2:52
Wackerman, 6½ h. p. Pierce Stanhope.3:56

Atlanta Now Has a Club

Fifty-two automobile owners in Atlanta, Ga., have formed the Atlanta Autotmobile Association, with these officers: President, J. P. Stevens; vice-president, J. H. Nunnally; secretary-treasurer, Charles Elyea; directors, E. H. Inman, W. H. Kiser, H. M. Ashe, Reuben Arnold, R. L. Cooney, C. H. Johnson and Dr. F. W. McRae. The work of forming a constitution and bylaws, making application for a charter and applying for membership in the American Automobile Association was left to these officers

Three Tickets in Chicago.

Chicago's fight for municipal ownership does not interest members of the Chicago Automobile Club half as much as the coming club election. There are three factions, and there will be three tickets in the field next week, when nominations are made. The factions are called, first, the Peacemakers, now in office; second, the Anti-Commercialists, who would oust every member connected with the trade from the club's roster, and lastly, the Radicals, who will fight unjust legislation.

'Frisco Women Form a Club.

San Francisco, Cal., now has a woman's automobile club, organization having been perfected last week. One of the alleged bylaws of the Woman's A. C. of San Francisco succinctly states that no men will be allowed to accompany the members on club runs. Mrs. A. J. Marsh is president, Mrs. F. Linz vice-president and Mrs. J. Gabriel secretary and custodian of funds.

Circus Stunt New Style.

While W. F. Norwoldt, F. W. Winnett and some one connected with the Southwestern Garage Co., of Los Angeles, Cal., were laughing at the antics of a clown, their cars, which had been left outside the circus tent, mysteriously disappeared. According to late reports, neither the culprits nor the stolen cars have yet been discovered.

Economy Test Postponed One Week.

Announcement has been made by the New York Motor Club that its first economy test has been postponed from the week beginning October 23 to the week of October 30. Up to Tuesday night eight cars had been entered, six of which are air cooled.

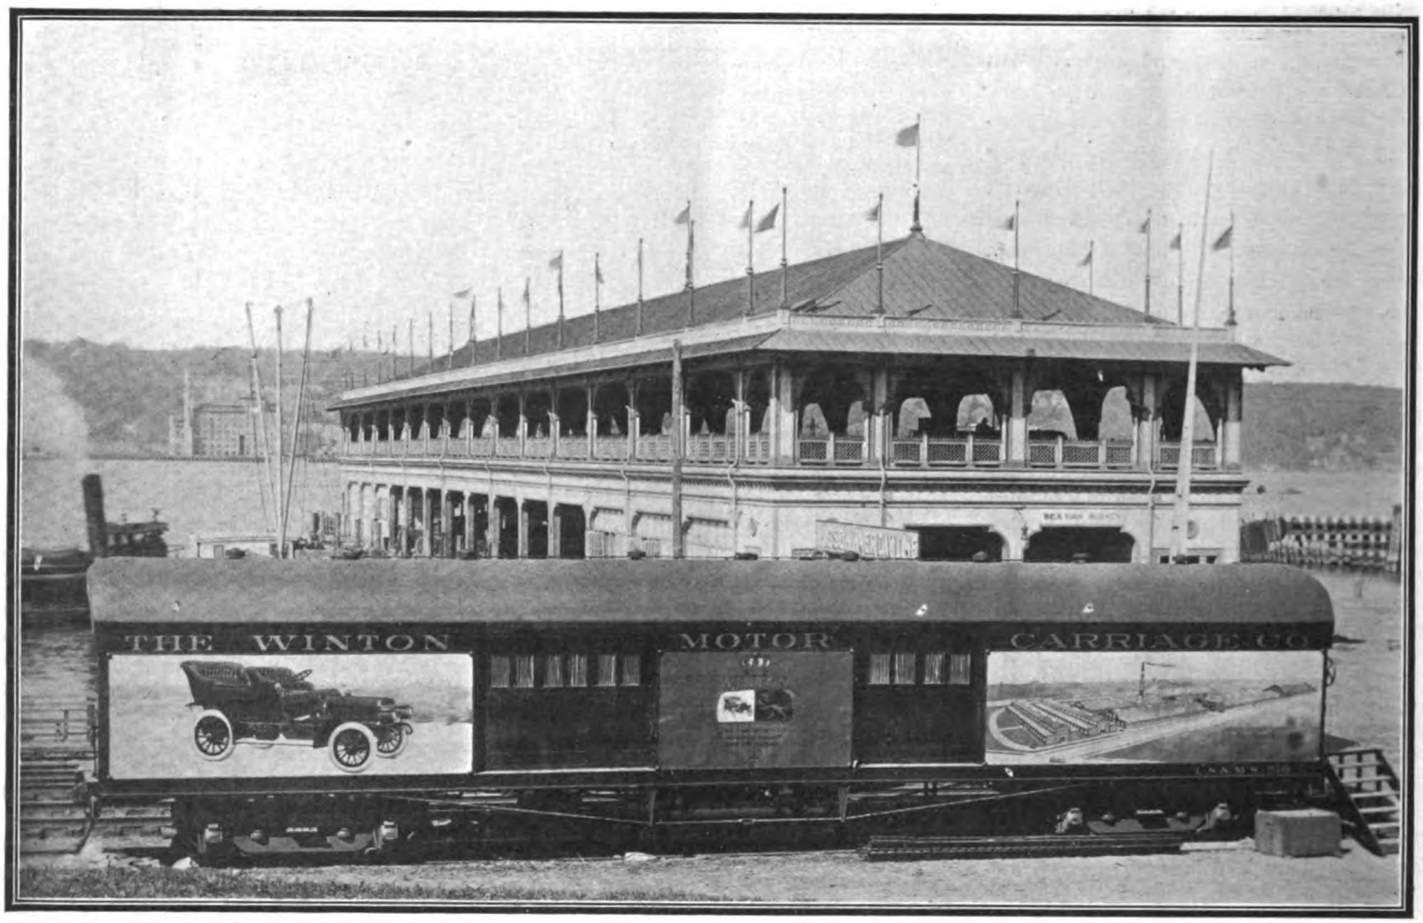
DEFEATING POLICE INDUSTRY

London's Story of Scouts Employed to Locate Traps and to Warn Motorists.

"Bobby" and his backer, "the J. P.," have overdone the thing, and as relief is apparently not forthcoming through the regular channels, though Parliament has been petitioned ad libitum, English automobilists have reached the limit of endurance and are banding together to fight their persecutors on the ground and in their own way, with results that are, to say the least, amusing. According to a cable from London, there has been appointed a committee, comprising a number of prominent automobilists, and the latter has in turn organized a campaign against the police and their underhand methods, and, incidentally, to hold up the police trap to ridicule. Several complete routs of the bluecoats on Brighton and Plymouth roads have already taken place. The automobilists' force is divided into scouts and patrols. The duties of patrols include the observance and report of any incident of interest, the offer of assistance to automobilists who have broken down, the warning of all drivers who may be travelling too fast, and the collection of numbers of cars and names of witnesses in the event of collisions with the police.

The scouts are professional racing cyclists, whose business is to find the police traps, keep in touch with the patrols, and convey warnings and information to drivers with all speed. They will make a full report to the committee of the association, so that the latter can survey traps with a view of exposing their futility before the coming royal commission on automobiles.

The methods pursued by the scouts in circumventing the police are as follows: Immediately the news of a police trap is brought in by the patrol a pair of scouts are sent out. They approach the spot and by carefully searching for footprints are enabled to locate the probable position of the trap. They then make a detour and get behind the position, and more than likely will then be rewarded by the sight of two bulky policemen crouching in undignified attitudes at the distance of a furlong from each other.



A plain clothes man will probably be seen on the road wearing a pantomime beard, smock frock and regulation boots, which he struggles to hide. Then the scouts dart away and warn all cars as they come along the road.

The scouts do not give the plain clothes man on a bicycle a chance. They easily pierce his disguise and cling to his heels to watch his every movement.

The great objection of automobilists to these traps is that they are, in nine cases out of ten, worked in places where there could be no possible danger to any living creature from automobiles. They are seldom placed in dangerous parts of the road or in villages.

How the Winton Will Cross the Continent.

"Winton's Own Automobile Show" came to New York on Thursday of last week and remained for three days, when it took wheels for Philadelphia. While in New York it held its doors open in the railroad yard at One Hundred and Twenty-ninth Street and North River. The accompanying illustration gives an idea of the striking structure in which the "show" was housed. Within it were displayed a highly polished chassis and a complete touring model of the 1906 Winton—Model K, as it will be styled. The interior of the "show building" was handsomely finished in white and gold and was illuminated with 200 incandescent lights. In one end of the car a well appointed office is laid out, which is presided over by C. B. Shanks, sales manager of the Winton Motor Carriage Company, who will accompany the "show" on its travels across the continent. The novel "show" had already visited Detroit, Buffalo, Rochester, Boston, and from Philadelphia will go to Pittsburg, Columbus, Cincinnati, Indianapolis, St. Louis, Chicago, Milwaukee, St. Paul, Minneapolis, Omaha, Kansas City, Denver, Salt Lake City, San Francisco and Los Angeles.

Here's a Sweet Story.

In these days of rapid construction, says United States Consul Atwell, Roubaix, France, it will be reassuring to learn that extended time is no longer required to place well seasoned wood on the market. It is claimed that the process invented by Mr. Powell, an Englishman, gives artificial age to wood. He replaces the sap of trees by beet sugar or saccharine, which acts as a preservative of the wood by driving the natural humidity from the fibres.

The following is the method employed; Newly felled wood is laid on a wagonette, which is rolled into a huge cylinder, the interior of which is provided with pipes. Either hot or cold water, as occason requires, may be introduced into these pipes. The wood having been placed in the cylinder, the latter is supplied with sugar or saccharine. Hot water is then forced through the pipes. The contact of the heat boils the sugar, which penetrates the pores of the wood. The cooling process is accomplished by a current of cold water forced through the pipes. The cylinder is emptied of the sugar or saccharine, and the wagonette, with its burden of wood, is rolled into a special room, where it is dried by currents of hot air. After being cooled again, the wood, properly seasoned by the sugar, is ready for use. It is said not to spring or gather dampness, and to be proof against destruction by insects.

The Great Western Railway Co. of England now has in its service no less than eighty motor omnibuses running in various sections of its system, and they have given such great satisfaction during the period of their use that the company has made them a fixture in the feeder service which is essential to the proper working of a great railway. And yet the territory covered by the road is no larger than that of the average railroad of the United States.

Welding Steel to Iron.

In welding steel to iron, fork the iron and insert the steel. As the iron requires to be at a higher heat than the steel, insert it in the fire earlier. In very particular work some smiths use separate fires, charcoal for the steel and coke for the iron.

Borax, to be used for welding, should first be melted and then ground up. The following compound makes an excellent flux and is readily prepared: Borax, 8 pounds; sal ammoniac, 1 pound; yellow prussiate of potash 1 pound. Dissolve all together in water, and then evaporate them to dryness at a gentle heat, stirring constantly.

In general, the forms of iron may be grouped by the amount of carbon contained. Wrought iron and machine steel have from 1-100th to ½ per cent of carbon, the two differing in grain and method of manufacture. Tool steel has from ½ to 1½ per cent, and cast iron from 2⅓ to 4⅓ per cent of carbon.

ANNOUNCEMENT

The 1906

Rainier

30-35 H. P.

has arrived. Come and inspect, ye automobile experts—you who really appreciate beautiful workmanship and design and you will admit that at last THE American automobile has come. Look over the following specifications, then call and try the car.

Engine.	30-35 H. P., 4 cylinders, water cooled.
Ignition.	Sims-Bosch Magneto—make and break spark.
Transmission.	Sliding train. 3 speeds forward and one reverse.
Rear Axle.	Bevel gear drive, clutch driven hub. Ball bearings.
Front Axle.	I Beam section. Ball bearings.
Frame.	Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.
Wheel Base.	104 inches.
Wheels.	Imperial whalebone, grade A 2nd growth hickory.
Tires.	Continental 34 x 4.
Valves.	Mechanically operated, inlet and exhaust interchangeable.
Carburetter.	Float feed, requiring no adjustment.
Brakes.	Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
Body.	Full aluminum, double side entrance.
Equipment.	Two head lights, 2 side lights, 1 rear light, 1 horn.

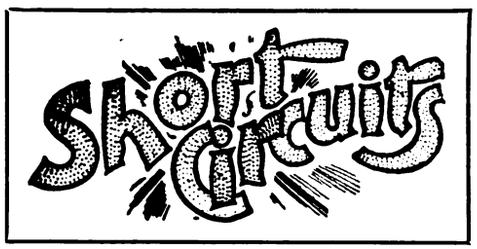
Price, $4,000.

The 22-28 H. P. will be continued as heretofore, without any changes.

4 cylinder—98 inch wheel base—La Coste coil. French battery. Continental Tires. Aluminum side door body.

Price, $3,500.

BOTH MODELS GUARANTEED FREE OF REPAIRS FOR ONE YEAR.



The world's broadest and most liberal automobile guarantee. Landaulet bodies for immediate delivery. Limousines for October and November delivery.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Boston Agents. MORRISON-TYLER MOTOR CO.

Good Agents wanted in unassigned territory.

Digitized by Google

Papers of incorporation have been taken out by the Granite State Automobile Club, of Manchester, Vt.

A rusty place on the rim of a wheel is likely to cause a cut in the tire. Rims should be kept covered with paint or enamel.

Lowell has another claim to being the model city in Massachusetts. Thus far this season not an automobilist has been arrested for excessive speeding within the confines of that city.

Before starting on the next instalment of his "round the globe, to be continued" tour C. J. Glidden will deliver a lecture before the Boston Y. M. C. A. automobile school on his exploits to date.

The Minneapolis Automobile Club has announced its intention of "spreading itself" by putting up a cup, surpassing the Vanderbilt and Glidden trophies in design and cost, to be contested for annually at the Florida tournament. It will be called the Minneapolis Cup.

"Wonders will never cease!" Glencoe Village has passed an ordinance extending the speed limit for automobiles from eight to fifteen miles an hour. Hostilities between the Chicago Automobile Club and the village authorities will probably now be brought to an end.

Dr. A. A. Sidler wants the city of Milwaukee, Wis., to pay for his automobile. He alleges that on September 22 he ran into a manhole on Trowbridge street, which was twenty inches above the street level. Dr. Sidler claims his car was totally ruined, and therefore demands $975 for damages.

Rapid transit will be a certainty in Nyack, N. Y., and its environs if the promoters of the Rockland County Stage Motor Co. meet with sufficient encouragement from the business men of the place. It is proposed to establish a line of motor cars on the route between Upper Nyack and Sparkill and to West Nyack.

Hereafter Amesbury (Mass.) merchants will have to open their boxes some place other than on the sidewalks. Automobilists have complained to the police department that the merchants open the boxes and then throw the nails into the street, wreaking damage to tires. Officer Moison has been detailed on the case.

"Automobile Day" was the feature of the Brockton (Mass.) fair last Wednesday, and a conservative estimate placed the number of cars in the inclosure at three hundred. For having come the longest distance R. P. Hazzard, of Hallowell, Me., was awarded the silver loving cup, while T. G. Cunningham, of Springfield, Mass., won the cup for the best decorated car.

Great Britain has two automobilists who probably hold the age record. Their car will run a good race, in point of antiquity, with any other motor vehicle still in active service. The couple are Mr. and Mrs. Wood, of Herts, whose combined age is 163 years. Mrs. Wood is eighty-two, while her husband is younger by a single year. Their car is a 3½ horsepower Benz, which was built in the last century, 1898.

The pioneer Haynes car of 1893 is to find a last and honored resting place in the National Museum at Washington, D. C. The authorities recently made application to the Haynes Automobile Co., Kokomo, Ind., asking that Elwood Haynes's first horseless carriage be given a permanent home in the museum. The machine was unfortunately in a freight wreck when returning from the Boston show and some of the parts need replacing. As soon as this is done it will be shipped to Washington.

As the nights grow colder the automobile driver will do well to remember the oft told injunction to squirt a few drops of kerosene into the cylinders of his machine whenever he brings it in from the road, and to give the crank a few turns. It will free the walls from any accumulation of heavy oil, which under the influence of the cold tends to congeal, and render starting more difficult when the motor has had time to cool, and also tends to clog the packing rings in their grooves and render them liable to breakage.

The solitudes of Mount St. Bernard, where dwell the celebrated monks and their no less celebrated dogs, are being invaded by the rhythmic throb of the motor truck. A machine of this description, capable of dealing with a load of five tons, is being introduced for the purpose of transporting supplies from Martigny up to the famous hospice. The first climb of the truck was made recently. It presented a somewhat entertaining appearance, for, with a view to convincing the horses of the district that the machine was harmless, a representative of Dobbin communis was harnessed in front of it, forming a sort of animal figurehead. The tremendous climb was successfully accomplished in a single day.

Gasolene is a substance that is not to be treated lightly wherever it may happen to be found, as witness the experience of some young Englishmen in a boat recently. Some automobilists that were about to embark on the boat from New Haven to Dieppe emptied the contents of the tanks of their cars promiscuously, most of the fuel finding its way into the river, where it floated off down stream. One of the aforesaid young men out of curiosity lighted a match and threw it on the surface to see if the gasolene would burn. Instantly a fierce flame is said to have shot into the air, setting fire to the boat and the man's clothes. He immediately jumped overboard to extinguish the flames, and was severely burned before being rescued. His companions escaped without injury.

The old "Cannon Ball" road, or at least that part of it running through the property of Howard P. Frothingham, at Wanaque, N. J., is no more. That was settled at a hearing held last Saturday afternoon at Pompton by the commission named recently by the court to examine into the road and its condition, in accordance with a petition asking for the abandonment of the road. The famous old road began near Hilltown, N. Y., where there was at one time an old forge. Here the Tories made cannon and shipped them by team to Lord Howe's army during Revolutionary times. Although practically impassable for years, the historic highway has been an objective point for automobile tourists.

The Tale of the Tailor.

Not even the most imaginative of press agents was keen enough to discover "automobile chest" as another and most convincing argument why the public should buy the particular car he was paid to dream about, but the new recommendation belongs equally to all kinds of cars except those that do not go, so probably there may be some bright mixer of automobile stories and advertising that knew of this all along, but did not think it worth while.

The story came out in this way: While in the throes of being measured for a suit of clothes the tailor suggests to his customer:

"Been taking a lot of exercise, Mr. Blank?"

"Why, no," replies the customer. "What makes you think so?"

"Because your chest is fully two inches larger round than it was last year," remarks the tailor, again asking if he had not changed his habits in some way or other.

Again the reply was in the negative, but the customer admits to having done considerable automobiling, adding: "But there's no exercise in that, and particularly nothing to expand the chest."

Then the tailor speaks his little piece and announces the discovery up to which he has been leading.

"Automobiling," he declares, "is exercise and its effects are particularly noticeable in increasing chest measurements. I've seen it in a number of my customers, who don't indulge in athletics as ordinarily understood, but who do a great deal of automobiling. And it isn't the steering either, for the increase of chest comes whether they act as their own chauffeurs or sit on the back seat and do nothing. Apparently it's the effort required to breathe rapidly moving air, and the purity of the air may have something to do with it."

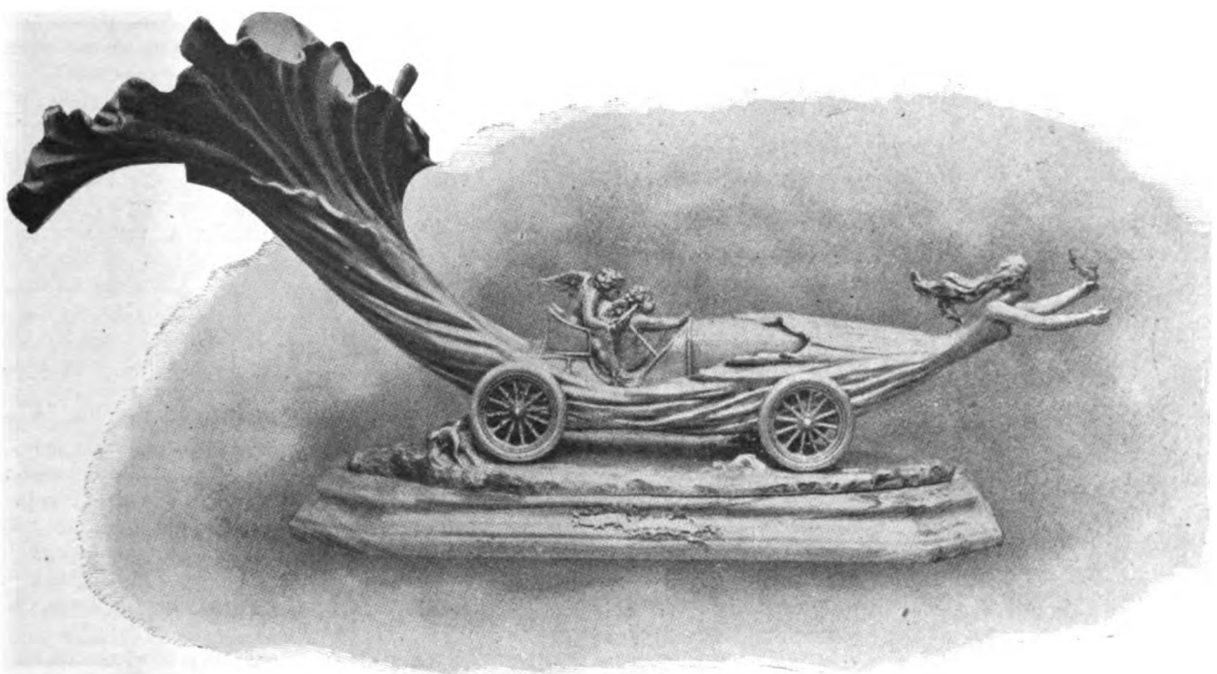
TOURING TRIALS TOO COMPLEX?

That Belief "Gives Pause" to French "Sportsmen"—Odd Origin of Bennett Cup Story.



Paris, Sept. 26.—After the disappointing results of racing this season, when the existence of the sport seemed to be threatened by the abstention of makers and the strange attitude of the French Automobile Club, there was every reason for concluding that long distance racing had had its day. The French manufacturer would not look upon racing as a sport, but simply as a costly advertisement, and so long as these big events were regarded as a criterion of international supremacy in the motor car industry he refused to take part in them, unless the different countries were represented in proportion to the extent of their respective industries—that is to say, France was to have a much larger number of cars running than her foreign competitors.

There was, of course, not the slightest hope that other countries would fall in with these singular views. They could not be expected to support races in which the numerical odds would be enormously in favor of the French. Under these circumstances the French Club withdrew into its shell and waited to see how things would develop. As they expected, the Bennett Cup event petered out when other countries found that there would be no honor, and perhaps little profit, in competing for a trophy from which the leading competitor held aloof, and perhaps also these countries had little desire to take upon themselves the heavy financial burden of organizing such a race. The French club made a pretence of dissociating itself from races in any shape or form, and began to work out the proposal for holding a vast trial of touring cars which is to constitute the principal event for 1906. For the moment, we heard of nothing but touring trials, which seemed to have already taken a definite and all important standing with the Pyrenées Cup, the Herkomer Cup, the Tourist Trophy in the Isle of Man and the Glidden Cup. The motor car industry was to develop in future with the aid of touring trials carried out upon such lines as to interest the mass of the public, and, by showing what practical types of vehicles could do, bring in plenty of orders to makers of the successful cars.

This vogue of touring trials has been carried so far that the trade is now pausing to consider whether they are, after all, the best means of improving the car and awakening an interest in the automobile for the benefit of the motor car industry generally. Touring trials are not objected to in principle, but with their positive minds the French like simple, clear and definite results, without any of the complication usually adopted in tests of touring vehicles. They do not approve of trials in which dozens of factors are worked out to a mathematical formula, because, with such a machine as the automobile, they do not think that any juggling with figures will give convincing and satisfactory results. The factors of speed, price, consumption, efficiency, comfort and the rest of it are often so much at variance with each other that it is very difficult, if not impossible, to work out a formula that will result in the best car winning—that is to say, the car that is the best suited for all classes of automobilists. This difficulty was observable in the Pyrenées Cup trials, and in the Tourist Trophy competition in the Isle of Man the cars competing were mere apologies for touring vehicles, scarcely one of them being presented as it would be if sold to customers. The French fear that with these complicated formulæ the way will be laid open for all sorts of trickery, when the trials will be worse than useless.

As touring trials have certainly come to stay, it is proposed to find a way out of the difficulty by organizing a reliability test to be based upon points in the usual way, and then running the successful cars in a purely speed and consumption test similar to the Tourist Trophy competition in the Isle of Man. The reliability test would simply be a qualifying competition to insure that the vehicles are of a really practical touring type, and the final results would be based mainly on speed and economy. This, however, is only one of the numerous suggestions that will have to be thoroughly threshed out during the next three months so that the club will be able to settle upon a form of touring competition that will give satisfaction to all concerned.

It is fairly certain that touring trials will constitute one of the principal features of next year's programme. But it is too early yet to say whether racing will be altogether abandoned. The difficulties referred to with touring trials have led several firms to come round to a more favorable opinion of racing as being the only clear and positive way of testing the qualities of vehicles, and if it be found that manufacturers would like to see racing resumed the club will be obliged to do something on these lines, in the way, it may be, of a Grand Prix, about which so much was said at the beginning of the year. Although nothing can be said definitely until the club terminates its programme, it is, nevertheless, possible that we shall be having one big race and a big European demon-

THE FLORIO TROPHY.

Digitized by Google

stration of touring cars, as well as a number of touring trials organized by different provincial clubs. The hill climbing tests will, of course, continue as heretofore.

In Italy also the outlook is a little more encouraging, and the sport is not likely to be suppressed in the way that was threatened by the recent manifesto of the president of the Automobile Club of Milan, who said that henceforth races were to be replaced by touring trials. A good deal of prominence was at first given to this manifesto, because it was thought that it voiced the opinions of the club generally, but it seems now that the president of the club is only representing a small group who are trying to make political capital out of this question of racing. The majority of the members strongly object to the way in which the club has been drawn into the discussion, while the Automobile Club of Italy has officially announced that it has nothing to do with the manifesto of the president of the Milan club, nor is it disposed to take any stand one way or another. The national club will do what is best for the interests of the industry, and it will certainly authorize the holding of the Brescia race next year, for which Chevalier Florio will offer a prize of $60,000, as well as the big touring trial if the Milan club deems it advisable to carry it out. A similar prize has been promised for the touring trial, and the Milan club is said to be doing things on a big scale so as to cut out the Florio Cup, though for what reason it is difficult to say. Obviously there is a good deal of jealousy and political influence at work on the other side of the Alps.

The president of the Milan club has made himself something of a laughing stock by the way in which he hastened to inform the world that Mr. James Gordon Bennett had handed over his trophy to be competed for in the touring trial. Mr. Bennett was dining at his hotel when he was informed that a deputation of the Automobile Club of Milan was waiting to see him. On asking what they wanted, he was told that the deputation wished to ask him if he would allow his cup to be put up for their touring competition. He replied: "They can do what they like with it; it doesn't belong to me." They took the first part of the answer as a consent, and thus for some days it was understood that the Bennett Cup would be competed for by touring cars in Italy.

Although the president of the Milan club may feel himself very disappointed, it does not follow that the Bennett Cup will not have a new destination. There is an influential section in the French club, with the Marquis De Dion at its head, who would like to see the cup devoted to a big endurance test of touring cars, and this question will certainly be discussed at the conference to be held in Paris during December, when we shall doubtless be fixed upon the various questions affecting the future of the sport.

This conference will divert a good deal of attention to Paris during the show, as also will the congress on international touring, which it is hoped will do a good deal in the way of facilitating the travels of motorists, as well as in securing a uniformity in regulations and in other ways looking after the requirements of motor car owners. So far as France is concerned, there is a threat of much more stringent regulations as the result of the fatal accident which recently happened to a high government official whose cab came into collision with a motor car. Had it been Mr. Jones or Mr. Smith no notice would have been taken of it, but the death of a big official is a handy peg upon which to hang an anti-motoring crusade by those members of Parliament who can find no other means of making themselves heard.

Fortunately, those who are responsible for the regulations are too level headed to do anything that may interfere with such a flourishing industry as the manufacture of motor cars, and the Prefect of Police in Paris therefore simply proposes to enforce some of the regulations with more stringency, especially in the granting of driving certificates. It is argued that there is something absurd in allowing any man to drive a high powered car simply because he is able to show an inspector that he can steer and brake and reverse and knows the rules of the road. Therefore, a man who aspires to the honor of driving a powerful car will have to pass through a very severe examination to prove his aptitude, at the same time that an inquiry will be made into his antecedents to see if he is a person capable of being intrusted with a car, and he will also have to undergo a medical examination to prove his physical fitness. If this be done, the ranks of drivers who show off on powerful cars will be considerably thinned.

To Tour into Turkey.

By express permission of his Sultanic majesty the automobile will shortly invade the realm of the Turk. R. L. Jefferson, an Englishman, recently started in an 8 horsepower single cylinder Rover car on a journey across Europe to Constantinople. The only feature in which the engine differs from others of its type is in being fitted with an inlet valve lifter, which permits of its being used as a brake in running downhill. Owing to the nature of the country to be traversed the entire tonneau has been transformed into a multum in parvo of supplies and replacement parts.

Buy 'Buses to Meet Strikes.

Automobiles have been found so serviceable in times of strikes that the Amalgamated Association of Street and Electric Railway Employes voted in convention yesterday that the executive board be authorized to invest $20,000 in automobile buses, to be held as the property of the union.

During a recent strike of streetcar men at Saginaw, Mich., the association bought three automobile buses and shipped them to Saginaw, where the strikers put them in operation to accommodate the public while the streetcars were tied up. They were shipped to Detroit, where they are in reach of any local union that has a strike and wishes to operate the machines in opposition to streetcar companies employing non-union men.

New Jersey Clubs Nominate Scarritt.

The nominating committee of the recently organized Associated Automobile Clubs of New Jersey has made up the following ticket, which will be voted upon at a special meeting this week: For first vice-president, Winthrop E. Scarritt, of East Orange, a member of the Automobile Club of New Jersey; second vice-president, George A. Post, of Paterson, representing the North Jersey Automobile Club; secretary, W. F. Sadler, Jr., of Trenton, of the Mercer County Automobile Club; treasurer, Frank M. Eveland, of Jersey City, of the Hudson County Automobile Club. The nominations for trustees are W. B. Hunter, of East Orange, Automobile Club of New Jersey; W. J. Morgan and J. H. Wood, Newark, New Jersey Automobile and Motor Club; W. G. Norwood, Paterson, North Jersey Automobile Club; J. H. Edwards, Jersey City, Hudson County Automobile Club; Walter E. Edge, Atlantic City, Atlantic City Automobile Club; F. G. Roebling, Trenton, Mercer County Automobile Club; W. N. G. Clark, Asbury Park, Monmouth Automobile Club, and Senator Lewis M. Cresse, Cape May, Cape May Automobile Club.

How He Fooled the Farmer.

According to a tale that comes from the Badger State, a Racine motorist neatly punished a granger for his ill will. The road was narrow, and the farmer refused to let the chauffeur pass, the farmer walking his horses for several miles. Finally the car got by, but stopped short in front of the farmer and his team.

"Get out of the way and let me pass!" yelled the granger.

"Sorry I can't oblige you," replied the chauffeur, "but the machine has broken down."

After fuming and swearing for half an hour the farmer volunteered to help push the car out of the way. He pushed and perspired, grunted and swore, but could not budge the machine an inch. When the driver considered the farmer well punished he released the brake and was soon out of sight up the road.

Massachusetts Has a Nut to Crack.

Though the selectmen have closed certain streets in South Framingham, Mass., and their ruling has been upheld by the Massachusetts State Highway Commission, there is one man who has yet not been molested. He is W. R. Hurlbutt, a rural free delivery carrier, who uses an automobile to deliver the mail. The local authorities are now claiming that Hurlbutt also should be prohibited from using the forbidden streets, but as he questions their authority to stop a carrier employed by Uncle Sam, they hesitate to stop him. In the mean time, while waiting for an opinion from a higher source, Hurlbutt is still delivering the mail by automobile.

LEAKS IN COOLING SYSTEM

Some of the Things that Cause Them and How Repairs May be Effected

One of the weak points in the water cooling system for gasolene motors is the danger of leakage and the difficulty of locating and repairing such faults. The impossibility of preventing a certain amount of working of the parts when the machine is on the road is largely responsible for this, and it is a flaw which is not easily to be eradicated. To get rid of the difficulties which arise from this source it is customary to use flexible connections between the radiator and the motor and between the motor and the tank, where that is not incorporated in the former. These, being commonly of ordinary rubber tubing, are a source of frequent trouble from their own tendency to rot under the action of oils and grease which are continually flying about when the motor is in action.

When it becomes necessary to break such a joint for any reason, it is found to be almost impossible to make it tight again without putting considerable tension on the grips which hold it in place, and even after taking the greatest pains to secure a perfect union there will often be a slight leak for a time until the rubber has settled into shape. After rubber has been in service for a time it becomes hard and stiff and loses its flexibility to a certain extent, thus failing of its purpose, and the result is that the piping is racked at every turn of the motor almost as much as it would be were there no provision made to avoid the effect.

A very good substitute for the simple rubber, which happily is finding its way into more and more common use, is the flexible metallic tubing, which has the advantage of making a perfect union possible as well as being water tight and strong at all times. It cannot readily be substituted for the plain tubing on a machine, since it requires flanged connections, but even although rather expensive in point of the cost of installation, it frequently pays well to effect the change and set it up on a car which has not been equipped with it in the first place.

Aside from the leakages which occur from the straining of the joints due to the imperfect action of the flexible joints, a rather common source of trouble is from stones which are thrown up from the wheels on the road. Accidents from this source, however, cannot be forestalled, and must be treated as occasion demands. Frequently the radiator suffers considerably from this cause, a very considerable leak being caused by a small pebble cast up on a turn.

The location of small leaks is very difficult, especially when they are so small that they only permit a slight seepage of water which flows along the outside of the pipe or radiator to its lowest point where it forms in drops. A very good method of detecting such leaks is to fill the system with low pressure steam, first having drained off all the water and plugged up the overflow, the faulty points then being readily distinguished by a tiny jet of escaping vapor. To apply this test it is only necessary to make a temporary connection with a steam radiator or with a pipe fitted with a reducing valve. Another method which is sometimes recommended is to blow smoke through the system, the result being the same.

The repair of small leaks depends, of course, upon the location and nature of the trouble. A leaky joint comes often enough from a bent or cracked flange in some coupling, and is only to be permanently repaired by reflanging the faulty part. Piping which is cracked may be repaired by brazing or by soldering with a blow torch, and, of course, leaks in the radiator are to be repaired by soldering, but the work is ticklish, owing to the nature of the structure, and should not be undertaken by one who is not expert in the use of the torch and the soldering iron.

It is generally possible to repair small leaks on the road by means of tire tape, in connection with that nauseous plastic substance chewing gum, but it is not wise to depend too strongly upon a repair so made as it is not trustworthy. It is far better to insert a handful of bran or even common sawdust into the filling tube, whence it will seek out the leak and plug it with astonishing rapidity, and form a solid repair which will last for weeks and even for a whole season under some conditions.

It is well to flush out the cooling system once in every three or four hundred miles on the road, thus ridding it of any accumulated silt, and at the time it is being done it is well to look over the connections to see that they are not leaking and that the pump is in order. On a well arranged car it is a comparatively simple matter to keep the cooling system in perfect order, repairing small leaks as fast as they develop and taking care to do a permanent job in every case. Unless this is done, however, there is every likelihood that trouble will come when least expected, and that it wil be of a serious nature, for when the piping is partially stopped up with sediment and the joints are not perfectly tight, even a slight amount of damage may seriously interfere with its work.

It is probably needless to suggest, too, that after a season's running, and before the machine is prepared for the winter, it is essential that all leaks be gotten rid of so that there shall be no loss of the precious antifreezing solution which is to be put into it later on, and probably, too, at a time when to lay up the machine for a day or so to go over it would be a serious loss of the glorious riding weather of the late fall.

A brilliant Englishman has devised a system of mirrors, by means of which the driver of a car has a beam of light reflected into his eye from the tail light at all times, thereby enabling him to make certain that the flame has not been snuffed out. Incidentally, the beam is made to cover the section over which the gear shifting lever works, thus enabling him to see clearly in what position the gears are placed before making a change.

ABOUT THE MOTOR OMNIBUS

What it Costs to Operate it and Wherein it Surpasses the Street Car.

As a result of the intense rivalry which has been engendered in England over the adoption of the motor 'bus in localities which up to the present time have been monopolized by the electric tram lines, a considerable controversy has arisen over the respective costs of operation of the two modes of transportation, and a battle of statistics is in progress. United States Consul Mahin, of Nottingham, in a recent report to Washington, takes up the matter for a second time, and corrects certain assumptions which he had formerly made, in consequence of a storm of protest which the first text had created, at the same time admitting that he had drawn his conclusions from the somewhat unsatisfactory basis of newspaper statements.

The costs of operating vehicles of the two classes, which had been given as 24 cents per ton mile in the case of the trams and 80 cents per tone mile in the case of the motor 'buses, are recognized as being totally incomparable, because of the difference in the seating capacity of the two, the tram cars carrying from fifty to seventy passengers, and the 'buses taking from twelve to thirty-six, and even forty in the very latest types.

Comparing the analagous costs of tire upkeep and maintenance of way in the two cases, he gives the former as something like 16.10 cents per mile, including all contingent expenses, while the latter amounts to 14.56 cents per mile, or a trifle less. The difference in cost should, however, decrease, as time goes on, as "improvements, organization and increased knowledge" are reducing the factors which now create the chief points of divergence.

Discussing the general advantages of the motor omnibus as compared with the tram line, he says:

"If every pertinent consideration is given fair weight, it is but little more expensive to operate at the present moment than the tram car, and its comparative newness leaves room for improvements which will sensibly reduce its working expense. It is practically unassailable in congested city streets. In towns having a population of below 150,000 the motor omnibus can, generally speaking, be operated more profitably than a tramway, because the size of the population will not warrant the running of a sufficient number of tram car miles per mile of track to yield a return on the heavy capital investment. It can change its route at will to accommodate passing demands. It serves as traction for perishable market supplies. It fills gaps on rural routes or it extends facilities similar to those of steam railways. In these various respects the motor omnibus is unique."

C. L. Scrivens, the Ashtabula (Ohio) dealer, has leased the old armory building in that city and will convert it into a garage. Scrivens expects to move from his present Main street location before January 1.

SURFACE CARBURETTERS AGAIN?

Advent of Mechanical Valves Suggests They Were Discarded Without Sufficient Trial.

During the trials of carburetters, held in the early part of the year by the Automobile Club of France, many experiments were made which point to the fact that some foreign engineers do not seem to be satisfied with the modern spray carburetter, even when fitted with automatic devices for controlling the mixture and making it of uniform strength, however much the engine speed may vary.

According to M. Lumet, the engineer in charge of the laboratory of the Automobile Club of France: "In order to obtain a homogeneous carburetted mixture, long lengths of induction pipe have been used in connection with wick carburetters, but it is found that the friction of the mixture in passing along the pipe causes the motor to lose power. Experiments showed that a 10 horsepower motor lost 10 per cent in power when a heated pipe four inches in length was added to an induction pipe already of a fair length.

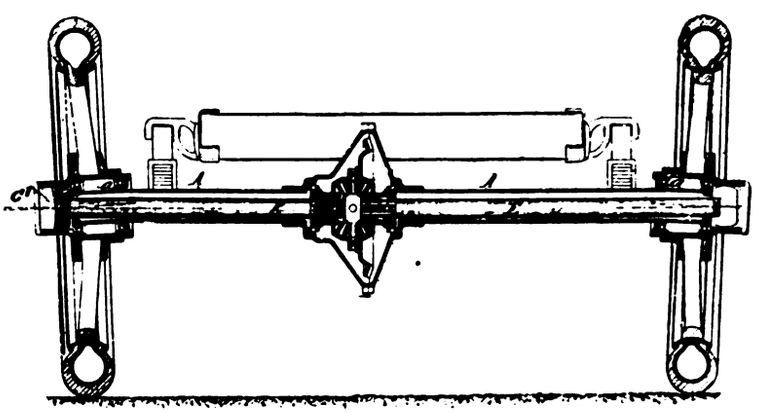
"The old type of carburetter was of the wick variety. This was superseded by the float feed jet type, where a spray of gasolene is sucked up and carried into the cylinder in the form of vapor.

"The partial vacuum caused by the suction of the piston causes a spray of gasolene to rise from the jet. The more violent the suction the larger is the volume of the spray induced. For this reason a motor turning quickly induces a spray or jet of large volume and the mixture delivered to it is consequently much richer in gasolene than when the motor turns slowly. There is, therefore, no constancy in the mixture, as the motor is always varying in speed. In order to obtain the best results in a motor the contrary should obtain, and the slower the speed the richer should the mixture be in order to make up by richness for the lack of compression.

"With the introduction of mechanically operated inlet valves comes the necessity of providing a constant mixture, and constructors are already returning to the old type of wick carburetters, which expose to the inrushing air a surface saturated with liquid gasolene in place of the jet."

One of the few firms abroad that have remained steadfast to the surface carburetter, after all other builders had discarded it in favor of the float feed automatic type, are the constructors of the Delahaye cars, and now that, as in the case of the low tension magneto, some engineers have come to the conclusion that the surface carburetter was dropped without sufficient trial, a description of this will be of interest.

It consists of a chamber or receptacle for the fuel, and is, of course, considerably more bulky in all its parts than the float feed type, this being considered one of the great advantages of the latter. Warm air is led from a space in the cylinder jacket through a pipe terminating below the gasolene level in this receptable, the latter end of it being pierced with a number of holes. Surrounding the intake pipe is a funnel shaped device and a number of baffle plates to prevent the liquid from splashing about. The entire upper part of the chamber constitutes a reservoir for the storage of the explosive mixture, from which it is drawn into the cylinder.



This type of carburetter was used steadily for several years on the Delahaye two cylinder cars, but when its adoption for four cylinder motors was attempted it was found that its size would be prohibitive, in addition to which it is not so well adapted to the needs of the multiple cylinder motor, as the latter requires a constant stream of fuel,

Axle that Permits of Staggered Wheels.

Despite the existence of the thousand and one more or less complicated devices for preventing a car skidding on the road, some of which are on the market and more are not, nothing has been found so effective as giving the wheels a bit of stagger—that is, setting their axes so that they run slightly out of the perpendicular, with the inclination inward. This permits the tire to grip the road when the car tends to slide sidewise from whatever cause, and has been proved to constitute a better preventive than anything yet devised.

No difficulty presents itself in the application of this form in mounting the front wheels, but in the case of live axle drive it is a different matter with the rear wheels. In many it is impossible to obtain this flare because the two parts of the real live axle which extend from each side of the differential are journalled or provided with bearings in the cylindrical casing, which is fast to the gear box and rigidly sprung. This construction renders impossible the obtaining of even a slight amount of flare or stagger, inasmuch as the wheel is fixed to the journalled axle and can only be at right angles thereto.

A form of rear axle construction designed to overcome this and permit of the rear wheel being given the same or almost as much stagger as the front ones has been devised. It is illustrated sectionally in the accompanying line drawing. A represents the customary tube, or casing, which constitutes the support and container for the moving axle. This is formed of two pieces, terminating in the differential casing, and carries at its outer extremities the parts aa, slightly inclined relatively to A, in such a manner that the axes, Y, of these blocks make a slight angle with the axis of the live axle itself. Upon these inclined extremities are mounted the road wheels, running on ball or roller bearings in the usual manner. The two portions of the live axle, EE, are slightly longer than the tube A, and extend beyond it without making contact at any point and without the use of bearing rings. The ends of the live axle are connected to the road wheels by means of a Cardan joint or similar articulated device that permits of the angular connection. In the drawing the connection consists of the spherical segment F centred in the cap C and having upon its bases two slots, or notches, at right angles to one another. With one of the latter there engages

the T shaped head or end of the axle, and with the other there engages a web belonging to the cap of the wheel hub.

What the Backwoodsman Wanted.

A prominent automobile manufacturer is alleged to have received the following communication from a Canadian backwoodsman who wanted to open an agency:

"I vont fayndant bat dis passinger Coach and bat touring Car I gon bay von ovdis kayn i layk dem val befor nekst spring i vond von anuvey, and nadr man her vond von cip con chip az keu seld or some sekind hend.

"ve vond picen avdovet and prais-list."

Which is supposed to mean:

"I want to find out about passenger coaches and touring cars. I am going to buy one of this kind. I like them well, before next spring; I want one anyway, and another man here wants one cheap, as cheap as can be sold, or second-hand. We want pictures and price-list."

It is said that a blacksmith in Winnipeg Canada, has discovered a process of welding copper which is as successful as it is simple and inexpensive. The report states that by this process copper may be welded to copper or to any other metal without injuring its electrical conductivity or in any way impairing its other properties. It is a great pity that Winnipeg is so far away.

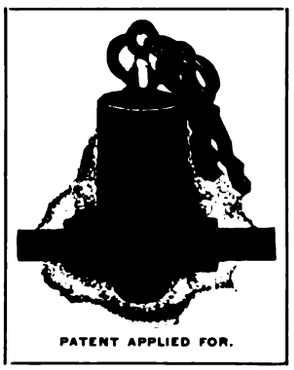
Parts for 1906 Automobiles:

For the convenience and assistance of automobile builders we have prepared complete drawings of our 1906 model pressed steel frames and frame members, and other parts, which will be mailed upon application. We are prepared to build pressed steel frames, change gears, front and rear axles and other parts in any quantity for early delivery.

STEEL STAMPINGS:

We make a specialty of steel stampings of all descriptions, including hubs, parts, brake drums, etc.

STEERING WHEELS:



Another specialty of ours—we make the best steering wheel rim on the market, and a large variety of spiders for application to any steering column.

Send for our Steering Wheel circular

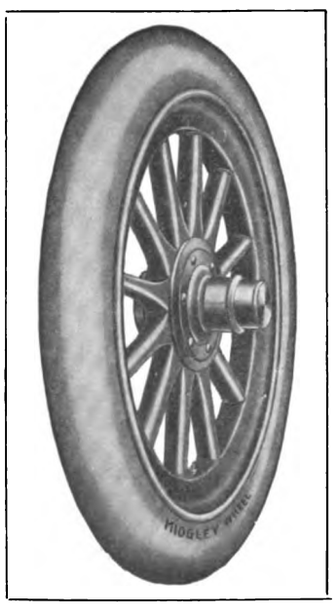
No More Borrowing Cars Without Owner's Permission



The Hill Lock Valve

(here shown), is a new device and a good one. It is connected at any convenient place in the gasolene pipe and when locked and the key withdrawn prevents the gasolene from flowing to the carburettor and consequently the engine cannot be started. The key cannot be taken from the lock until the gasolene supply is entirely shut off—when shut off keep the key in your pocket. Impossible for anyone to steal your car. Your fuel supply is **locked,** but your car can be pushed to the wash-stand for cleaning, or into the street in case of fire. It is a small device made entirely of brass and turned with a "special key"—no two keys are alike. The lock is of the finest grade, it has five tumblers and cannot be picked or opened without the "right" key. Three keys are furnished with each lock. The locks are perfectly tight, being tested by gasolene under a pressure of one hundred pounds. It is made for all sizes of pipe from the smallest motor-cycle or launch to the most powerful touring car. Price, $5.00. **Special price to Supply Houses and Automobile Manufacturers.** Apply to your supplyman or garage. If not found in stock, address

The Expected Revolution Has Come!

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found he only good reason why you should *not* buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the *two* cycle two cylinder Elmore engine.

Understand—the *two* cycle two cylinder Elmore engine produces *two impulses every time the fly-wheel turns.*

As you know, the two cylinder *four* cycle furnishes only *one* impulse every *fourth* time the fly-wheel turns.

In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time n finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

New Idea in Spring Damping.

An English inventor has approached the spring damping problem from a new standpoint in contriving an arrangement by means of which the suspension is divided between two sets of springs, the one carrying the load ordinarily and the other opposing the upward motion of the body on the rebound following a shock. The arrangement is that of two axles, one carrying the wheels, and having the main springs mounted upon it, and the other being supplied with a set of supplementary springs, so constructed that they do not synchronize with the first. Besides these, there is a set of secondary springs mounted in such a manner as to counteract the tendency to upward motion. The effect of the combination is to neutralize all shocks, the vibrations of the different springs being absorbed in one another in such a way as to have but little effect upon the occupants of the machine.

Using the Teeth to Locate Knocks.

When it is desired to locate a knock in the mechanism which is not readily distinguishable to the ear, it is frequently advisable to use a sounding rod, a piece of stiff wire, as, for instance, a bicycle spoke serving to best advantage, one end of it being pressed against some accessible stationary part and the other held between the teeth, the ears being stopped up with the fingers at the same time. In this way the vibrations which take place within are communicated to the rod, and through it to the teeth and the ear drums, while all external sounds which tend to confuse the listener are excluded. By this method it is often possible to locate with absolute precision a loose part the sound of which otherwise so blends with the other noises of the machine that it is only significant that something is amiss, but is capable of no further interpretation.

Concerning Cars that Smoke.

A great hue and cry is being raised in England and on the Continent over the prevailing tendency of gasolene motors to emit considerable volumes of thick noxious smoke. In this country the trouble is less noticeable because of the fact that many of the cars in use will not run well under conditions of excessive lubrication, but it is a fact that the number of smoky cars seen on the streets is daily increasing. In many such cases the smoke is quite inexcusable, the action of the motor being fully as good with a less amount of oil than when the cylinders are flooded. In others, where the best results are obtained by flooding the mechanism, it is to be expected, but it is by no means necessary.

The excuse often given that the method of throttle control, by increasing the vacuum in the cylinder sucks the oil up by the piston, seems hardly rational, as the joint between the cylinders and pistons is so tight that there is little or no opportunity for the lubricant to actually flow through it, that which actually reaches the combustion chamber being in the form of a film on the walls, which is partially scraped off by the rings on the downward stroke. This amount is not at all likely to be affected in any way by the method of control.

The Grafter in New Guise.

Chicago has a new kind of grafter, says the Inter Ocean, and advises garage keepers to "look out for the man representing himself as proprietor of a country hotel who is apparently anxious to purchase an automobile. He is out to see the city at the expense of the agent under the guise of being a prospective customer. Last week this individual visited the Hayden Automobile Co., and, after talking figures and looking over specifications with Thomas Hay, the local agent, stated that he would like to have a demonstration. Mr. Hay drove him out to Washington Park, explaining the mechanism en route and also showing him how to operate the machine.

" 'This car is perfectly satisfactory,' stated the prospective buyer. 'It will fully answer the purpose for which I wish to buy it. I shall use it to take my guests to and from the railroad station to the hotel, and will also rent it for pleasure purposes. If you will take a pencil I will dictate a telegram to my brother.'

"The telegram instructed the alleged brother to send the amount necessary to cover the cost of the car. It was sent collect and returned, as the brother proved to be a myth. Mr. Hay is now looking for the man, although he is thankful that he did not take his gold watch or diamond scarfpin."

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau Street, New York.

HEALTH FOR YOU

WHY

PREMIER CARS

Appeal to All Classes.

TO THE PROFESSIONAL MAN—Because of its simplicity.

TO THE BUSINESS MAN—Because of its readiness to go at all times.

TO THE REPAIR MAN—Because of its perfect accessibility to working parts.

TO ALL MEN—Because of its low cost of fuel and maintenance.

We have much data from drivers on this latter point; for instance, one writes us: "The total cost of my running this season—5000 recorded miles—is only a trifle over one cent per mile for the car—or 1-5th to 1-4 cent per mile per passenger—total for repairs, fuel, etc., excepting tires."

These are points to remember when purchasing a car.

"The air cooled season never ends."

Side Entrance Model - $1500 Runabout - $1250

The Week's Patents.

800,418. Circuit Controller for Explosion Engines. Richard Varley, Englewood, N. J., assignor to The Autocoil Company, a corporation of New Jersey. Filed February 8, 1905. Serial No. 244,719.

Claim.—1. A circuit controller for explosive engines, comprising a circuit closer and a circuit opener, with means for simultaneously shifting both of them so that the instant at which they shall be actuated in the cycle of the engine may be altered, in combination with means for shifting the circuit opener independently of the circuit closer, and simultaneously altering the speed of the engine.

800,497. Fly Wheel and Crank Shaft Structure. Stanley W. Shaw, Galesburg, Kan. Filed March 30, 1904. Serial No. 200,668.

Claim.—1. The combination of alined crank shaft sections, disks carried at the contiguous ends thereof, the disks being concentric to the shaft sections, a wrist pin extending between the disks eccentrically to the crank shaft sections, said shaft sections, disks and wrist pins being integral, and two annular flywheel sections fastened respectively to the peripheral portions of the disks and spaced from each other to permit a connecting rod passing between the flywheel sections.

800,564. Clutch. Linzy E. Gibson, Kokomo, Ind. Filed March 18, 1905. Serial No. 250,848.

Claim.—1. A clutch, including a slidable clutch member, a toggle lever having one end fixed and its other end connected to the slidable clutch member, a controlling slide working in frictional engagement with the toggle lever to move the clutch member forwardly, and a spring operating upon the toggle lever in opposition to the slide.

800,572. Automatic backstop for Motor Cars. William B. Hayden, New York, N. Y. Filed May 31, 1905. Serial No. 263,067.

Claim.—1. An automatic backstop for vehicles, comprising a band having one inner face provided with a plurality of grooves, a stationary support, an eccentrically mounted toggle on said support, provided with a plurality of teeth corresponding to the grooves in said band, a spring connection between the toggle and the support for retaining the toggle against the band, and means for shifting the toggle from its engagement with the band.

800,603. Magnetic Clutch Mechanism. Harry A. Williams, Akron, Ohio, assignor to The Williams Electric Machine Company, Akron, Ohio. Filed February 14, 1905. Serial No. 245,577.

Claim.—1. A shaft, a loose pulley thereon, a driving member rotatable with the shaft, a fixed support for the shaft, a loosely supported rotatable member, means for frictional engagement between said loosely-supported member and pulley, combined with a magnetic clutch, and electrical connections whereby said clutch is energized to actuate the frictional means for driving the pulley.

800,614. Governing Device for Explosive Motors. James R. Hubbard, Chicago, Ill. Filed June 20, 1904. Serial No. 213,248.

Claim.—1. In an explosive motor, in combination with the gas inlet valve, an auxiliary cylinder and piston therein connected with the gas inlet valve, the connections being proportioned for multiplying the movement with the inlet valve, in opening, transmits to the auxiliary piston, said auxiliary cylinder having beyond the piston a restricted air inlet, and a check valve opening outward for free outlet.

800,625. Induction Coil for Igniting Explosion Motors. Jules Carpentier, Paris, France. Filed February 8, 1905. Serial No. 244,757.

Claim.—1. In an induction coil, the combination with the armature of the interrupter of an electromagnet having two windings serving to operate the armature, the one winding being of thick wire and being adapted to have the main current pass through it, while the other winding is of thin wire and has a shunt of the main current passed through it, substantially as and for the purpose described.

800,638. Storage Battery. William Gardiner, Chicago, Ill., assignor, by mesne assignments, of one hundred and fifty-two two-thousandths to Universal Electric Storage Battery Company, Chicago, Ill., a corporation of Delaware. Filed June 11, 1904. Serial No. 212,135.

Claim.—1. A storage battery plate comprising a lead grid having cross pieces each formed with longitudinally extending top and bottom offsets facing in opposite directions, and suitable material to become active held in the recesses formed between the said cross pieces, the top and bottom surfaces of said cross piece extending horizontally from one face of the plate to the other, the said offset surfaces being vertical and at right angles to said horizontal surfaces, said horizontal portions of the grid having comparatively thin and straight unbroken outer edges, whereby the opposite surfaces of the plate, when in use, present a maximum of active surface and a minimum of inactive surface.

800,640. Elastic Tire for Vehicle Wheels. Henri Gilardoni and Henri Le Riche, Paris, France. Filed March 16, 1905. Serial No. 250,459.

Claim.—1. A wheel tire with a warp of textile threads and a weft of elastic elements the ends of which are bent back in order that they may hook into the edges of the wheel rim, in combination with a ring within the tire at the periphery of the wheel to serve as a stop for limiting the flattening of the tire when submitted to undue exterior pressure, the said stop constituting the rim itself, and a counter rim serving in combination with the other rim to retain the hooked edges.

800,647. Carbureter. William A. Hatcher, Cleveland, Ohio, assignor to the Brew-Hatcher Company, Cleveland, Ohio, a corporation of Ohio. Filed February 23, 1905. Serial No. 246,934.

Claim.—1. In a carbureter, the combination, with a passageway for feeding a combustible aeriform mixture into the cylinder of an internal combustion engine, of an air chamber having an air inlet and arranged a suitable distance below the aforesaid passageway; a mixing chamber located between the air chamber and the said passageway and arranged to discharge into the said passageway; means for controlling the discharge of the combustible mixture from the mixing chamber to the said passageway; an oil conducting pipe arranged centrally of the air chamber and discharging into the mixing chamber, which pipe is externally screw-threaded at its lower end and screwed into the bottom of the air chamber; means for supplying oil to the last mentioned passageway; a valve for regulating the discharge of oil from the said pipe, and several suitably supported flap valves normally covering the air chamber and arranged to be swung into the mixing chamber by suction created within the mixing chamber.

800,659. Gas or Gasolene Engine. Ernest H. Korsmeyer, Rosedale, Kans. Filed July 20, 1903. Serial No. 166,274.

Claim.—1. In a motor, the combination with a cylinder and a piston therein, of a casing secured thereto and provided with an open end half journals located at the open end of the casing, a second casing, half journals located on the second casing and adapted to register with the journals at the open end of the first named casing, the last named casing secured to and closing the open end of the first named casing, shafts received in the journals formed by the juncture of the casings, gearings secured upon the shaft within the casings and means connecting the piston and gearings to actuate the former.

800,684. Rotary Hydrocarbon Engine. William E. Schneider, Washington, D. C. Filed October 12, 1903. Serial No. 176,720.

Claim.—1. A motor having a casing, a cylindrical piston mounted to revolve therein and provided with a tangential chamber open at the periphery, means for introducing an explosive charge into said chamber at one point of the revolution of the piston, and means for exploding the charge at another point of said revolution, substantially as set forth.

800,732. Power Transmission Mechanism. Christian Forthun, Oak Dale, Iowa, and Martin Forthun, Leroy, Minn. Filed June 1, 1905. Serial No. 263,303.

Claim.—The combination with a reciprocating rod 1, of a shaft 3, a wide faced ratchet wheel 5 on said shaft, a pair of bifurcated levers 12 pivoted on said shaft 3 and embracing said ratchet wheel, a pair of spring pressed driving pawls 16 pivoted to the outer portion of said levers 12 and engaging the teeth of said ratchet wheel 5, one member of each pair of pawls being longer than the other, and the links 17 pivotally connecting the outer portion of said levers 12 to the said reciprocating rod 1, substantially as described.

800,770. Gas Engine. Alfred Steinbart, Carlstadt, N. J. Filed February 20, 1904. Serial No. 194,514.

Claim.—1. A gas engine constructed with two cylinders having direct end communication at both ends of the cylinders, of a piston in each cylinder, a piston rod on each piston permanently at right angles thereto, a connecting rod connected with each piston rod, a cross head for each piston rod, a main shaft having a crank, with which crank the connecting rod of both piston rods are connected, substantially as set forth.

800,777. Carbureter and Vaporizer for Explosion Engines. Alfred Westmacott, St. Helens, Isle of Wight, England. Filed May 8, 1905. Serial No. 259,351.

Claim.—1. In a carbureter and vaporizer, the combination of a case or chamber, a group of tubes mounted in removable tube plates made tight with said casing, an inlet in the side of the casing between the tube plates adapted to be connected with the exhaust port of a motor, an outlet from the casing between said tube plates, an oil and air freed device beneath the lower tube plate, an outlet from the casing above the upper tube plate adapted to be connected with the induction port of the motor, a corresponding inlet fitted with an inwardly opening spring valve at the opposite side of the casing, an opening in the casing between the tube plates fitted with a shutter and designed for the introduction of the flame of a blow lamp and a platinum plate or shield within said

Digitized by Google

opening substantially as herein shown and described and for the purpose stated.

800,784. Cushioned Tire. Edward C. Bailey, Cromwell, Conn. Filed March 23, 1905. Serial No. 251,619.

Claim.—A cushioned tire comprising an inner hoop which is convexed upon its inner surface and flat upon its outer face, the ends of said hoop overlapping and beveled and adapted to slide one over the other, an outer hoop with its outer face convexed and inner face flat, the ends of said outer hoop overlapping each other and fixed together, a series of cushions which are rectangular outlined in section, against which the inner flat faces of said hoops bear, and a covering surrounding the hoops and cushions, as set forth.

800,809. Pneumatic Tire Guard. Thomas H. Lindley, Cedar Rapids, Ia. Filed January 3, 1905. Serial No. 239,514.

Claim.—1. A guard for pneumatic tires, comprising a continuous metal band closely encircling the tire centrally, and keepers recessed outwardly to take said band, and inwardly conforming to the periphery of the tire in cross-section.

800,835. Vehicle Wheel. Frank A. Seiberling, Akron, Ohio. Filed March 9, 1905. Serial No. 249,242.

Claim.—1. In a vehicle wheel, the combination with a rim and a tire holder locking device, of a tire holder adapted to be engaged by said locking device, said tire holder consisting of an endless ring provided with a bearing surface to engage said rim, and with two outwardly inclined beveled bearing surfaces, both of which beveled surfaces conform in inclination to said locking device.

800,843. Controlling Device for Motor Vehicles. Victor E. Chamberlin, Indianapolis, Ind., assignor to Pope Manufacturing Company, Jersey City, N. J., a Corporation of New Jersey. Filed March 17, 1905. Serial No. 250,520.

Claim.—1. In a motor vehicle, the combination of a motor, a controller therefor comprising a plurality of groups of contacts and connections to determine the speed and direction of movement of the motor, a controller handle movable laterally and forward and backward, and a spring bearing upon said handle to retain it in a line for movement in a fore and aft direction and yielding to permit lateral movement, substantially as described.

800,864. Tire Armor. Jehu C. Moore, New York, N. Y. Filed October 28, 1904. Serial No. 230,364.

Claim.—1. A pneumatic tire, comprising an inner tube, a hollow outer tire having a flat, ungrooved tread, a protecting armor consisting of a thin, flat, endless flexible band of resilient metal extending about said tread, and means for securing said band in place, said means consisting of screw fastening devices which extend through the said outer tire to the hollow therein and are disposed along the middle of the width of the tire.

800,915. Mounting for Power Apparatus for Self-Propelled Vehicles. Edward R. Hewitt, New York, N. Y. Filed April 8, 1904. Serial No. 202,275.

Claim.—1. In a self-propelling vehicle, the combination with a main frame supported upon the axles, of a supplemental frame carrying substantially all of the power apparatus and pivoted to the main frame upon an axis approximately coincident with its centre of motion upon the main frame.

800,996. Internal Combustion Engine. Charles S. Drummond, London, England. Filed November 6, 1903. Serial No. 180,011.

Claim.—1. In an explosion engine the combination of a working cylinder and piston, and three compressing chambers with pistons operated by the engine, one of said chambers compressing air for the working cinder, and two being in series for compressing fuel for said cylinder, said three chambers having pistons, two of which have compressing strokes on the working stroke of the working piston.

801,000. Automobile Steering Gear. William Y. Gambee, New York, N. Y. Filed February 4, 1905. Serial No. 244,121.

Claim.—1. In a vehicle steering gear, two armed levers secured to the wheel spindles, a four armed lever pivoted intermediate said spindle levers, a connection between each end of said spindle levers and corresponding ends of two arms of said intermediate lever, and steering gear for turning said intermediate lever connected to the other two arms thereof.

801,044. Carbureter for Hydrocarbon Engines. Charles W. Parsons, Toledo, Ohio. Filed February 4, 1905. Serial No. 244,095.

Claim.—1. In a carbureter, a reservoir for hydrocarbon liquid, an air inlet at one end thereof, a vapor outlet at the other end, a plurality of transverse partitions of absorbent material partially submerged in the liquid in the reservoir, and a curved partition of absorbent material adjacent to the vapor outlet, substantially as described.

801,097. Variable Speed Gear. Charles M.

PENNSYLVANIA CLINCHER

The value of a Tire is measured not by dollars, but by the Odometer.

The Tire which travels furthest without repairs is the most valuable to you.

The Tire which carries your Car softly over the road is the most valuable to your Motor.

PENNSYLVANIA RUBBER CO.
JEANNETTE, PA.

Digitized by Google

manly, Washington, D. C. Filed March 17, 1904. Serial No. 198,616.

Claim.—1. A variable speed gear comprising a driving element, consisting of multiple stationary cylinders, co-operating pistons and a crank acting as a pump, a driven element consisting of multiple stationary cylinders, co-operating pistons and a crank acting as a motor, a fluid connection between the pump and motor, and means for altering the relative capacities of the pump and motor, substantially as described.

801,115. Anti-Slipping Device for Tires. William J. Smith, Canastota, N. Y. Filed May 15, 1905. Serial No. 260,481.

Claim.—1. An anti-slipping device for tires comprising, in combination with a vehicle rim, clips engaging said rim, snap hooks detachably held to the ends of said clips upon opposite sides of the rim, a chain having a zigzag course in contact with the tread of the tire and engaging said snap hooks alternately upon opposite sides of the rim, as set forth.

801,124. Friction Clutch. Fred S. Williams, Rome, N. Y. Filed December 12, 1903. Serial No. 184,960.

Claim.—1. In combination, a shaft, a loose sleeve mounted thereon and provided with screw threads, a clutching member carried by said sleeve, a fixed sleeve carried by the shaft, a flanged disk carried thereby and forming a second clutching member, a spring pressed disk carried by one of the members and movable into engagement with the other in advance of contact of the two members, radially movable nuts carried by said second clutching member, cam-levers engaging at one end with the said nuts, and a longitudinally movable cam-collar mounted on the fixed sleeve and operatively engaging said cam levers.

801,169. Speed Regulator for Explosion Engines. David F. Williams, Granville, N. Y., Assignor to Ruggles Machine Co., Poultney, Vt. Filed March 9, 1904. Serial No. 197,383.

Claim.—1. The combination in an explosion engine, of an exhaust valve, an exhaust valve rod, a guiding means for the crank shaft end of the rod, a crank shaft, a grooved cam carried by the crank shaft, a cam rod, a bracket adjustably secured to the exhaust valve rod and having an opening for the reception of the cam rod, a compression spring for forcing said cam rod against the cam, a balance wheel carried by the crank shaft, a grooved non-revoluble collar carried by the shaft at a point between the cam and balance wheel, brackets carried by the shaft at a point between the cam and balance wheel, brackets carried by the balance wheel, weighted governor arms having one end extending into the groove of the collar, a pair of ears projecting from the side of the collar at a point beyond the groove, a lever pivoted at a point intermediate of its length to the frame of the engine and having one end bifurcated and connected to the ears, said lever serving as a means for preventing rotative movement of the collar and receiving rocking movement from said collar, the opposite end of the lever being disposed in the path of movement of the crank shaft end of the exhaust valve rod, a leaf spring rigidly secured at one end to the engine frame and having its opposite end bearing against the lever, and an adjusting screw extending through a threaded opening in the frame and bearing on said spring to adjust the sensitiveness of the governor.

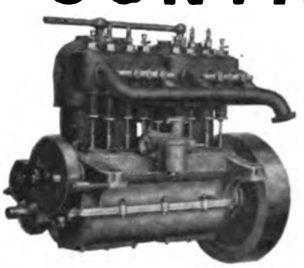
HILL PRECISION OILERS.

September 14, 1905.

THE STEEL BALL COMPANY,
840 Austin Avenue, Chicago, Ill.

Gentlemen:—In reply to your favor of the 12th inst., would say that Mr. Alexander Winton has always recognized lubrication as one of the most important problems to be solved by automobile manufacturers



It is safe to assume that the Winton Motor Carriage Company has devoted more time and experimenting to this feature than any other automobile manufacturing company in the country

For more than a year the Hill Precision Oiler has been subjected by Mr. Winton to the most exhaustive tests, both in our experimental department and also in exceedingly severe and prolonged road work. The most satisfactor results have been obtained, and as a result, believing it to be the most perfectly developed lubricating device yet produced. Winton cars will be equipped during the coming season with the Hill Precision Oiler.

Yours very truly,
THE WINTON MOTOR CARRIAGE CO.

There are reasons why

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

Reason 2
FABRIC.

¶ The several layers of Fabric are to a tire what steel girders are to a building—they give the tire its stability and resisting power.

¶ Morgan & Wright Tires contain only the highest grade of Sea Island cotton—a product that is known to possess extraordinary tensile strength.

☞ By a special method of incorporating this cotton fabric into the manufacture of our tires we greatly enhance its normal strength—a fact that partially explains the tremendous amount of hard usage MORGAN & WRIGHT tires are known to stand.

¶ High-grade fabric, properly used, also renders a tough cover stock doubly effective.

¶ All of which is but another good point in a thoroly good tire.

OF

CLINCHER TIRES

We have commenced and are vigorously prosecuting suits for infringement of our patents against the Pennsylvania Rubber Company and the Michelin Tire American Agency, Inc., on account of the sale of Clincher tires.

The sellers and users of infringing tires are equally liable with the manufacturers of such tires. Whatever rights we may have under our patents will be rigorously enforced. To escape liability purchases should be made from one of the following named manufacturers, who have the right to manufacture and sell G & J Tires:

G & J Tire Co.
Hartford Rubber Works Co.
Morgan & Wright.
B. F. Goodrich Co.
Diamond Rubber Co.
Goodyear Tire & Rubber Co.
Fisk Rubber Co.
International Automobile & Vehicle Tire Co.
Continental Caoutchouc Co.

Are You a Ford Agent for 1906?

If not, get the Agency for your territory. It will be worth your while. We do not care to announce particulars about our new models at this early date.

There's enough people copying Ford ideas and we want Ford Agents to have an exclusive snap next season. We can promise you, however, that the Ford proposition for next year will be the biggest money and reputation maker ever offered to an Automobile Agent.

You have heard the rumors about a "Ford runabout," but the most glowing accounts of our car will fall far short of the actual car we have for next year.

Write and get in touch with us.

HARTFO

1906 ANN

Pope-Hartford, Model F

Four Cylinder **20-25 H. P.,** **Price $2500.00**

It is conceded by every one that the POPE MANUFACTURING COMPANY has never had the reputation of making extravagant cla for its product. Generations of special training in the famous Factories of Hartford have developed mechanics who are masters of every fea of fine machine work and with the world's best mechanics and the best talent it is possible to procure we have by experimenting, trying, tes and improving, counting nothing too small to receive attention and nothing too great to be attempted, produced our new MODEL F which c not be excelled at anywhere near the price for quietness, speed and hill-climbing qualities.

Motor. jackets, developing under brake test 28-30 H. P. Valves l encased, the cylinders cast in pairs with integral heads and w Four-cylinder vertical water cooled engine with all gearsocated in the head all mechanically operated and interchangeable. Cy ders and pistons made of special stock and ground to a mirror finish thus insuring perfect compression. Crank shafts of special treated ni steel with liberal bearings. Crank case supplied with two large hand holes on the right hand side of the case through which every bearing the crank shaft is accessible.

Ignition. Jump spark, combined commutator and secondary distributor located between the second and third cylinders and driven f the cam shaft through a pair of spiral gears with a single coil controlled by a lever located on top of the steering wheel not revolving with the wheel.

Lubrication. The lubrication of the engine bearings and cylinders is from a special oiler located on the dash driven by a belt from cam shaft. The bearings of the transmission are provided with ring oilers running in individual wells at the ends of shaft, and the transmission gears, bevel gears and differentials run in oil. (The oiling of these parts is referred to more particularly u their special headings.) All parts of the car not lubricated in this way or by splash are provided with oil or grease cups wherever necessar

Transmission. The transmission is of the sliding gear type having three speeds ahead and reverse and is enclosed in an alumi case with an aluminum cover which is readily removed for inspection purposes. The gears are all made of spe steel hardened. The countershaft has three large bearings substantially bolted into the case and without any opening through the ends of case. All bearings are of special grade phosphor bronze and the gears and bearings with the exception of the front and rear main bearings immersed in oil, the front and rear bearings being lubricated from two oil wells in the bearing case, the oil being carried by a ring to shaft. The gears shift by a hand lever located on the right hand side of the seat, operating through a sector and pinions, a rack on the in of the gear case being directly connected with the sliding gears, the thrust at this point being taken up by a substantial ball thrust bearing.

Carburettor. The carburettor is of special design and of our own manufacture, very flexible and efficient running from 150 R. P. M 1600 R. P. M. and unrivalled in economy of fuel consumption. Carburettor throttle is controlled by a lever located on of steering wheel and not revolving with it.

Control. Controlling levers for ignition and throttle are located on top of the steering wheel engaging with a single sector arranged as not to revolve with the steering wheel. All gears changed by one lever located within easy access of the driver.

Drive. A compensating joint is located between the engine and transmission, and the drive from the transmission is through a lon tudinal or propellor shaft having universal joints at either end through a pinion and bevel gear to the rear axle. These joi are so arranged that all bearing surfaces are thoroughly lubricated at all times. All parts of the joints and shafts are made of special h carbon steel with liberal pins which work in removable phosphor bronze bearings.

Front Axle. The front axle is a solid forging of special steel having forked ends to receive the pivots. The axle is of exceptio strength and extremely graceful in design.

Rear Axle. The bevel gears driving the rear axle consist of a pinion meshing with a gear, both gear and pinion being made fr special steel, the pinion shaft being made integral with the pinion and runs in two Timkin roller bearings. The r axles proper or driving shafts have squared ends which fit square holes in the differential gears, insuring strong and durable constructi The shafts are securely keyed and locked at their outer ends in the wheel hubs and do not carry the weight of the car, but are solely po transmitters, the case and outer tube of the axle carrying the weight of the car. The thrust of the bevel driving gear is taken up by a la ball thrust bearing suitably backed up by hardened steel washers and supported by the main bearing of the case.

Steering. Steering mechanism consists of worm and sector enclosed in a case packed with graphite grease and is strictly irreversi Steering joints provided with spring buffers to relieve road shocks.

Brakes. The car is provided with two sets of brakes, one an external clamping band brake faced with camel's hair belting and acting o drum attached to transmission shaft directly at the rear of the transmission case. The other set consists of two inter band brakes, which are also faced with camel's hair belting and act in drums which are bolted to each rear wheel hub. The brakes are of ample proportion and of strong and powerful construction, either one of them being capable of locking the wheels with a very slight pr sure on the foot levers.

Frame. The frame is composed of armoured ash side pieces 1 5-16 by 4 inches at the centre. The armour consists of steel plates 3- inch thick securely bolted to the side pieces after all the riveting, which is done hot, is completed. The sub-frame wh carries the engine is made of channel steel securely riveted to steel cross members at either end.

Hood & Guards. Hood of improved design opening from both sides. Guards of special design, front guard large and flaring.

Body. The body is of new and graceful design seating five people, with non-removable dust-proof tonneau with double side entra especially easy of access.

Dash. This is of curved sheet steel reinforced with wood, finished in natural color and surmounted by a brass rail.

JNCEMENT

POPE Hartford AUTOMOBILES

Wheel Base. Wheel base is 98 inches and the tread 56 inches.

Wheels. 34 x 4 front and rear, with ball bearings of large dimensions.

Tires. We will adopt for our regular equipment what we determine to be the best tire on the market from actual tests we are now making.

Gasoline Capacity. 15 gallons.

Water Supply. 5 gallons.

Equipment. Full set of lamps, horn, tools and floor mats.

Pope-Hartford, Model C

Two Cylinder 18 H. P., Price $1600.00

Motor. Two-cylinder horizontal opposed, located cross-wise under the hood with integral heads and water jackets, developing under brake test 20-22 H. P. Automatic admission valve and mechanical exhaust. Cylinders and pistons made of special stock and ground to a mirror finish as in the Model F. Crank shaft of special treated nickel steel with bearings of liberal size.

Ignition. Jump spark from two sets of dry cell batteries carried under front seat.

Lubrication. Engine bearings and cylinders are lubricated by a special oiler located on dash driven by a belt from the cam shaft. The bearings of the transmission are provided with ring oilers running in individual wells at the ends of the shafts. The transmission gears, bevel gears and differentials run in oil. In addition to this there are oil and grease cups provided wherever necessary.

Transmission. The transmission is of the sliding gear type and identical with the transmission used on our Model F.

Carburettor. The carburettor is of entirely new design of the float feed type, very simple, very efficient and flexible.

Control. Spark and throttle levers located on top of steering wheel. All gears changed by one lever located within easy access of the driver.

Drive. The drive is through a longitudinal or propellor shaft having universal joints at either end through pinion and bevel gears to the rear axle.

Front Axle. The front axle is a solid forging of special design with forged yokes and exceptionally strong in all its parts.

Rear Axle. The rear wheel axle is of solid steel running on ball bearings in a tubular sleeve and of same style and construction as Model F.

Steering. Wheel operating through worm and sector. Strictly irreversible, joints provided with spring buffers to relieve road shocks.

Brakes. Two sets of brakes, one an external band brake acting on a drum attached to transmission shaft at rear of transmission case; the other set consists of two internal band brakes acting on drums bolted to each of the rear wheels.

Frame. The frame is composed of ash, armored with steel plates securely bolted after all riveting, which is done hot, is completed. The sub-frames and cross members are of steel, making a very strong and flexible frame.

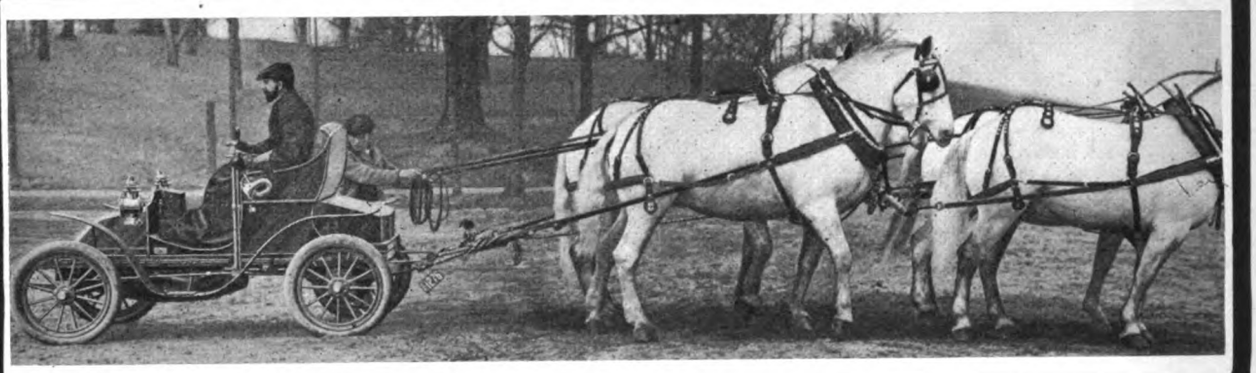
Hood & Guards. Of improved design constructed of steel, front guard large and flaring.

Body. Of graceful design seating five people, double side entrance type with non-detachable tonneau.

Wheel Base. 88 inch, tread 56 inch.

Wheels. 30 x 3½, front and rear, with ball bearings of large dimension.

Tires. We will adopt for our regular equipment what we determine to be the best tire on the market from actual tests we are now making.



Gasoline Capacity. 11½ gallons.

Water Supply. 4 gallons.

Equipment. Two side oil lamps, two head light brackets, full set of tools and floor mats.

Autocar Runabout (Type X) $900

The Power of this Runabout

The Autocar Runabout has a motor of 10 mechanical horse-power, which is about equivalent to 15 animal horse-power.

The horses, however, could furnish this power for only 8 hours a day. As the Autocar Runabout can be run for 24 hours a day, it will be seen that if both power and endurance are considered this car is equal to 45 horses.

This tremendous power, coupled to a car weighing only 1200 lbs., gives the Autocar Runabout great speed and hill-climbing ability and is one of the things that make it the most remarkable small car built.

The motor in the Autocar Runabout is of the two-cylinder horizontal opposed type. It is located in front under the hood, where it is instantly accessible. The transmission case may be reached by lifting the floor in front of the seat. This car has three forward speeds and reverse, and shaft drive.

Catalogue descriptive of Type X, $900, Type VIII Tonneau Car, $1400, and Type XI Four Cylinder, Side Entrance Tonneau Car, $2000, with dealer's name, sent free upon request.

THE AUTOCAR COMPANY, Ardmore, Pa., *Member Association Licensed Automobile Manufacturers.*

"QUEEN"

The name stands for a line of cars that has no equal, either as a selling proposition for the dealer, or an investment for the individual buyer.

Staunch in construction, powerful in action, reliable in operation, and simple in control, Queen Automobiles best meet every requirement of automobile worth.

Queen Runabouts. Queen Det. Tonneaus.

The Expected Revolution Has Come!

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found he only good reason why you should ***not*** buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the ***two*** cycle two cylinder Elmore engine.

Understand—the ***two*** cycle two cylinder Elmore engine produces ***two impulses every time the fly-wheel turns.***

As you know, the two cylinder ***four*** cycle furnishes only ***one*** impulse every ***fourth*** time the fly-wheel turns.

In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time n finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

THIRD IN ELIMINATION RACE, SEPTEMBER 23rd.

IF YOU BUILD A RACING CAR,

to run 60, 70, or even 80 miles an hour, you won't need any extraordinary mechanical ability. You won't produce much that is of value if you succeed.

BUT

if you become the owner of a **ROYAL TOURIST,** you have a car that can go fast enough to qualify in the **VANDERBILT CUP TRIALS,** and make the round of the course any number of times without the troubles the racing cars had, and one that will stay on the road, carry its passengers with comfort and safety, do its work quietly, and without strain on the motor or running gear.

REMEMBER

The Royal proved itself faster than the racers, and any owner will tell you about its reliability and comfort.

THOMAS 1906

A PERSONAL STATEMENT FROM MR. E. R. THOMAS.

"Hitch Your Wagon to a Star."

My friends have long known that it has been my cherished ambition to build the best car in the world, or at the very least, one of the greatest.

I do not mean the fleeting reputation gained by enormous outlays for advertising and the performance of road and racing stunts by highly paid employees with special cars or well groomed individuals of social and business prominence always accompanied by factory experts. But I do mean the permanent reputation founded by actual performance in the hands of the general public which comes solely from intrinsic merit.

Years ago—surrounded by noted mechanical talent—we built one of the greatest bicycles of the world, which was better than any foreign continental production. The principles of automobile construction are the same, except that mechanical power is substituted for human. Since 1897 I have been building vertical gas engines by the thousands. Then, why not, at least one of the best automobiles?

I knew that with us it was only a question of design, material and time. It was not a question of experience in fine workmanship. We had that. Nor was it a question of profit, for that would surely follow.

In 1904 daylight began to appear. Two cylinder vertical motors were the vogue. I went one better and built three at the same price. It was far superior to any two cylinder proposition on this side of the world or the other.

Design was greatly improved, crude and accessory manufacturers improved their material, the car proved highly efficient, and the star we had "hitched to" seemed nearer and brighter. It was in this year that I designed the safety device which has saved lives—also the curved dash with small tool lockers and the chain pull that equalizes the strain on the main bearings. We also used chain oilers on the crank and transmission shafts.

In 1905 we built a four cylinder car which, with nominal advertising, no traveling agents, and no performance of road or racing stunts, requiring special cars and highly paid factory experts, we again caught the public favor and quickly sold four hundred big touring cars—no more and no less. We were compelled to refuse many additional orders, some with bonuses above the price, of from Two Hundred and Fifty to $750.00.

It was in this year I patented the now famous dust proof body and introduced lockers and rails for wraps and many other features of comfort and efficiency.

The result in every way exceeded my most sanguine expectations, and the star shone still brighter and was much nearer.

Our success was so great I have about completed a new model fire proof factory constructed entirely of concrete, steel reinforced. The mechanical equipment has been greatly increased. The capacity is one thousand fifty horse power automobiles.

I have the same superb mechanical force who are inspired by the same ambition and who are co-operating with me loyally and energetically to realize our high ideals, and which we believe will be fully realized in the 1906 Thomas Flyer, which has been greatly improved in every detail of workmanship, material and design—notably:—

Forged I beam axles—great, strong steering knuckles—steering apparatus all forged. No brazed joints. Cross steering rod behind front axle. Large separate motors. Mechanically operated valves, opposite sides. Improved radiator fan and pumps. A disc clutch that will not slip under any condition when engaged. Four forward speeds—with one Hyatt roller and five Hess-Bright bearings. Altogether, fifteen Hess-Bright ball bearings, one Hyatt roller and two ordinary ball bearings—twenty-one anti-friction bearings in all. A beautiful new dash and body seating five or eight, as desired. Four great big wide brakes—the foot alone will stop a loaded car on a twenty-five per cent. down grade.

I am very proud of the new 1906 Thomas Flyer, and I believe the American public will be proud of it. The best foreign cars may have some few unimportant details that we haven't got—and we have some important ones they do not possess.

But we have put the design, material, workmanship and money into this car to make it at least equal to the highest priced car in the world, and I believe that the verdict of a just people will, based upon intrinsic merit solely, place the 1906 Thomas among the world's greatest and best, and as such I present it.

E. R. THOMAS,
For The E. R. Thomas Motor Company.

Glad to Get Back To GOODRICH TIRES

Mr. H. C. Baxter of Walpole, N. H., in a letter of September 12, 1905, writes as follows:

"I am glad to get back to the use of your tires, after having satisfied my desire to test a foreign make, which I have found did not give me as good service on our country roads as yours, which I have used for years, have given me. I shall use your make in the future. At present I have a 24 h. p. Peerless, which I am using to make business trips between our canneries in New Hampshire and Vermont."

Yours truly, H. C. BAXTER.

THE BAILEY "WON'T SLIP" TIRE.

Regular Goodrich construction, but provided with the Bailey "WON'T SLIP" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyrighted mark have been inspected and pronounced perfect. We guarantee our tires only on rims so branded.

Mr. C. E. Miller,
#96 Reade Str.,
New York.

Dear Sir:-

I wish to write you regarding the Brampton chains which I purchased for my Franklin car.

No. 1 I have used all the time and have given it about as hard a pull as it is possible for a chain to receive. All over the mountains of Orange County, New York, and between New York, Philadelphia and Lakewood until I am tired of the road.

The long chain on the Franklin is a pretty stiff proposition and many, in fact, most of my friends state that their first trouble on that car is that chain breaks and I have not people who have worked for hours to get their chain fixed on the road, but I have never met a Brampton in trouble and mine so far has not a scratch on it.

No. 2 is in the paper in which your salesman wrapped it for me, and is resting in the bottom of the car waiting for No. 1 to break.

My partner, Mr. Wilmarth, President of the L. I. Automobile Club, has a Brampton on his Winton and has had practically the same result as myself. He got me in line for the Brampton and there I stay.

Very truly yours,

Dict.

GROUT

The New Grout Gasoline Light Touring Car

Grout Bros. Automobile Company

Orange, Mass.

Price $1,800.

28-30 H. P., 4 cylinder, balanced motor, high tension ignition using one coil with distributing commutator.
Forced ventilation by fan.
Mechanically operated valves.
Inlet valves interchangeable with exhaust valves.
Control on steering wheel to gas and ignition, no motion transmitted to these levers by movement of steering wheel.
Gear, three speeds and reverse actuated by single lever.
Wheels, 30 inch artillery, wood, ball bearings, 3½ inch tires.
Armored frame.
Steering by irreversible worm and sector, dust proof and oil tight.
Lub ication; mechanically operated oiler, a definite amount of oil to all cylinders, crank bearings, connecting rod bearings, etc.
Lubricating system has received great attention and is particularly thorough. It is non adjustable, that is, set at the factory and needs only to be supplied with oil.

MICHELIN

Fifty per cent. of the four cars finishing in The Vanderbilt Cup Race were equipped with

MICHELIN TIRES.

All cars in the contest, equipped with Michelin Tires, experienced no trouble from punctures, or other sources.

Taken ten days before the Eliminating Trials.

The Premier Vanderbilt Cup Racer will not compete in the finals

for the simple reason that the Racing Board—as their chairman admits—refused to consider it in selecting the team to represent America.

This car was finished and subjected to more than 500 miles of road and speed tests before the date of the eliminating trials. However, it was overweight by about 100 pounds. We inquired if we could enter the eliminating trials, agreeing to reduce the weight later in such a way as would satisfy the committee that we had not sacrificed the reilability of the car, and agreed that we would abide by their decision. We were advised that we could not do this, and accepted the decision without a murmur, but immediately set about to reduce the car to the proper weight.

Monday, after the eliminating trials, we were advised that three of the only five cars which finished in the trials, would be dropped out, which would necessitate filling the created vacancies with cars which for some reason had failed to qualify in the elimination trials. If the eliminating trials meant anything, we consider that the five cars which finished should be allowed to compete in the finals. Since the failure of the committee to take this view (as evidenced by their decision) created three vacancies, which, if filled, must of necessity include three cars which for some reason failed to quality, we could not see that only a failure on our part to weigh in originally, should eliminate us from further consideration, any more than the failure of other cars to finish after they had started in the contest.

On Monday following the Elimination Trials, we wired the committee that our car could weigh in, *and offered it subject to any tests they might designate.* We were advised by the chairman that "We were compelled to select the team without reference to your car." IS THIS AMERICAN SPORTSMANSHIP?

Timken-Lemoine Front Axle.

Much of the satisfaction resulting from the use of Timken Roller Bearings is due to the simplicity of construction,—few parts and every part a special feature.

We think this explains why it is easy to sell so many of them and why owners of machines demand them.

A good automobile is no stronger than its weakest part. Can you afford to have anything but Timken bearings?

Positive adjustment. No loose parts. Perfect end thrust and you can take up the wear.

All types front and rear axles, Lemoine or Elliott knuckles, direct and chain drive rear axles, truck axles, wheels, channel rims.

TIMKEN ROLLER BEARING AXLE CO.

Main Office and Works: CANTON, OHIO.

This AUTO TIRE has no BAD HABITS

It won't creep—it won't rim-cut—it won't come off the rim when run deflated no tire bolts required to hold it on the rim—and you can take it off and put it back in 60 seconds, using nothing but the hands. And it's a Tire, besides, that's as resilient as a "soft" tire, and will outwear most "hard" tires.

Sounds like a fish story, doesn't it?

But it's a *fact*, nevertheless.

Barney Oldfield didn't believe it, either, but he does now.

We *showed* him—he saw with his own eyes—and now he uses the Goodyear Detachable Auto Tire with the Universal Rim in all his races.

He used this tire at the Boston meet on Sept. 9th, where he made five miles in 4:55 and a mile in :55 1-5—breaking the track record.

You ought to hear Barney's chaffeur sound the praises of the Goodyear Detachable to all who will listen to him—hear him tell how reliable it is—how it saves him time, trouble and worry and makes his position easy. He says he never thought it possible (before using the Goodyear) to embody all the good points a tire *ought* to have in one single tire.

We wish you could come with us to the factory or to one of our branch stores. Then you could see in no time for yourself just why and how these things are true. You can "see through" it all instantly when the tire is before you.

We'll try, however, to explain just *one point*, here.

Why the Goodyear Detachable Auto Tire is *Durable* and *Resilient* at the same time.

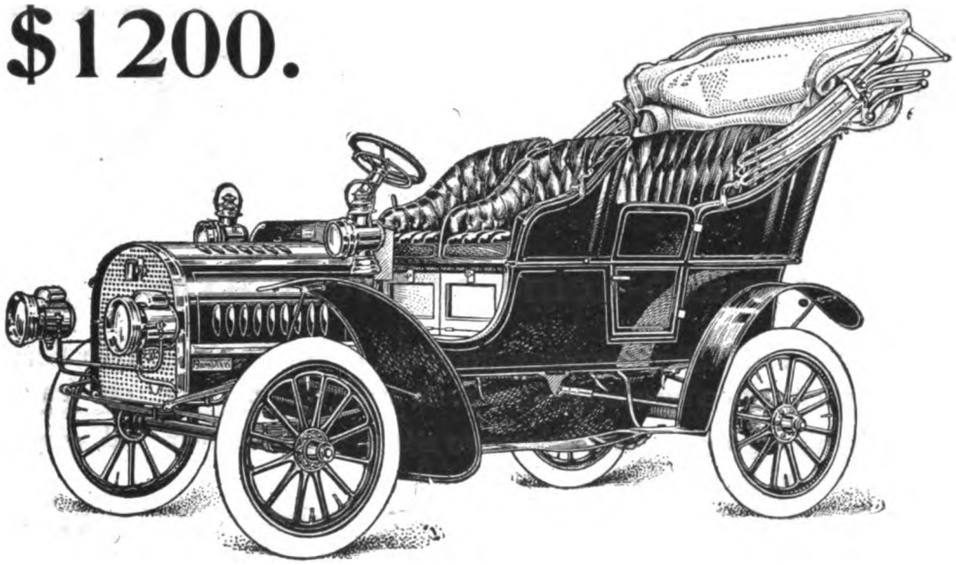
Look at the section of the Goodyear Tire in the center column. Notice the crescent shaped portion in solid black where the wear of the road comes. That's dense, firm rubber, as tough as rawhide—practically no wear out to it.

Now right underneath this is the remainder of the outer casing (shown in grey) which is made from pure para rubber, as resilient and springy as it is possible for rubber to be.

These two different kinds of rubber—the dense, tough composition, to take the wear, and the soft, elastic rubber, to make you ride easy—are made into one solid piece by a special process. You can't skin the two kinds of rubber apart with a knife. Try it if you doubt.

The soft rubber portion is strengthened by having our *special fabric* vulcanized into it. This fabric is not the hard, inflexible sail cloth used in ordinary tires, but is woven like basket work, or an open-work stocking, and *gives* back and forth under pressure, and allows the elasticity of the rubber full play.

The dense rubber, the soft rubber and the special fabric together make a tire that's almost as durable as a *solid* tire, a tire difficult to puncture yet one which is as *resilient* as a man could reasonably ask.



Our "Good News Book" tells more about the good points of this trouble-saving tire. You ought to get it now, for the Goodyear Detachable Auto Tire with Universal Rim will be "the only tire" next season.

THE GOODYEAR TIRE & RUBBER COMPANY, Grove Street, Akron, Ohio.

Branches in following cities: Boston, 6 Merrimac St.; New York, 253 West 47th St.; Chicago, 110 Lake St.; Cincinnati, 242 East Fifth St.; St. Louis, 1219 N. Broadway; Cleveland, 69 Frankfort St.; Philadelphia, 1521 Spring St.; Denver, 220 Sixteenth St., and Detroit, 242 Jefferson Ave.

$1200.

Rambler

The Deacon's One Hoss Shay became famous not for its complicated "frills," but because it ran and kept on running.

This story is repeated in the Rambler. Every complication of questionable value is omitted and every effort has been devoted to serviceability, power, utility and the utmost simplicity of design and operation.

The result is a car of unfailing dependability that will travel day after day without tinkering and adjustment.

Surrey Type One, shown above, with full equipment of lamps, horn, tools, etc., $1200. Cape top $100 extra; canopy top with glass front $100 extra.

A practical road demonstration at any of our branches or agencies, will convince you of its merits.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, October 19, 1905. No 4

NEW G & J TIRE COMING

The Indianapolis Company Has a Big Surprise in Store—An Inkling of Its Nature.

There's a G & J mechanically fastened tire on the way; in fact, it is almost ripe for marketing.

This rather surprising news leaked out early this week, and when it becomes more generally known it will cause something of a sensation, so long and so firmly have the G & J Tire Co. been wedded to the clincher type of tire.

There is no reason to believe that the latter will lack for attention—such a state of affairs seems improbable—but the mere statement that the G & J people are making ready a tire of the other sort will cause all who have to do with tires to set up and take notice and to await developments with eagerness.

No F. I. A. T. Factory for America.

Up Binghamton way—Binghamton, in New York—they've had visions of a factory producing Italy's renowned F. I. A. T. car right here in America. The public prints in that part of the state are talking about it at length, and in big black headlines. Where the report originated is not known, but at any rate Hollander & Tangeman, the American representatives of the F. I. A. T., say there is not a word of truth in it. The establishment of a factory in this country, they say, is not contemplated, has never been discussed and nothing is more unlikely.

Smith and Eames Sever Contract.

On October 15 the contract between the A. O. Smith Co., Milwaukee, Wis., and Hayden Eames, Cleveland, Ohio, was terminated. Henceforth the Smith company will themselves handle the sale of their products.

Fosdick Gets the Studebaker

The Harry Fosdick Co., Boston, have acquired the New England agency for the Studebaker line, both gasolene and electric vehicles. The Fosdick store at 53 Stanhope street will be formally opened November 1.

Prest-o-lite Factory for Pacific Coast.

There is to be a Prestolite gas tank and charging factory on the Pacific coast, in either San Francisco or Oakland, Cal. The demand west of the Rockies for that new means of illumination is deemed sufficient to justify it. The call has been met with reasonable satisfaction, but the items of time and freight rates have hindered proper development, and these questions the factory in California will solve quickly and for all time. F. E. Avery, of the Concentrated Acetylene Co., left Indianapolis on Tuesday to prepare the way and complete the necessary arrangements.

Brady on His Own Account.

Jackson ("Jack") Brady, formerly connected with William E. Metzger, and for the last year retail sales manager of the Packard Motor Car Company, at Detroit, has gone into business for himself in that city, and will erect a large and pretentious garage. He has secured the Michigan State agency of the Peerless, and the local agency of the Packard Car.

Firestone to Open in Detroit.

The Firestone Tire and Rubber Co., Akron, Ohio, are making ready to establish a branch in Detroit, and already have chosen the man to manage it. He is E. E. McMasters, for a number of years manager of the Hartford Rubber Works Co.'s depot in that city. McMasters has resigned the latter office in order to accept the new one.

Foss-Hughes Will be Their Style.

Foss-Hughes Motor Car Co. will be the style under which those two former Pope managers will operate when they begin business in Philadelphia on the first prox. In addition to the Cadillac and Pierce lines they have secured the agency for the Baker electrics.

Dowling Gets Pierce Territory.

In the readjustment of affairs following the dissolution of the firm of McGuire & Dowling, Boston, Mass., J. A. Dowling, of that city, has obtained the Pierce agency for Maine, New Hampshire and Vermont. He will handle the business from either Portland, Me., or Portsmouth, N. H.

THOMAS BUYS $350,000 SITE

And Will Build a Palatial Garage on Broadway—Location is a Choice One.

E. R. Thomas, of Buffalo, this week perfected arrangements that will cause the Thomas banner to flutter in the breezes of the metropolis in an impressive fashion, which is to say that acting as an individual he paid $350,000 for a parcel of real estate at the southeast corner of Broadway and Sixty-third street, on which he will erect what is planned to be the most commodious and palatial four-story salesroom and garage in all New York.

The site measures 114 by 145 feet and practically abuts on Central Park. Although in the immediate vicinity of the congested automobile "colony" on Seventh avenue and lower Broadway, it is removed from them, being on that portion of Broadway which formerly was styled the Boulevard—a wide asphalted thoroughfare bisected by a neutral ground. It will give the garage a "pride of place" that is undeniable. When completed, the structure will be leased to Harry S. Houpt, the New York agent for the Thomas cars, who but four or five months since removed to a new garage on Seventh avenue that was also built specially for him.

Elmore to Launch Four Cylinder Car.

When the Elmore line for 1906 is uncovered it will disclose at least one fine large surprise—a 50-horsepower, four-cylinder car equipped with the Elmore two-cycle engine, which will list at $3,000. There is believed to be but one other four-cylinder, two-cycle car in existence, so the new Elmore will have rare distinction. One of those favored with an advance view describes it as "sumptuous." In addition the Elmore Manufacturing Company will market a 24-horsepower model at $1,500—also a new comer.

Cadillac Abandons Three Cylinders.

After all, the Cadillac Automobile Company will not market a three-cylinder model. That idea has been abandoned and instead, all of the big new Cadillac cars will be of four cylinders, rated at respectively 22, 30 and 40 horsepower.

Digitized by Google

In the Retail World.

Abram B. Meyer is building a 50x83-foot garage at Nos. 9 and 11 Hill street, Newark, N. J. The cost will be $4,803.

Robbins Bros., who have the Lynn (Mass.) agency for the Waltham-Orient, will open a branch at Columbus avenue and Elliot street, Boston, on December 1.

E. G. Mooney and Edward Seely, as the Central Automobile Co., Pittsburg, Pa., are building a one story brick garage, 50x115 feet. It will be located in the East End, on Broad street, near Euclid avenue.

John Besley and Nick Nelson have joined hands and capital and will endeavor to sell automobiles to the residents of Waukegan, Ill. A plot of ground on Madison street, on which a garage will be erected, has been purchased for $8,000.

The W. F. Embree Co., Lynn, Mass., has moved from its old plant on Willow street to more spacious quarters in the new McGarry Building, at Union and Washington streets. In connection with their regular machine work, they will conduct a garage.

Parkersburg, W. Va., and Chillicothe, Ohio, are said to have made flattering inducements to the Oscar Lear Automobile Co. to move its plant from Columbus, Ohio. Meanwhile the local business men are endeavoring to keep the industry in Columbus.

The Atlas Automobile Co., Pittsburg, will build a two story and basement garage of concrete construction, 85x120 feet, to cost $25,000. The building will contain salesrooms, repair shop, electric charging plant and storage room for three hundred cars.

Plans have been drawn for the new building to be erected for the Detroit Auto Specialty Co., in the city from which the company derives its name. Specifications call for a two story building, solid brick in construction, 45x183 feet. The estimated cost is $10,000.

Thomas S. Morse, who started in business at Pittsfield, Mass., last spring, has found his present garage insufficient to accommodate the needs of summer tourists. He accordingly will raze the small adjoining buildings and extend the garage to Church street, doubling its capacity.

S. A. Miner, the Hartford, Ct., agent for the Knox and Pierce-Arrow cars, who took out papers last week as the Miner Garage Company, is building a two-story fireproof brick garage at High and Allyn streets, that city. The building will be 110x86 feet, and have a floor space of 15,000 feet. The salesrooms, offices and waiting rooms will occupy the first floor, while on the second will be the storeroom and repair shop. It will be completed by January.

Somebody of the name Nelson wanted to build a one story frame garage, 40 by 70 feet, on the west side of the Boulevard, between Cottage street and West Newark avenue, Jersey City, N. J. He accordingly secured a permit, but now property owners in that vicinity have asked the Board of Aldermen to revoke the permit, giving as their reason that the use of gasolene in the building would be conducive to fire. The protest has been referred to the Aldermanic Committee on Laws and Ordinances for adjudication.

De Turckheim Disappears; Charges Follow.

Judge Holt, in the United States District Court, has appointed Lindsay Russell receiver to straighten out the affairs of Frederick de Turckheim, who was in business at 215-217 West Forty-eighth street, New York City, but who, it is alleged in the petition, has "skipped" the country, leaving debts amounting to $2,246. Part of this amount is a debt of the American branch, De Dietrich Motor Car Company, which de Turckheim assumed, and the balance for goods sold to de Turckheim on February 18, 1905. The Continental Coautchouc Company is the petitioning creditor. It is charged in the petition that the alleged bankrupt has drawn his cash balance from the banks wherein they were deposited and that the large stock of cars which he had on hand October 5 have also disappeared as mysteriously as he. De Turckheim was formerly known as president of the American De Dietrich Motor Car Company when that concern was at 1½ West Thirty-fourth street, New York City.

Woods Gets a New Location.

A deal has just been closed whereby the Woods Motor Vehicle Co., of Chicago, Ill., secures a new building on the west side of Cottage Grove avenue, ninety-four feet south of Twenty-fifth street. The building will have a frontage on Cottage Grove avenue of 115 feet, and extend through to Calumet avenue. The lease runs for ten years from May 1, 1905, at a rental of $9,000 a year, the owner paying taxes and insurance.

Receiver for Detroit Concern.

Pending the hearing of foreclosure proceedings instituted by him as trustee under a mortgage, Frank N. Crosby, a receiver has been appointed for the Commercial Motor Vehicle Co., No. 257 Franklin street, Detroit, Mich., of which J. B. Book is president and Frederick S. Evans secretary and manager. Crosby alleges that default has been made in the mortgage agreement.

Kennedy with a Million in Cortland.

Cortland, N. Y., is on the eve of securing a new industry, and a big one, as some figures go. On the strength of claims made for a new automobile which Thomas J. Kennedy is said to have invented, the Cortland Automobile Co. will be incorporated, with capital of $1,000,000. The disused plant of a wagon manufactory has been optioned.

The Windsor Motor Car Co. has been organized at Evansville, Ind., to manufacture automobiles. Chicago and Evansville capital is interested in the project.

The Week's Incorporations.

Milwaukee, Wis.—E. W. Arbogast Motor Co., under Wisconsin laws, has filed a notice of dissolution.

Detroit, Mich.—Fee-Bock Auto Co., under Michigan laws, with $2,500 capital; to make automobiles. Corporators not named.

Albany, N. Y.—Auto Exchange Co., under New York laws, with $500 capital. Corporators—William H. Dennin, Charles C. Kelley and T. J. Quilliman.

Buffalo, N. Y.—Manzel Bros. Co., under New York laws, with $30,000 capital; to make lubricants. Corporators—Adolph, Herman J. and Fredericka Manzel.

Detroit, Mich.—Detroit Auto Specialty Co., under Michigan laws, with $3,500 capital. Corporators—John A. Wilson, Hyman L. Geldman and J. L. Maniere.

Aurora, Ill.—Practical Automobile Co., under Illinois laws, with $100,000 capital; to make automobiles. Corporators—D. D. Culver, Thomas W. Green and Merrick Edwards.

Quincy, Ill.—Quincy Automobile Co., under Illinois laws, with $50,000 capital; to manufacture automobiles and parts. Corporators—J. W. Cassidy, H. Chatten and W. H. Govert.

Cleveland, Ohio—The Standard Automobile Co., under Ohio laws, with $10,000 capital. Corporators—F. B. Williams, T. H. Hoggsett, M. G. McAleenan, George H. Smith and George H. Kelly.

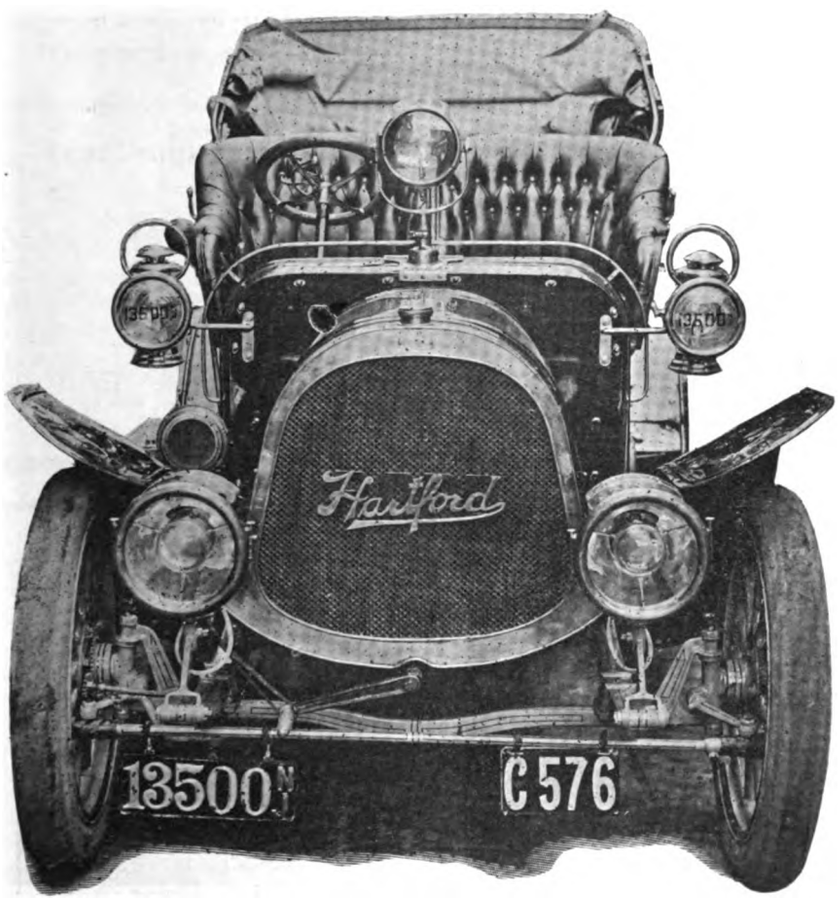
Boston, Mass.—Automobile Sales Co., under Massachusetts laws, with $10,000 capital; to deal in automobiles. Corporators and officers—President, Lorenzo D. Bates; treasurer, Fred S. Macalaster.

Troy, N. Y.—Troy Automobile Exchange, under New York laws, increases capital stock from $5,000 to $50,000, par value $100. Corporators—William H. Dennin, Charles C. Kelley and E. Augustus Dennin.

New York City, N. Y.—Automobile Buyers' Association, under New York laws, with $10,000 capital; to manufacture and deal in automobiles. Corporators—Samuel C. Meer, Eugene C. Harding and Clarence E. Mandy.

Summit, N. J.—Summit Garage Co., under New Jersey laws, with $25,000 capital; to deal in automobiles. Corporators—Walter C. Sampson, W. C. Johnson, Charles A. Grant, William L. Lampson, Charles S. Hardy, Edward Benedict and B. C. Wilson.

New York City, N. Y.—Manufacturers' Motor Car Co., under New York laws, with $50,000 capital; to manufacture engines, tools, machinery, etc. Corporators—F. C. Henser, Dana T. Ackerly and William H. Morgan.



New York City, N. Y.—Austin-Cormack Engine Co., under New-York laws, with $5,000 capital; to make engines, motors, etc. Corporators—Frederick Cormack, William K. Austin, Maurice H. Cormack and George M. Kennoch.

POPE'S NEW HARTFORD

Features of the New Four Cylinder Member of that Branch of the Family.

Of the totally new models which the Pope Mfg. Co. will market for 1906, most interest probably will centre in the four cylinder Pope-Hartford, shown by the accompanying illustration. It is of the style that has commonly come to be accepted as representing the highest degree of convenience and efficiency—that is, the four cylinder vertical

type, with the engine located under the bonnet. In the present instance all the improvements that have by long experience demonstrated their fitness have been incorporated, together with a number of novel features evolved in the Pope draughting rooms and perfected by the engineers of the company's staff.

The cylinders are cast in pairs, with integral heads and water jackets, and while their dimensions are not given, the engine is said to show 28-30 b. h. p. under test, although the car is nominally rated at 20-25 horsepower. The valves are located in the heads, are all mechanically operated and interchangeable, and all gears of the time shafts are incased. The crank case is provided with two generous sized hand holes, through which every bearing of the crank shaft is readily accessible. A compensating joint is placed between the engine and the change speed gear box, which is of the standard sliding gear type inclosed in an aluminum case, and gives three speeds forward and reverse. The specially hardened steel gears are mounted on large shafts, the counter shaft being provided with three substantial bearings solidly bolted into the case, which has no end openings, as is customary in many. All bearings are of high grade phosphor bronze, and the gears and bearings, with the exception of the front and rear main bearings, are immersed in oil, these being lubricated from two oil wells in the bearing case by means of ring oilers. The gears are shifted by a single hand lever at the right of the driver through the medium of a sector and pinions, a rack on the inside of the gear case being directly connected with gears, while the thrust at this point is taken up by a substantial ball thrust bearing. Transmission is by propeller shaft, which is equipped with a universal joint at each end, these joints being so arranged that all bearing surfaces are kept well lubricated. All parts of the joints and shaft are made of a special high carbon steel, with liberal sized pins working in removable phosphor bronze bearings. The pinion shaft of the bevel gear is made integral with the pinion itself, and runs on two Timken roller bearings. The split rear axle proper, or driving shafts, have squared ends fitting in holes in the differential, insuring a strong connection and durable construction. These shafts are securely keyed and locked at their outer ends in the wheel hubs. The thrust of the bevel driving gear is taken up by a large ball thrust bearing, supplemented by hardened steel washers and supported by the main bearing of the case.

Ignition is by jump spark, a combined commutator and secondary distributer being located between the second and third cylinders, and is driven from the cam shaft through a pair of spiral gears, while the single coil is placed on the dash, which also accommodates a belt driven lubricator supplying the cylinders and engine bearings. The carburetter is a special Pope design made by the company, and has been found to combine great flexibility with a high degree of efficiency. Throttle control is by the usual small lever rising out of the centre of the steering wheel, as does also the ignition advance lever, neither, however, revolving with the wheel.

External clamping band brakes faced with camel's hair belting and acting on a drum attached directly to the transmission shaft at the rear of the change speed gear case, and internal expanding brakes on the same kind on drums bolted to each rear hub, constitute the stopping power, either branch of which is said to be capable of locking the wheels with slight effort. A summary of its remaining specifications is as follows: Wheel base, 98 inches; tread, standard; gasolene capacity, 15 gallons; water, 5 gallons; double side entrance, non-removable tonneau; the equipment comprises the regulation set of five lamps and generator, horn and tools. Without top this new model lists at $2,500, and, as will be noted from the accompanying head on view, the form of radiator employed gives it a distinctive appearance.

Cars for Russian Use.

C. S. Smith, Great Britain's consul general at Odessa, Russia, in his report to the Foreign Office, states that "motor cars are coming largely into use for communication between country houses and the nearest town or railway, and also for inspection of estates. At present motor cars are supplied to Odessa by the United States, France and Germany. For long runs the 12 horsepower machine is bought; for estate inspection, etc, the 8 horsepower engine. Any one who wishes to try his luck in South Russia should remember that the roads are bad and repair shops may be far away, so that strength and simplicity are more than ever desirable. Water is often difficult to obtain, so that steam motors should have water space sufficient for long runs without need of replenishment."

Densmore Joins Centaur Staff.

W. R. Densmore, long connected with the Packard Motor Car Co., Detroit, has resigned his office with that company to engage with the Centaur Motor Vehicle Co., Buffalo, N. Y. The Centaur company, incidentally, have recently secured the Peerless agency for Buffalo and vicinity.

The Constructive Principle of Fisk Tires Involves

A Technique So Simple in Manipulation and So Positively Accident=Proof

that it should readily appeal to any discriminating purchaser.

Beads of a wedge shape are applied to a flat rim and held by rings which are rolled on an angle corresponding to that of the bead, so that when drawn down by clamping bolts, the bead acts as an inside cone wedge, with the result that the tire is firmly held to the rim, without air pressure or circumferential contraction.

A Tire so Locked to the Rim Incorporates a "Life Preserving Principle" and Reduces Tire Maintenance to an Economic Basis.

A CADILLAC Dealer

Mr. C. C. Henry of Summit, N. J., who has sold over 40 Single Cylinder Cadillacs since June 15, 1905, recently placed the following four-inch double column "ad." in the two largest local papers published in his locality : —

WANTED
Second-Hand Model F Cadillac
at once. State Price.
C. C. HENRY,
Cadillac Factory Agent,
SUMMIT, NEW JERSEY.

The Jerseyman, Sept. 22, 1905.

WANTED
Second-Hand Model F Cadillac
at once. State Price.
C. C. HENRY,
Cadillac Factory Agent,
SUMMIT, NEW JERSEY.

Madison Eagle, Sept. 22, 1905

WANTED.—A Second-Hand Model F Cadillac, at once. State Price.
C. C. HENRY, Cadillac Factory Agent.

Herald, Summit, N. J.

Mr. Henry, writing under date of October 3rd, 1905.

"I did not get a single reply. No one in this country wants to dispose of their Single Cylinder Cadillacs."

The above ought to convince most any level-headed dealer that the Cadillac agency is a valuable asset.

NEW YORK, OCTOBER 19, 1905.

The Contest for the Cup.

If it is possible for the glory of Tracy's performance in the Vanderbilt Cup race to blind one to the pitiful shortcomings of the other American contenders, that event must be written a magnificent achievement—an event that compares with the periodical struggles for the America Cup emblematic of international yachting supremacy.

There are those—there always will be those who wear their whiskers in knots or whose blood runs cold who find no fascination in speed—in contests of skill and daring in which the element of danger exists. They will condemn and decry, but the world—the great, big world—will laugh as it has laughed at them. The world loves speed, loves skill, admires daring, it matters not what form it may assume. Such love, such admiration, is inherent. Man wants no horse drawn car when an express train is available.

The man who will not, on occasion, "take a chance" and brave a bit of danger, or thrill when others do so, does not really live—is not fit to live. And though for the moment he may shudder when he sees such amazing speed, such marvelous skill, such magnificent daring as is exhibited in such events as the race for the Vanderbilt cup, the man in him must come to the surface and he must be glad that he is there to see it—there to experience the thrill.

The memory of that man Lancia—the realization that human hands can safely guide a ponderous wheeled vehicle at seventy-five miles per hour, or eighty miles, for hour after hour on unrailed earth—earth none too smooth and replete with twists and turnings—it is a memory worth retaining. It points the way, as the Motor World said long ago, to that day when men may breakfast in New York, lunch in Buffalo, and dine in Chicago. It points the way to that era of real rapid transit. For if men may travel seventy miles per hour on unrailed earth what may they not do when the same vehicle, the same form of power, is adapted to travel on the smoothest of prepared steel rails?

It was the sage Macauley who told us that next to the alphabet the greatest benefit to man were those inventions that abridged disance. By this standard who will measure the benefit of the motor car? Who will deride such as the Vanderbilt cup event that helps open the eyes of the world to such great and limitless benefits?

It was a great race—a splendid spectacle. The tremendous and unprecedented and unexpected outpouring of the multitudes—too great to be estimated in numbers—proved the public interest—proved how keen is the relish of speed and skill and daring. The fact that all critics save the professional critics and the men with tangled beards and disordered livers have been silenced—the fact that those people on whose hearthstones the race was held are most eager for the next one, is strong testimony—eloquent, expressive testimony. Danger? Why, the disregard of it was greater by the multitudes than by the skillful contenders themselves. It was the one discomfiting feature.

If the race was a good thing for France and for Italy—and it was—it was a better thing for America. It taught us many things that will be turned to profit. Let us forget Christie and White and say that America did no worse than Germany or Italy. Misfortune is the hazard in all sports. It fell to America in large portion, but when all is said and done Tracy's performance proved that America asks no odds, and requires few, of the foreign constructors of automobiles or of tires. Of tires none gave so good an account of themselves as the American article, and if American cars overheated or suffered breakages, so, too, did the foreign cars overheat and break.

There was glory enough for all in the race.

Every promoter of a contest looks to the trade to make it a success, that is to say, they expect the trade to supply the entries, every contest, of course, being supposed to redound to "the good of the industry." It is rare, however, that the trade is consulted or its wishes regarding time or place sought or respected. It now appears that the recent resolution of the N. A. A. M. not to engage in any further contests this year was designed to check this tendency and to discourage the holding of contests at this season of each year. The manufacturers are too busily engaged with the serious work of producing the new models to have time or men to spare for anything else. The reason and justice of the situation should be apparent to all.

Charity covers a multitude of sins. Let the Vanderbilt Cup commission, which in defiance of justice, of decency and of protest and criticism permitted such as the Christie car to battle for the honor of America to the exclusion of tried and better cars—let the members of that commission hide their diminished heads and be glad that the mantle of American charity is so big and so broad. If their feelings are keen they must, when they now think of that disgraceful episode, feel like very much less than the proverbial thirty cents. It is well to close the chapter with "Go and sin no more."

Two shows running concurrently in New York already have settled the "show question" for a number of manufacturers. They will not exhibit at either one. They are the manufacturers of certain materials or fittings. They could "be happy with either were t'other dear charmer away," and though they wish to be identified with the automobile industry they have not two sets of men that they can spare to be in attendance at exhibits at both shows.

One of the numerous guides for the motorist, advises the use of a combination of gasolene and alcohol to increase the speed of a car. Presumably the intention is to use the former in the car and the latter in the driver. The result is usually very effective under such circumstances.

FRANCE DEBATES WITH ITSELF

Selfishly Seeking to Kill Cup Races, a Secret Session Strives to Turn Effort to Tires.

Paris, Oct. 6.—The Sporting Commission of the Automobile Club of France has begun its sittings for the discussion of the 1906 program. As this amounts to nothing less than a revolution in automobile events the commission finds it necessary to thoroughly thrash out the whole matter before coming to a final decision, and it is probable that it will take some weeks to elaborate a program which is intended to develop the automobile movement upon entirely new lines.

At the first meeting it was only possible to settle some questions of principle. One of these was the organizing of a race for pneumatic tires which has been approved of by the commission, but owing to the numerous side issues that are opened up by a contest of this kind the pros and cons will have to be carefully considered before deciding upon the way in which the race will be promoted. So far as can be ascertained at present the pneumatic tire race will be the only long distance speed contest organized in France during 1906. Apart from this the Automobile Club will have nothing to do with racing in any shape or form. It has completely disassociated itself from the Bennett cup contest which has also been dropped by the other countries, and at the meeting held this week the sporting commission decided that the forthcoming race for the Vanderbilt cup will be the only one in which France will be officially represented, that is to say, in future contests for the Vanderbilt cup French makers, if they compete at all, will do so upon their own initiative. Supposing the cup to be won by a French car in the coming race the Automobile Club of France would have been required, under the ordinary condition of things, to organize a race next year in this country, for if we remember rightly the deed of gift stipulated that the race was to be run off in America for the first two years, even if the cup were won by foreign built cars, but if the trophy is again carried off by a French car this year it will presumably mean that the race will again have to take place in the United States in 1906.

Although the deliberations of the Sporting Commission are kept secret, except so far as concerns the decisions arrived at, I have reason for believing that the majority of the members are not in favor of organizing a Grand Prix race which was to have taken the place of the Bennett Cup. So far there has been no decision upon this matter, but there seems to be a decided understanding to let the Grand Prix drop, at least for the coming year, the explanation being that motor car construction has so far reached a stage of perfection that nothing can be learned now from races. The true reason is probably to be found in the fact that French makers find the races are profiting their foreign competitors more than themselves, since foreign motor car builders are learning lessons from races which the French have profited from in the past, and the recent successes of the Italian cars are impressing upon manufacturers in this country the necessity of maintaining the statu quo so far as the industry is concerned. It remains to be seen whether the foreign makers will accept this condition of things, or whether the American, English and Italian trades will continue to try to develop the automobile from racing experience in their respective countries.

If French manufacturers consider that they have done as much as they can to perfect the motor car, and that there is nothing more to be gained mechanically from organizing long distance races, they think that something should be done to encourage manufacturers of pneumatic tires to keep pace with themselves in automobile development. The progress of construction in pneumatic tires has been far less noteworthy than in any other branch of the automobile industry, and where such a perishable material as rubber has to be used it is difficult to see how much more can be done in the way of increasing the durability of tires. The manufacturer of motor cars who suffers most from the frailty of the tire thinks that the tire manufacturer would be able to considerably improve his product if he were encouraged to do so by the competition and experience of racing events, and for this reason racing interest during 1906 is to be centered entirely in a race of tires, the expense of which will fall upon the shoulders of the tire manufacturers. Each firm will have to run a car of a stipulated weight and certain load and will be required to run it under conditions that will test the qualities of the tires and at the same time show up their defects. All sorts of proposals have been put forward for the carrying out of such a rach, such as restricting each maker to one set of covers and a limited number of air tubes, and compelling him to run his car at speeds that will put the greatest amount of work on the tires. But each of these proposals opens up difficulties and objections, so that on the whole it will be a no easy matter to fix upon a set of rules that will prove entirely satisfactory to all concerned.

It must be admittedthat the tire firms seem by no means so enthusiastic over the prospect of a race as they were when it was first mooted. It was obvious that they could hardly have refused this ordeal for fear that motor car users might have put an uncharitable construction upon their attitude, but at the same time they must feel they are being placed in an awkward position through being obliged to take part in races where the weakness of their tires will be revealed more strongly than their good qualities, and they could besides very well have done without this shifting of the heavy expense and responsibility of racing from the shoulders of the motor car manufacturers on to their own. After all, the tire race is not intended so much to advertise the manufacturer as to benefit users by compelling the tire firms to improve their products. These latter have for many years been reaping the profits of what is almost a monopoly, and they can very well afford now to do something to reduce as much as possible the cost and trouble incidental to the use of tires.

The Sporting Commission has also decided upon organizing a huge touring competition upon the lines suggested by the Marquis De Dion when the vehicles will be required to prove their endurance and reliability by travelling about 3,000 miles round Europe under certain stipulated conditions of load and speed. The touring tests carried out during the present year have given rise to a good deal of discussion as to the conditions under which they should be organized, for the methods of classification adopted have by no means given satisfaction to competitors who feel that the results are neither practical nor conclusive, and it will therefore be necessary for the great tour next year to fix upon a simple and effective classification which will be based probably upon the factors of speed and regularity.

Thomas to Offer $2,000 Trophy.

E. R. Thomas—not the New York banker, but the Buffalo manufacturer—means to give a cup—a cup of not less value than the Vanderbilt Cup. He witnessed Saturday's race, and it fired his blood. In fancy he saw the trophy leaving these shores, and he then and there determined to endeavor to bring it back again as the America Cup was brought back and kept here by American yachts.

Mr. Thomas believes it is in the American motor car to accomplish that very purpose. It is his wish to encourage that aim and to hasten its consummation. His cup will be offered with that end in view.

His plans are not yet settled, but soon will be. He has decided only that he will present the trophy, that the contests for it shall be open only to American cars, and that E. R. Thomas himself shall not be known in the matter, save by those who perchance may hold him in appreciative remembrance. He is not seeking glory or advertising or personal publicity of any kind.

His cup will not be styled the Thomas Cup. He inclines rather to Home Industry Trophy as the fitting title, but neither the title nor any other details are yet formulated. Mr. Thomas only wants Americans to bring back that Vanderbilt cup and to seek other cups emblematic of supremacy, and his offering is merely a spur to that ambition and a stimulant that will redound to the great good and credit of the American industry.

Distance of each lap, 28.3 miles. Distance of race, 283 miles.

It was a frantic waving of the green—a green flag—that signalled victory to August Hemery, the sour-visaged citizen of France, who, driving a Darracq car of 80 horsepower and weighing 2,060 pounds, won the Vanderbilt Cup on Saturday last, 14th inst.

It was a yellow flag, or rather a succession of yellow flags, that brought dismay to nearly all who finished after him, or would have finished after him.

The green flag was employed to convey to each contestant the message that he had completed the ten circuits of Long Island road that comprised the 283 miles that made up the course. The green had been waved to Hemery and to Heath, also representative of France, and, although the crowd knew full well that Lancia, of Italy, and Tracy, of America, were in full cry, the stupidity of a few Americans and the thoughtless inconsiderateness of thousands of others caused that flutter of yellow which officially spelled danger.

After the first two men had finished a youthful signalman two hundred yards removed from the tape held aloft his yellow flag. In quick succession every other signalman beyond him did likewise, and the spectators on that part of the course promptly swept aside the strand of heavy wire that had held them back and intruded on the road.

It was a scene that struck terror to the heart of the officials.

Those yellow flags signified that something had happened. Immediately yellow flags were ordered held aloft everywhere, while a courier on a motor bicycle was dispatched to learn what was the dreaded "something." The crowd opened for him, but he found no sign of disaster.

"What in —— are you holding up those flags for?" he demanded.

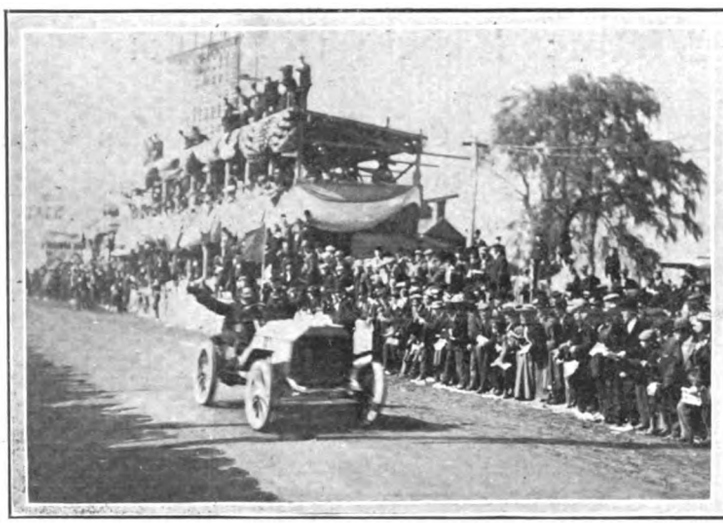
"To show that the race is over," blandly replied one of the country yokels who was holding a yellow flag.

"Put it down and keep it down. The race is not over until the last man has finished."

The yellow flags were lowered. But the courier had hardly returned and made his relieving report when a crowd of fifty men jumped the barrier near the approach to the tape and make a rush for that mark. Fifty more and a hundred more followed in their wake. The handful of uniformed rural policemen and the scores of special constables, dressed in their Sunday clothes and who were paid $3 each to meet just such an emergency, were helpless. Most of them stood like sticks.

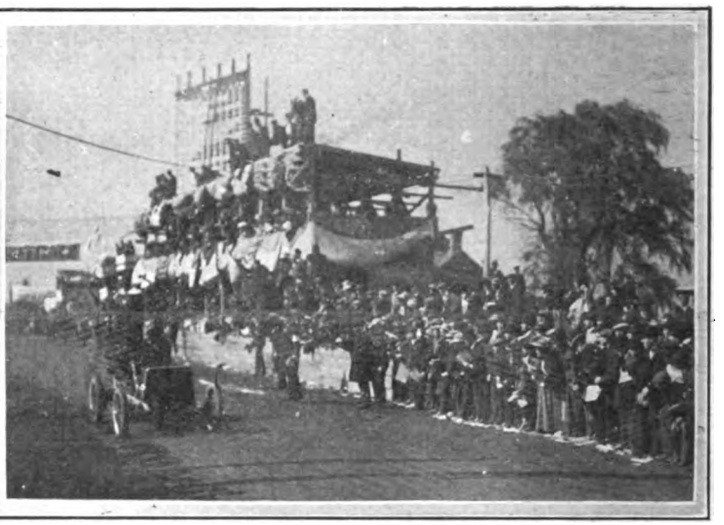
The officials of the race threw themselves into the breach. They stopped the rush for a few minutes, if they did not entirely clear the course.

Lancia and Tracy were due at any moment. Lancia came first. He was signalled to stop before he reached the tape. He came almost to a halt and then slowly drove to the finish line, where he stopped and waited. It was known that he had been in collision with Christie, and word passed that he was entering a protest of some sort. The rumor spread like wildfire.



The crowd leaped the barriers, reporters leaped out of the press box. The road was black with scurrying humanity, all heading for Lancia. There was no stopping the mob this time. Threats and appeals were vain. The officials rushed for the telephone booth.

"Order the race stopped!" was the burden of their instruction.



Eleven telephones at eleven corners of the course repeated the order. It was respected, but it brought dismay to five men who, though beaten, were yet intent on earning the credit of having completed the full distance.

Meanwhile a bugle call a half mile away, which was repeated by the bugler posted on the roof of the two story press stand, had given warning that Tracy was in sight. The crowd afar down the road could be seen opening to give him passage. The mob that had stormed the stands scattered tempor-

arily. Tracy thundered past and was swallowed in the human vortex that was swirling on the road as far as eyes could see.

Then the tens of thousands who had been held in at least partial restraint for five hours spread all over the highway. Touring cars, runabouts, bicycles, motor bicycles, even an occasional horsedrawn rig came from out of the fields and cross roads—men, women and vehicles seemed hopelessly intermingled. It was a scene that defies description. Viewed from aloft, it was in itself a sight worth going miles to see. On occasions large cities have held such surging mobs, but seldom, indeed, is it given man to witness such a picture on the quiet highways of a pastoral country. It was an hour before a semblance of order came out of the chaos.

Long Island may have had some great days, but in the memory of man there was none so great as this, Saturday, October 14, 1905.

Though Hemery won and the Vanderbilt Cup and the honors remain with France, the glory of the race belongs to Vincenzo Lancia, of the Italian team.

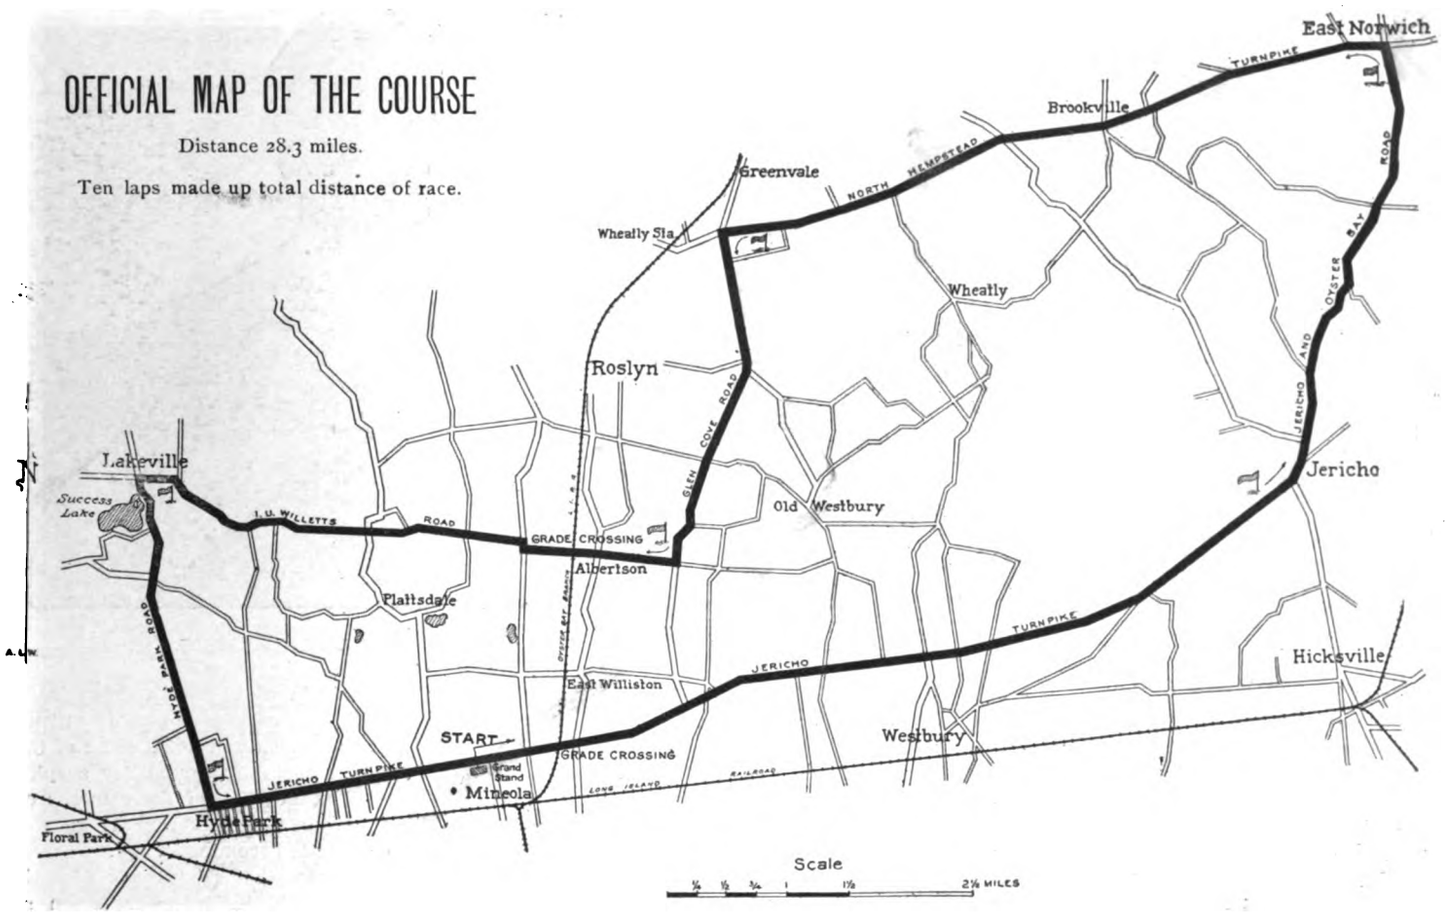
Lancia was the favorite before the race, and long before it was half over he proved himself worthy of the favoritism. He fairly drove himself into the affection of every man, woman and child on the course. He had the race won "hands down" when fate in the form of the cranky Christie car crossed his path, and, so to speak, cut him down and was cut down at the same moment. Christie, who was hopelessly out of the contest even before he started and who, so far as he himself and the country he so poorly represented were concerned, would better have been off the road than on it, was spilled with his mechanic and stopped right there.

Lancia, not so badly damaged, was able to effect repairs, but in effecting them he lost his long lead, and although he drove like a demon, was not able to regain it. But his demeanor and his conduct after all was over served only to add to his popularity. He accepted defeat with rare good sportsmanship and proved himself as courteous and considerate as he is skilful and courageous. He is big, broad and swarthy, with a full face, care free. He might readily pass as basso profundo of grand opera, save that he does not reflect the self-importance of that ilk. He has a pair of laughing black eyes, a merry smile that lights up his entire countenance and an easy, debonair, devil-may-care air that reflects a light heart and an ability to toss trouble. His driving accorded with his appearance. This country never had witnessed anything like it.

It was known that the F. I. A. T. representatives in America had left nothing undone that would contribute to the success of the dashing driver and his mates. They even had had erected a private telephone line around the course to better keep in touch with their men. So thorough were their arrangements that they had in readiness spare radiators on which the competitors' numbers were already painted. And then that Christie car, doubted by every American save those officials whose favor had kissed it into the contest, should come along and prove the undoing of all, and most of all, of Lancia! It was almost the irony of fate.

The start of the race was quite like the starts of other races of the sort.

Before the purple of the dawn that followed a glorious moonlit night had entirely lifted, eighteen of the twenty cars that had engaged for the long struggle over 283 miles of undulating and oil soaked Long Island road were, like huge, impatient beasts, "straining at their bonds" at the starting point at Mineola. Two unpainted pine structures, one the grandstand, peopled largely by wealth and fashion unaccustomed to such early hours, the other the double decked official stand, in which are housed timers, scorers, telephone attendants, reporters, and atop of which is a huge blackboard, a bugler in soldier clothes and a halfscore of photographers. Both stands are festooned with the national colors of America, of France, of Germany and of Italy, the four nations about to contend for supremacy and the Vanderbilt Cup.



The near approach of 6 o'clock causes a hurry and a scurry.

An official approaches the telephone booth.

"How's the fog in Guinea Woods?" he inquires.

A man at one of the many telephones repeats the inquiry. The answer is reassuring. It may be that the official breathed easier. Guinea Woods stands for a dark, deserted wooded stretch of country on the Glen Cove road near Albertson. It is not a pleasant place

Digitized by Google

in which to encounter a fog at any time. The man with the big megaphone shouts far-carried messages designed to clear the course of men and cars that have no business there. Other men with broad bands of ribbon on their arms—the officials—and others with badges on their chests and obviously countrymen—the special constables, seek also to relieve the congestion. They have not entirely succeeded, when a man in what is plainly a brand new suit of russet leather—the starter—and another in corduroy—the clerk—become all animation. There is a plentitude of shouted orders. Then a hooded individual with a high cheeked face, like a Mongolian, and a funny corkscrew beard of auburn hue, who had been walking around it, eyeing it critically, climbs into the big white car bearing the No. 1. He is Jenatzy, the Belgian, representing Germany, who is to drive the German car owned and nominated by an American of wealth—Robert Graves. Graves is on the spot, and exchanges a few words with Jenatzy, as does W. K. Vanderbilt, Jr., the donor of the cup and the referee of the race. Vanderbilt is wearing his familiar black satin coat, and beneath it a gray sweater, the better to keep out the early morning chill.

The starter tolls off the minutes, then the seconds:

"Three! Two! One!"—Mrs. Vanderbilt, in a box overlooking the scene, animatedly beats time in unison with the starter's count—then a pump handle motion of the arm, a shrieked "Go!", a big puff of smoke, a fairly hearty cheer and Jenatzy slips easily away and is lost in the distance even before the sixty seconds have elapsed when "Go" is shouted into the ear of Duray in the big blue De Dietrich. Dingley, attired in khaki and driving the "little" Pope-Toledo—the 50 horsepower car that won the American eliminating trial—is No. 3. A really hearty cheer rewards him as he starts. It was his only cheer. Silence was his portion when next he passed.

No. 4—ah! Lancia, the dashing, smiling Lancia. If he is concerned or nervous ever so slightly there is no sign of it. There is no smoke pouring from his car. It is thundering and belching fire, but the flame is blue and bright, but, strange to say, one tongue of it actually is licking his left front tire. It seems odd that this should be the case, but Lancia, he must know and must have weighed the chances. Keene, Wagner, Tracy—looking like a wax figure, so pale is he, and with an orange hued kerchief about his neck—Tracy who had cracked a cylinder only the day before and who had worked the livelong night that he might be here—Nazzaro, Warden—another victim of cracked cylinders—Szisz, and then No. 11—Christie—but Christie is missing, yet scarcely is missed so quickly do the minutes fly.

Cedrino, another swarthy citizen of Italy, he is there; so is his wife. She is nervous, very. She pinches her lower lip. She makes to speak to her husband, but he is off and away before she can edge close to him. Campbell, with an X on his radiator to dodge the superstition saturated No. 13—Heath, who waves a goodby—Lytle, Chevrolet—then another break. No. 17, Clarence Grey Dismore's German entry, which failed to reach these shores—Hemery, White, Sartori—they are all away.

The spectators settle back. Some of the officials speak in half whispers of Christie's absentation. He has sent no message of explanation. None knows where he is—not even the bearded "Jimmy" Breeze, who is supposed to own the Christie car and in whose name it was nominated. Breese is on the spot, wearing a badge and a buttonaire and other indications that he had surveyed himself full in the mirror despite the early morning hour. There is talk that eleventh hour family objections had prevailed, and that Christie has flunked. There also are some stronger expressions—much stronger ones. The man puts his megaphone to his lips, and Christie is forgotten.

"No. 1 has passed Willetts avenue," he announces.

It is the first of very many messages that the splendid telephone service delivered and that kept the spectators so well informed throughout the whole forenoon. It was a busy forenoon for the megaphone man. He earned every cent of his fee.

First—AUGUST HEMERY, FRANCE.

Second—GEORGE HEATH, FRANCE.

The sun has dissipated the slight morning mist. The sky is fleckless blue. It is a glorious day—one of those rare days in October. Already is the chill of early morning well removed. "Society," in the cars and the stand, has removed or is removing her expensive furs or other wraps; it reveals equally expensive morning toilets. Common democracy, not in cars and not on the stand, is removing top coats and sweaters. . . . The bugle blows a-down the road. The call is echoed by the bugle outlined against the sky atop the press stand. . . . "Car coming!" . . . It is Jenatzy. He tears past at a terrific pace. . . . Again the bugle. Again the echo. . . . A wave of comment sweeps the crowd. . . . It is No. 4. No. 4 is Lancia. Already he has passed Duray and Dingley, two of the three men who were in front of him. He has made big gains in the first twenty-eight miles. . . . He hurls by like a thunderbolt. He knows that he has done good work, for his face is wreathed in smiles. The crowd, too, knows it without awaiting the megaphone announcement. It cheers—cheers heartily. Lancia hears it. His smile appears to widen and he waves his hand. The megaphone gives out that Lancia's time for the 28.3 miles is 23:49, and again that wave of admiration stirs the multitude. It is sustained speed such as Americans have never witnessed since their nation first established a highway; and these roads are not the best that America now holds. Seventy-one miles per hour! It is speed that staggers belief. . . . Keene thunders by. . . . Mrs. Vanderbilt leans far over the rail and follows him with her eyes until he is a mere speck in the distance. . . . Keene is of the "Vanderbilt set," you know. . . . But the little lady in white with a green feather stuck in her hat assumes so many attitudes during the forenoon and holds some of them so long that there is ground for suspicion that she likes the click of the cameras centred on her, or poses merely because she fancies posing is becoming. . . .

At 6:38 comes the cry "Here's Christie!" and, sure enough, it is the forgotten and derelict American. His low hung car is sounding its deep, sonorous rattatoo, but there are false notes—missed notes—discernible. He approaches slowly and makes as if to stop. "Jimmy" Breese is all excitement. Referee Vanderbilt seems to share it. Before Christie halts, and although a moving start is contrary to the rules, the referee runs out into the centre of the road and waves him on. Christie goes; but not fast enough to excite comment and with not one

THE SCORE BOARD.

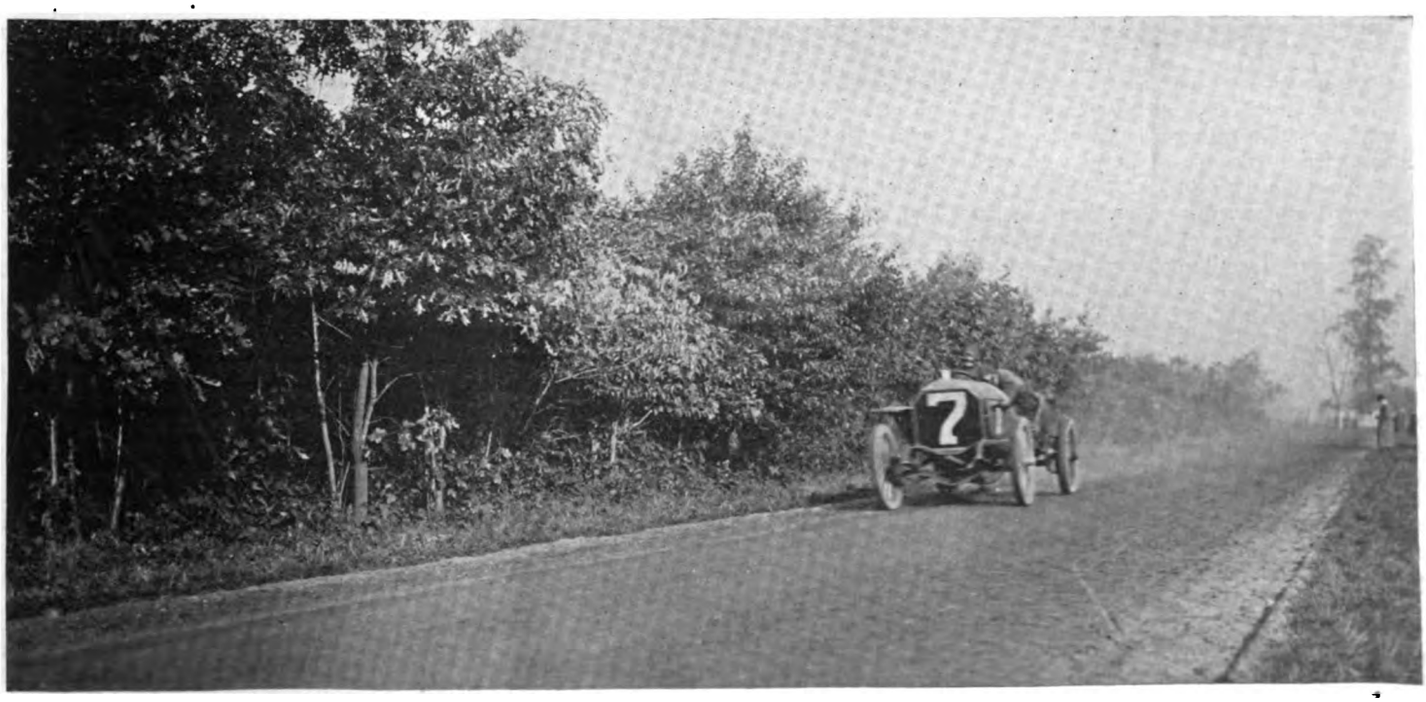
Third—JOSEPH TRACY, AMERICA.

Fourth—VINCENZO LANCIA, ITALY.

hand of encouragement. His engine appears to labor. There is a report that it also had suffered in the epidemic of cracked cylinders. . . . It is nearly an hour before the Breese with whiskers sets eyes on his car again. Few others take notice of its passing.

* * * * *

The story of the first passing of the cars as seen from the official stand is practically the story of each successive period marked by that point.



On the second lap Jenatzy was still in front, but Lancia was pulling him down rapidly. The Italian had gained 63 seconds on the German in the first lap, and he gained 62 seconds on the next round, although Jenatzy had quickened his pace some 20 seconds. Lancia did the two rounds in 23:49 and 23:31, respectively; Jenatzy in 24:52 and 24:33. Lancia had come to America with a great reputation. He was living up to it, and the spectators were not slow to realize the fact. They warmed up to him quickly, and at the end of another lap they had eyes and interest only for him. All others were practically lost sight of.

It was "all Lancia."

He passed Jenatzy on the third approach to Bull's Head—which is the right angled turn near Wheatley Station—but he never let up. He kept crowding the pace, which reached its climax on the fourth round, which was negotiated in 23:18, or seventy-three miles an hour. That was the fastest lap of the race, and of the nineteen contenders Lancia alone got under 24 minutes; and he did so no less than six times. Szisz, in the beetle shaped Renault, did 24:29, which was the next best performance. For seven laps, or 198 miles, when accident befell him, the Italian averaged 69.9 miles an hour.

Is it any wonder that, though he failed to lift the cup, his glory is so great?

Apart from the hurricane speed that was so terrific as to stagger comprehension, the grandstand received its first real thrill on the second lap. An instant before Wagner (Darracq), moving at a pace of sixty-eight miles

TRACY (LOCOMOBILE) CROWDING "ALL ON" ON A STRAIGHT STRETCH OF THE GLEN COVE ROAD.

Digitized by Google

an hour, crossed the line, his right rear tire exploded with a tremendous report. Whole sections of his inner tube flew high into the air and were picked up fifty yards apart. The explosion brought the dense and curious crowd beyond the barrier onto the road, and the officials watching his flight shuddered at the prospect. But Wagner was equal to the emergency. He wavered from his course scarcely a hair's breadth, the crowd parted, and when he had slackened pace he threw up one hand as if to let the officials know that he had full control of the car and that all was well.

"Fine work, that," commented one of them. And it was fine work.

It was but a few minutes later that the officials had a scare of which the spectators knew nothing. Word came over the telephone of an accident on the Willetts road. None knew what it was, and no particulars were forthcoming. The operator was seeking information in rather a loud voice.

"Easy, there, easy—speak softly," cautioned the alert associate referee, A. R. Pardington.

His caution proved wise on an occasion when rumors were travelling fast and assuming exaggerated form in no time at all. Word soon came that the accident, whatever it was, had been righted.

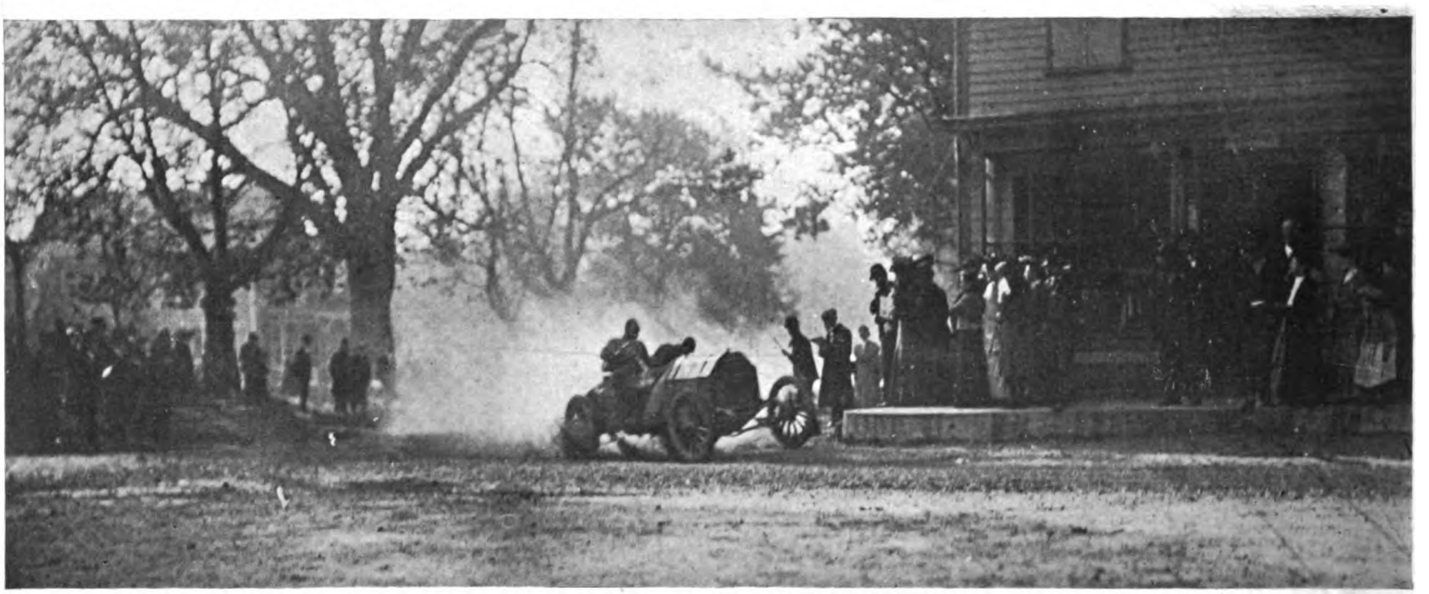
It was a bad day for the American team. Christie had started a full lap behind and was not a serious factor; White, on the first round, had "run into the barn at Bull's Head"—the report became frequent during the forenoon—for water or something else and was also out of the reckoning; Lytle had smashed into a big dog near Mineola, on the second round, and buckled his distance rod and stood no show, and on the third round there remained only Tracy, in the Locomobile, and Dingley, in the "little" Pope-Toledo, as it was generally termed.

Word came on the third round that they had passed Hyde Park together, and the American public then saw a running fight between their sole remaining "hopes." After a fashion, they "had it out" all the way up the Jericho turnpike. Passing the grandstand Dingley was leading by thirty yards. Tracy seemed cautious about attempting to pass, and they passed out of sight in this order at a pace which all could see was not comparable with that of the foreigners. It was nearly two hours before Dingley was seen again. An inlet valve broke and, dropping into the cylinder, played havoc with it. He was announced as out of the race, but by heroic work a repair was effected and Dingley restarted with the hope of finishing "no matter how." He kept going until the contest was ordered stopped.

After striking the dog at Mineola Lytle discovered the buckled distance rod, but believing it to be strong enough to hold together he proceeded slowly on his low gear. The accident had thrown his wheels out of whack. In the Guinea Woods, on the Glen Cove road, one of them began acting so dangerously that his chauffeur, Tattersall, was dispatched afoot to find a substitute.

This gave rise to a series of the most conflicting rumors it is possible to conceive. Without awaiting the return of Tattersall Lytle elected to "take chances."

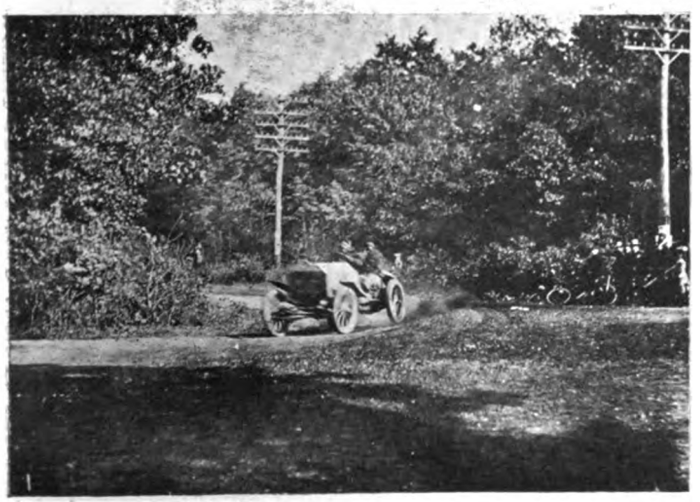
"Lytle has dropped his mechanic and is driving alone," was the first report that came over the telephone.



"Lytle does not know where he lost his man, but says the fall won't hurt him, as he is a football player." "Lytle is lost; his man is driving the car." "Lytle's man landed on his head in the ditch." "Lytle's man is reported lying in a ditch in the Guinea Woods." "Lytle's chauffeur broke his neck."

These and other alarming reports of the sort were received in response to every effort to obtain definite information. Finally Referee Vanderbilt and a physician hurried away in Mr. Vanderbilt's own racing car. They were absent some time, but when they returned "nobody hurt" was announced. All the while Tattersall, about whose supposed death all were so greatly concerned, was footing it lackadaisically along the roadside.

Lytle picked up another man, and after changing wheels covered one fairly fast lap and a rather slow one, each time passing the stand with a plume of steam flying from his radiator chimney and with water spouting from it like a fountain, his chauffeur making frantic efforts to protect himself from the hot fluid that was dashed into his face at every pound.



The behavior of White, the only American to suffer much tire trouble—he shed two tires—was past understanding. He made a holiday of the race. He went "into the barn at Bull's Head" regularly each lap—apparently for water, but as the door of the barn was closed in the faces of the curious none can say with certainty that these excursions were for water. At about the time he had been forgotten would come the report, "White is going again"; then he would alternately speed and loiter over the course, only to again disappear in the barn. Although about 140 miles behind the leader, he was still meandering toward the barn when the crowd stampeded and forced the stoppage of the race. His performance was one of the bitterest disappointments of the day.

There was once that White varied the monotony of "going into the barn at Bull's Head." It was on his fourth lap—it is necessary to emphasize the "his"—that for a change he literally "took to the woods." In rounding the Guinea Woods turn on the Glen Cove road he miscalculated his speed and to avoid striking a telegraph pole he ran full into the bushes and undergrowth and then emerged on the other side of the pole. White's ill luck pursued him every foot of

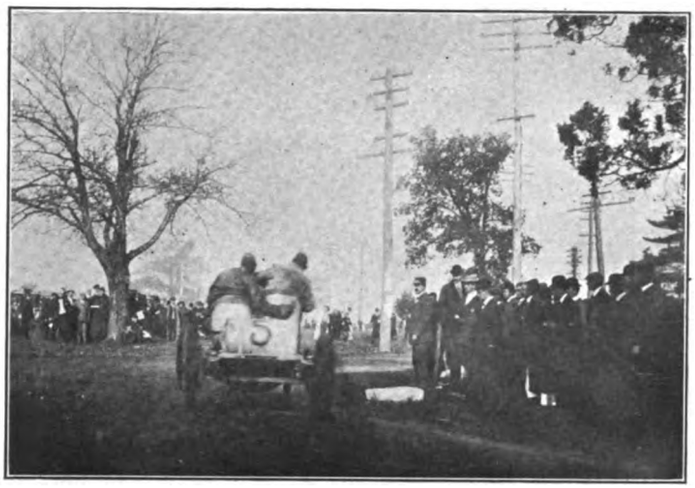
the way. On one of his very many stoppages he borrowed a bicycle to go to the famous barn for some needed part, and en route even the chain of the bicycle broke.

Christie, the fifth member of the American team, stood no earthly show at any stage. Its performance after the substitution of his cranky car after its failure in the elimination trials amply justified all the hard things that were said of the car and of the Cup Commissioners, who threw out the Thomas racer that the Christie might compete in the cup race itself. Christie's family strenuously objected to his driving, he himself tried to beg off, and he even developed rheumatism and carried his arm in a sling. At the eleventh hour a cylinder is supposed to have cracked, and it would have redounded to the credit of America, if not to himself, had he never repaired it. Before he and Lancia collided he had torn off a tire, of course, and at Bull's Head he stalled his engine. The crowd there gave him a hand, and, after he had been pushed off, the car waltzed all over the road. It would have been a mercy had he and White run into some barn and locked the door so tightly that they could not get out again that day.

Lytle's damaged distance rod held together until on the fifth round, when, with the strained steering socket, it gave way near Lakeville. He, of course, lost control of the car, and, with few to see it, it spectacularly ran off the road, demolished a rail fence and charged into a potato patch. There it halted, right side up and with no injury done save to the fence.



Tracy, the one remaining hope of America, ran like a clock. He stopped only to replenish supplies and to scrape a slippery clutch. Otherwise, as the figures by laps serve to show, he ran steadily and surely, if not spectacularly and meteorically. The statistics show that the men who finished one, two, three were the steady goers. Tracy finished third by virtue of his steadiness. Few of those who saw him perform and place the Stars and Stripes higher even than most men had dared hope knew the odds under which he had labored. The day before he had cracked a cylinder and done some other damage. Word was quickly sent to the Locomobile factory at Bridgeport. There was no train due, so the needed parts were loaded into a Locomobile touring car and rushed to Long Island. It was midnight before the damage was remedied; it was after midnight before the car was weighed in; it was 4 o'clock Saturday morning before the engine was turned over. It worked at the first turn, but there was no chance for "tuning up"—no chance for a "try out." It all adds to the wonder that Tracy and his car performed so grandly, so greatly to the glory of America. After the fourth lap his countrymen awoke to the merit of the splendid work he was doing, and thereafter cheered him heartily.

WHITE STOPS TO TINKER.

If the American team was all but eliminated, so, too, was the Italian team, while the German representation was completely wiped out. True, Nazzaro and Sartori, of Italy, and Warden, for, if not of Germany, were still circling the course when the race was ordered stopped, but so, too, were White and Dingley of America, but all were from twenty-eight to fifty or more miles behind the leaders and stood no earthly show. "Herr" Campbell, who fell heir to No. 13

after "Herr" Keene had wailed so loudly that it was removed from him, was the very first man to be bowled out. As salve for his superstitiousness Campbell was permitted to display an X instead of the figure 13, but it did not save him. On the second round a hole was punched in his gasolene tank, and that was the end of him.

On the third lap Jenatzy, chief hope of the German team, and Warden were reported stopped at Bull's Head. Both got going again, but on the very next lap, at the same place, Jenatzy went down and out with a cracked cylinder. Warden then had more than his share of tire trouble. One tire went flat and compelled a stop at Lakeville. Then another flew off in the Guinea Woods, and the wealthy American who was playing German for the day went on without it. It was replaced, but another one was lost at Hyde Park, and Warden limped by the grandstand far to the side of the road, bumping on one rim. Keene, though successful in escaping No. 13, did not escape accident, and came close to serious injury. He was performing well, when on the sixth lap he sought to negotiate the "S" turn at Albertson. There are several so-called "S" turns, but this one is rightly so styled. "Ticklish" enough at best, there are three telegraph poles set not fifty feet apart in the very belly of the "S." The men swung to the right entering the "S" and to the left in leaving it. The three poles are all on the left side of the road.

When Keene, too confident or slightly misjudging his speed, swung to the right, his car skidded straight for the first pole. He saw his danger and quickly shifted his steering wheel. His chauffeur, nearest the pole, saw the danger, too, and, half rising, leaned far over Keene to avoid the impact. He avoided it, but the left front wheel of the car struck the pole with such force that the chauffeur was pitched headlong out of it, and, strangely enough, fell directly in front of the right rear wheel, which partly passed over his chest. The front wheel was wrecked and the axle bent, but Keene kept his seat. The chauffeur was stunned and lay where he fell, partly under the car, but happily he was not seriously injured. Heath was trailing Keene, and, seeing the accident, brought up quickly to avoid running over the prostrate man. He stopped on his high gear, which stalled his engine and lost him some valuable moments before he could again get going.

Heath, the American representing France, was afterward credited with great gallantry and self-sacrifice—even at the cost of the trophy—in stopping to lend assistance to the American thus disabled while in the service of Germany, but he was quick to repudiate the credit.

"I stopped solely to avoid running over Mr. Keene's chauffeur," a Motor World man heard him disclaim. "There were two hundred other men on the spot to render assistance, if assistance was needed."

After his car had been pushed off the road Keene, wearing a rather shabby gray overcoat, made his way to the grandstand, where he remained until the end of the race. He told his story to the Vanderbilts and the Belmonts and to a perfectly lovely man wearing an English hunting costume topped by a pancake hat with a green ribbon band. He remained standing directly under the Vanderbilt box for an hour or so. Several times he wiped his watery eyes with a handkerchief. Some of those who fancy that all is tears that flows from the eye saw that Keene was weeping for disappointment.

Of the Italians, Cedrino was the first to be bowled out. A broken wristpin at the Bull's

DURAY SWEEPING 'ROUND THE BULL'S HEAD CURVE.

Head turn, on the third lap, gave him his quietus. Chevrolet ran with steadiness, if not with dash, until on the seventh round, when, swinging round the "S" turn at Albertson, his left front wheel collapsed gradually under the strain. He must have felt something wrong, for with skill and dexterity that brought a cheer from the crowd he steered clear of the dangerous poles and brought up in the field, where the car came to earth with comparative gentleness. While Sartori was pegging away with a steadiness that surprised his friends, Nazzaro was reported down with a puncture at Lakeville, on the second round, and the time of his eighth lap, 34:40, bears witness of mischief on that circuit.

But the story of the Italian team and of the race is written around Lancia.

Although his fifth lap was nearly five minutes slower than his preceding circuits, when Lancia passed the stand his smile had spread into a broad grin. He was going the greatest kind of great guns, but the grin was unmistakable. He had cause for it. He was not only in front, but in point of time he was thirteen minutes ahead of the next fastest man—Heath. On the next lap the thirteen minutes had been lengthened to sixteen, and on the seventh round, when Heath stopped for supplies, Lancia increased his lead to twenty-one minutes—practically a full lap. It all seemed over but the shouting. Apparently Lancia himself and his advisers thought so, too. On the next lap, the eighth, he stopped at the Michelin tire platform on the Willett's road near Albertson to take on supplies and to make assurance sure, to change his tires. The work had been completed and Lancia was making ready to start when there came the warning cry, "Car coming!" Lancia had already turned on his power and under impetus the car shot forward from the platform at the right hand side of the road. As the forward wheels of his Fiat struck the oiled surface Lancia gave a quick glance over his left shoulder. Christie was at that instant less than fifty feet behind the Italian. He had shut off his power and applied his brake, but the impetus was too great to be checked instantly.

Lancia had thrown over for full speed, evidently hoping to draw away from the Christie car in time. Whether his action was due to a miscalculation of time and distance, or whether, as many of the spectators declared afterward, he was displaying characteristic recklessness, is not clear. The Christie car "side swiped" the Fiat, crushing both the forward and rear wheels of the American machine, which slid for a distance of 200 feet, and then making a complete turn struck the soft embankment at the left of the course with tremendous force. Both Mr. Christie and Nicholas Leightner, his mechanician, were shot from the machine as from a catapult. Leightner was hurled through the branches of a small maple tree and fell in a dense growth of bushes fully twenty feet from the wrecked car. Christie, who was not thrown quite so far, was tossed head and shoulders in the soft earth. The driver arose almost immediately unhurt, but his mechanician lay motionless. He was picked up and later carried to a hospital, where it was found that bruises and shock constituted his chief injury.

Meanwhile, Lancia had sped onward for an eighth of a mile. The crash, however, had buckled his sprocket, and a few seconds later his left hand chain rode the sprocket and ran off. He was compelled to stop for repairs, of course. These took time—valuable time, so much of it, that when the jaunty Italian again got going he was no

THE CROWD SURROUNDING LANCIA WHEN HE STOPPED AT THE GRANDSTAND.

longer the leader. He had been nearly half an hour ahead. He was now nearly half an hour behind. He drove with the recklessness and dash born of desperation.

While all this was happening, the tens of thousands, possibly the hundred thousand, congregated on or in the vicinity of the grandstand, were wondering what had become of their dashing hero. They knew that something had happened, but there was no telephone at the point where the accident occurred and information was not easy to obtain. Referee Vanderbilt himself came over to the telephone booth and inquired, "Where's Lancia?" It was some time before the query was answered.

"No. 4 has burst a tire at Lakeville," the megaphone announced.

A great buzz of sympathy swept the large crowd.

How the report arose is not known, but it was succeeded by one even more dumbfounding:

"Lancia is out."

The crowd was aghast. Few even knew who was the second man, now that the popular idol had fallen. They were still wondering and figuring when there came word of the collision.

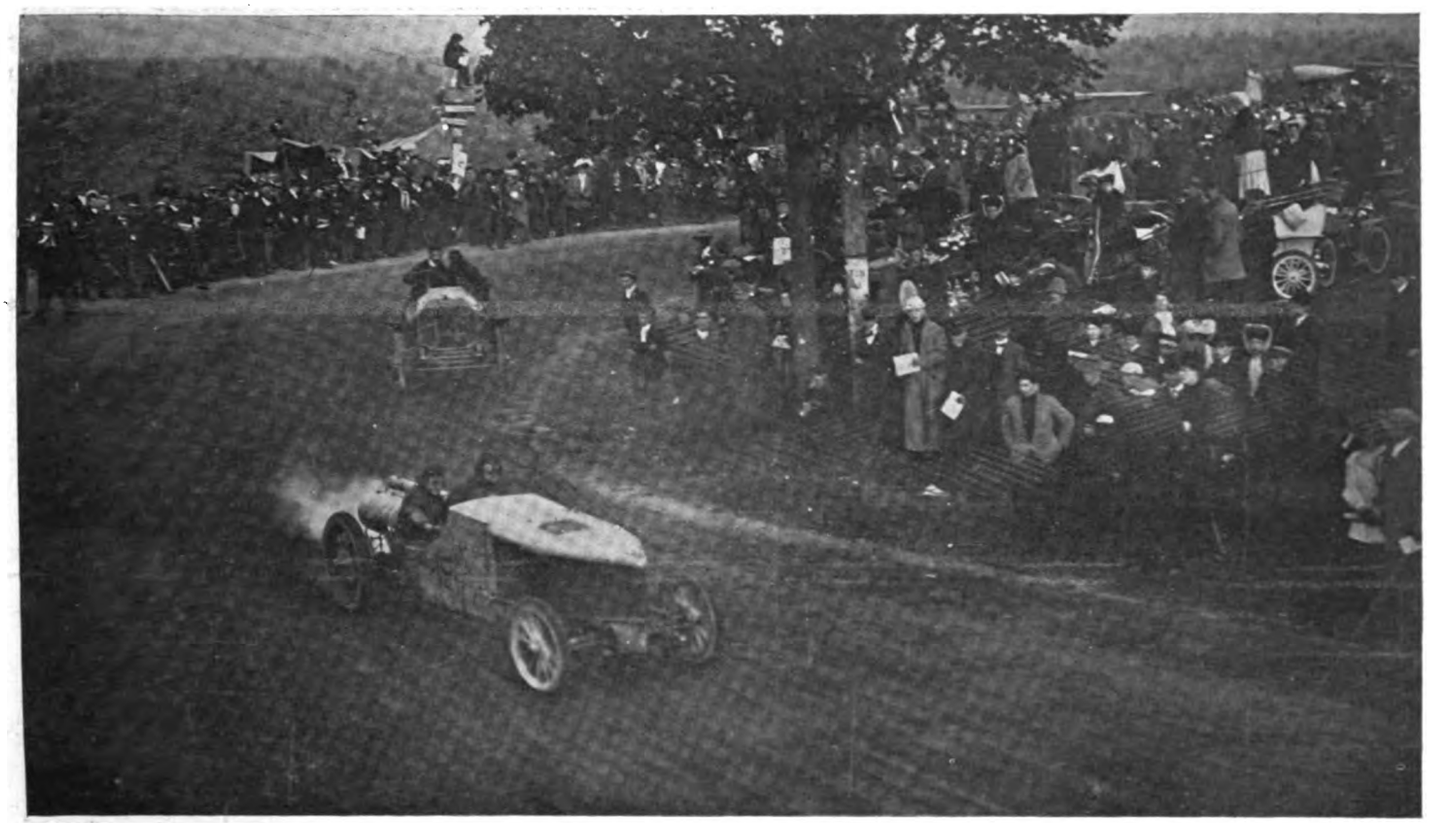
"Leaving the gasolene station at Willetts, Christie ran into Lancia. Both cars are disabled, but no one is hurt," is the way the announcement ran.

There were some strong things said about Christie, his car and every one connected with them.

Then, and not until then, it was that the spectators who had not been "keeping tabs" awoke to the realization that there was such a man as Hemery in the race. They were amazed to find that he had crawled past Heath, and, with Lancia out, had a safe lead in the short distance to go.

But Lancia was not out. The man with the megaphone said so.

"No. 4 has passed Lakeville," he announced.



All knew for whom No. 4 stood. It was the first that had been heard of him since the collision. None even suspected that he was again in the fight. When the truth dawned on them, a mighty shout went up—the mightiest of the whole day. When but a few minutes later Lancia, no longer smiling, but with a deadly earnest face, dashed past at lightning speed, there was another acclaiming roar. But Hemery, Heath, Tracy, Szisz and Nazzaro all had passed him while he chafed in enforced idleness, and each was now a long way ahead. Szisz and Nazzaro fell on evil times in those closing rounds, however, and though in the final lap all was not well with Lancia himself—he had to again stop to have tires and chain readjusted—he passed those two and pushed ahead of Tracy also.

When he halted at the grandstand he supposed that he had beaten the American also. But there had been three minutes difference in the times of their starts, and while Lancia waited, with the stampeded crowd surrounding him, Tracy came with a roar long before three minutes had expired. He beat the Italian for third place by two minutes and five seconds.

There was no smile on Lancia's face. The lower lip had dropped and it seemed as if the big, brave son of Italy might blubber were he much provoked. The bitter in his cup of sweet had come to the top. The man with the megaphone had to climb into Lancia's car and shout loudly that a path might be cleared for him that he might reach the weighing station at Albertson.

The French team repeated its performance of last year. It again secured first and second places, but this time a genuine blown-in-the-bottle Frenchman won and not the make believe American article of the previous race. Heath, the victor in 1904, was the runner-up on this occasion. Hemery and Heath finished in front by virtue of consist-

Digitized by Google

HEATH OVERTAKING WHITE AT HYDE PARK.

ent performance. They kept going all the time. Their stops were few and short. On the fourth lap and again on the ninth Hemery had tire trouble, while Heath had his portion on the eighth round. Both were careful drivers, and Heath especially took no chances on the turns. Hemery rarely looked up, but it was Heath's practice to salute the grand stand on almost every occasion. His wife was there. Perhaps that's the reason. Once passing the stand Hemery's chauffeur lost his goggles, and until the eighth lap this was absolutely the only incident that served to draw attention to them. It was only those who were keeping close record of the times who realized that Hemery was likely to have a "look in." At the end of the fourth lap Heath, Warden, Sartori, Szisz, Keene, Tracy and Lancia, of course, were leading him easily, but in the next round he began to move up. Some of them fell on evil times, and he passed Warden and Tracy, moving from eighth to sixth place. On the next lap he went by all save Lancia and Heath.

Then on the momentous eighth lap Lancia had his accident and Heath also had some minor trouble, and the sulky Frenchman in the black sweater, with "Darracq" spelled across his chest, went to the front and stayed there, though small woes delayed him on the last circuit and enabled Heath to cut down his lead from nearly five minutes to a scant 36 seconds. When they finished both men were acclaimed, but rather mildly. The crowd seemed too absorbed to cheer real lustily or in accord. Not one of the finishers —not even Tracy—received what may rightly be termed a real hearty cheer.

Wagner, Hemery's running mate, was in hard luck. On the second lap one of his French Dunlop tires exploded—the Darracq Company had some difference with the Michelin house abroad and changed their tire equipment at the eleventh hour—and on the third, when near Albertson, he lost his gear case, the grease was thrown out, and in no time at all the overheated gears locked fast and Wagner's long trip across the Atlantic was set at naught.

Szisz, in the Renault, did some really remarkable work. His first three laps averaged faster than all the others save Lancia, and on the fifth round he gave the grandstand a taste of his real speed. He and Keene came down the long, straight stretch together, "Herr" Keene in front, but with the Frenchman footing faster and gaining with every bound. Keene held the centre of the road, but almost in front of the stand the little red car swung sharply to the left, scattering dirt over the officials. For fifty yards they raced side by side; then the little red car fairly leaped in front of the big white one and drew away with every revolution. But Szisz had had his troubles and was doomed to have more of them. His cooling system had become deranged and time and again he was forced to stop and cool his engine and replenish his water supply, and twice, according to reports, to extinguish fire. How he ever did so well in the face of such difficulties is remarkable. Four of the five Frenchmen were running when the race was called off, Duray, in the big blue Dietrich, being the remaining survivor, who, though troubled, was "still in the ring."

It may well be supposed that after winning such a race the victor would be brimming over with good nature, and there are those who claim to have seen Hemery all agrin and with an overjoyed retinue of Frenchmen kissing the grime off his face. But certainly when he appeared at the Albertson to "weigh out" he exhibited some of the sour surliness that his face reflects. When he dismounted he was given a glass of stimulant. Then seeing a score of cameras levelled at him he made an angry rush at them, while one of his following actually did strike the photographer of Collier's Weekly.

When they dismounted from the Panhard, Heath and his mechanician were all a-tremble; if anything, the man was worse off than the master, and seemed sadly in need of the drink and raw eggs that were quickly handed him.

When he came on the scene Lancia had recovered his smile, and after shaking hands with Heath coolly took out a cigarette and puffed it as unconcernedly as if he had but just returned from a pleasure jaunt of 50 miles instead of a punishing drive of nearly 300 miles, most of it covered at a pace faster than any living man ever before had traveled on unrailed earth.

Digitized by Google

WHEN THE CROWD TOOK POSSESSION OF THE ROAD, REQUIRING THAT THE RACE BE STOPPED.

Only Razzio's average of 64.8 miles per hour in the 311 miles race for the Florio Cup, in Italy, is comparable with Lancia's flight of the first 198 miles in the first 170 minutes of Saturday's race.

While at Albertson Lancia heard the story started by some idiot that he purposely had fouled Christie to put him out of the running. That he had no earthly reason to endanger his own life and his own chances, particularly with such driftwood as the Christie car, was patent; but the report greatly exercised the Italian, and later he took a touring car and drove to the Christie quarters to set himself right and to inquire solicitously about the injured chauffeur.

Heath rather bitterly denounced the inconsiderate crowd that not only intruded on the road but stood in the zones of danger at the corners and kept the drivers' nerves on edge.

When Tracy, obviously very tired, appeared at the scales he was cheered in a fashion by the crowd gathered there that made his drawn face light up; and the crowd did not overlook A. L. Riker, the man who designed and superintended the building of the Locomobile that Tracy drove so well and that was the first American car to finish well up in a speed contest with the best that Europe holds. Riker was also one of the official weighmasters, and the cheer given him caused the big fellow to blush like a school girl.

Some Things Happen to Hemery.

Hemery's good fortune ended with the race on Saturday.

On Sunday, while his car was being viewed by a number of spectators, one of them, after lighting a cigar, threw the unextinguished match on the oil soaked ground outside the garage. A blaze instantly followed. The car was somewhat damaged in its more vulnerable parts, not not enough to affect its operation, as it was in use the following day.

On Monday the surly young Frenchman learned that he could do no more racing for a full year. On that day the cable brought word that for insolence to the officials during the recent Florio Cup race in Italy he had been suspended for twelve months by the Automobile Club of Italy. On Tuesday the cable added that the Automobile Club of France would recognize and respect the action of the Italian organization.

Hemery, who is in no danger of ever becoming popular wherever he may go, is thus barred from all the big events of 1906.

When asked of what his insolence had consisted, he blithely stated that he had bluntly requested the Italian officials to go to hell—a blatherskite expression or desire which he repeated several times over.

The foreign drivers are not strong on receptions—a fact which is not difficult of understanding after one has encountered most of them. Pounding anvils or handling trowels would seem more in their lines. The Automobile Club of America, however, tendered them a reception on Monday night, and exactly three of them attended—Heath, a man of means, Duray and Tracy.

On Wednesday afternoon a professional promoter "tendered" them a dinner in the New York Press Club's aerial restaurant, at which only Szisz, Lancia and Nazaro put in an appearance. There were present, however, a score of newspaper men and others who had received invitations to come and pay $5 each, and several of them made speeches. The omnipresent Winthrop E. Scarritt was there, of course, and for a change read a poem. The most interesting things were said by Lancia and A. R. Pardington. Lancia said he appreciated the cordiality of his treatment and promised to tell "his King" about it. Pardington said that the Long Island authorities had already tendered the use of the course for a race next year.

Nearly all of the members of the French and Italian teams will sail for home to-day. Before leaving, Lancia and Nazzaro made a flying trip to view Niagara Falls.

The Race as Viewed at Lakeville Where Gore was Spilled.

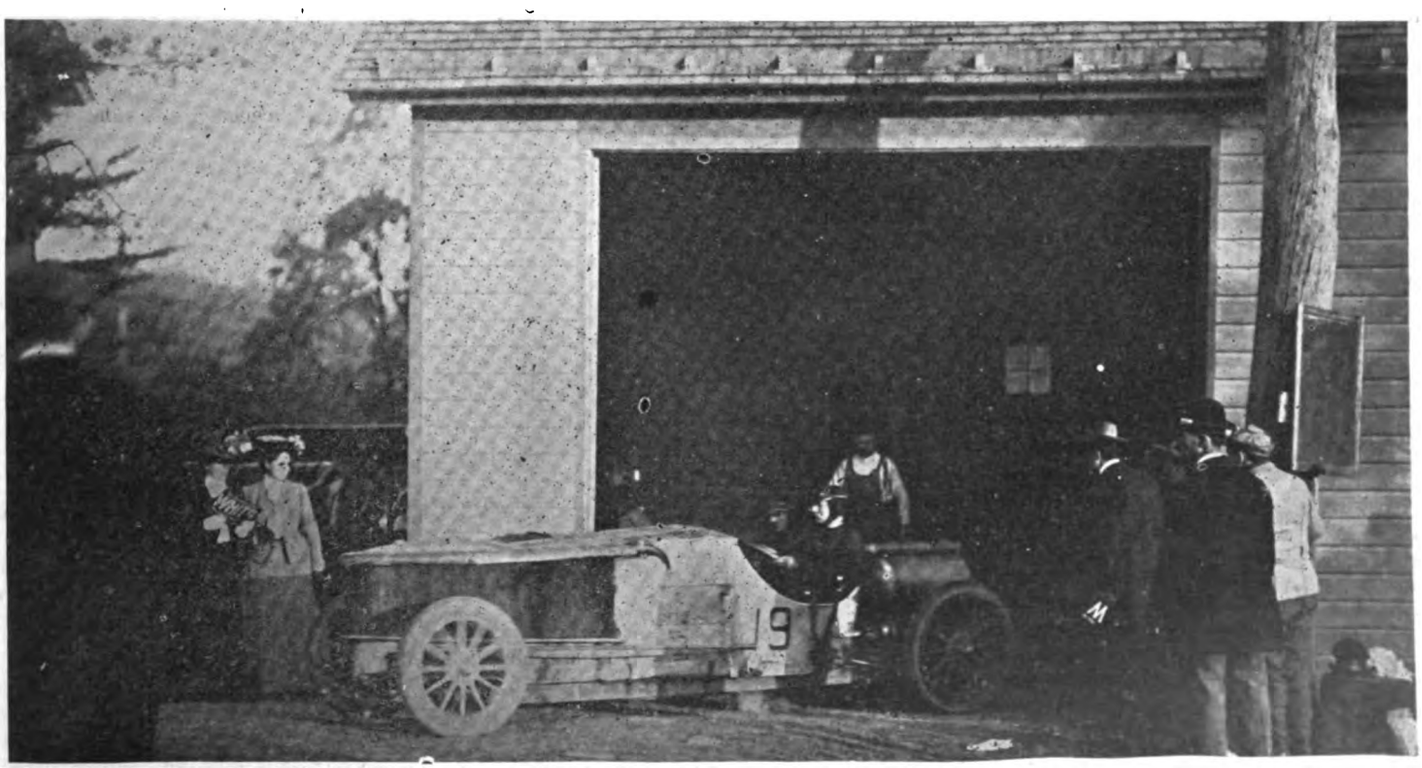
Again was Lakeville, with its so-called "hairpin" turn, "double S" and "curves of death," a disappointment, at least to the eight or nine hundred people who had assembled at this, the worst, angle of the course in the vain hope that the significant "something" would happen. They were doomed to disappointment, for, as in the elimination race, things persistently refused to happen. Only when Lytle, the American, and his Pope-Toledo plunged through the fence half a mile below the crossroads turn was blood drawn, and not a dozen of the watchers were there to see it or were aware of the occurrence. If the spectators were disappointed in that there were no killings at Lakeville, those who could appreciate skillful and daring driving were well rewarded; for here it was that some of the most reckless performances that occurred during the entire race were witnessed.

The scene of peaceful serenity of dawn suddenly was placated by one totally different. A sleepy guard who had been idling on the bank further down the road puffing a corncob pipe jumped to his feet, frantically waved a red flag, and a man with a megaphone in stentorian tones yelled:

"Car coming!"

There was no time to observe the beauties of nature or comment on the radiance and glory of a Long Island sunrise. The great race was on, and keen expectancy was pictured on every face, for each wondered which driver would be the first to appear. Suddenly a car came into view around a bend in the road, preceded by the steady s-p-p-p-p-p-l-t-t-i-n-g of the engine. The figure "1" was painted on its radiator, and there was no need to consult programmes—every one knew it was Jenatzy, the Belgian driver of the 120 horsepower Mercedes and the first of the contenders to be started from Mineola.

"He looks like the devil, for sure," observed one of the spectators close to the guard rope, and the remark seemed not malapropos. Completely enveloped in a long rubber cloak, his head covered by a hood and the entire upper part of his face hidden by a pair of huge goggles and only his moustache and pointed beard unprotected, Jenatzy certainly presented a Mephistophelian aspect. It did not require much strain on one's imaginative faculties to believe the Belgian anything but human. Scarcely shutting off power, the crack member of the German team whirled around the turn and was soon lost to view up the winding oiled road which leads to Hyde Park. The surprise came when Lancia was next sighted. The crowd gave him a cheer. It realized that thus early he had passed Duray (De Dietrich), France, and Dingley (Pope-Toledo), America.



The men all took the turns in fearless style, and nothing happened until on the second round, when a puncture to one of Nazzaro's tires caused a thrill and a rush when he stopped for repair.

The first genuine excitement the crowd displayed was when Warden and Tracy came around on the third lap. The American

driver of the German car was leading by a few yards, and shouts of "Go, on Tracy! Go on! Pass him!" resounded in the air. But if Tracy heard he gave no outward sign, and continued to trail the German. Another time when a mild thrill passed through the spectators was when Lancia appeared on his fourth round.

Just before reaching the turn Christie, who was on his first lap, by the way, hove in sight, with Lancia coming up from behind almost three times as fast. A collision seemed unavoidable, but without shutting off power the daring Italian swung his car to the left up a slight bank, passed the American, was back on the oiled surface and around the turn before the crowd realized the skill required to perform the feat. When they did realize it their throats attested the fact.

Dingley was scored soon after Christie disappeared, and that was the last heard of him until after Lancia had passed on his eighth lap. The telephone man could not learn the whereabouts of the little Pope, but heard it had cracked two cylinders somewhere between Lakeville and Mineola.

Lytle's car was missing badly when he appeared on his third lap and his mechanician was working the pump for dear life. Hardly had the American skidded around the curve than appeared "Herr" Foxhall Keene, "Monsieu" Heath, Szisz and Tracy, all completing the fourth lap. Lancia then followed on his fifth lap, and he was given a hearty ovation, for, barring accidents, it looked an easy victory for the daring Italian. The jovial son from the land of spaghetti and garlic reached Lakeville at 8:26 on his sixth circuit, and exactly twenty-four minutes later had completed another round. That was the last seen of him for nearly two hours, and anxiety increased when Nazzaro, the former's team mate appeared.

Up to this time Nazzaro had been driving very conservatively, but now he urged his car forward with an abandon and recklessness that was marvellous to behold. Reports that Lancia had met with a fatal accident reached the now excited spectators and a groan went up. No official information could be obtained. The first news of Lancia was brought by himself when he reached the right angled turn at 10:02, driving even more superbly than before.

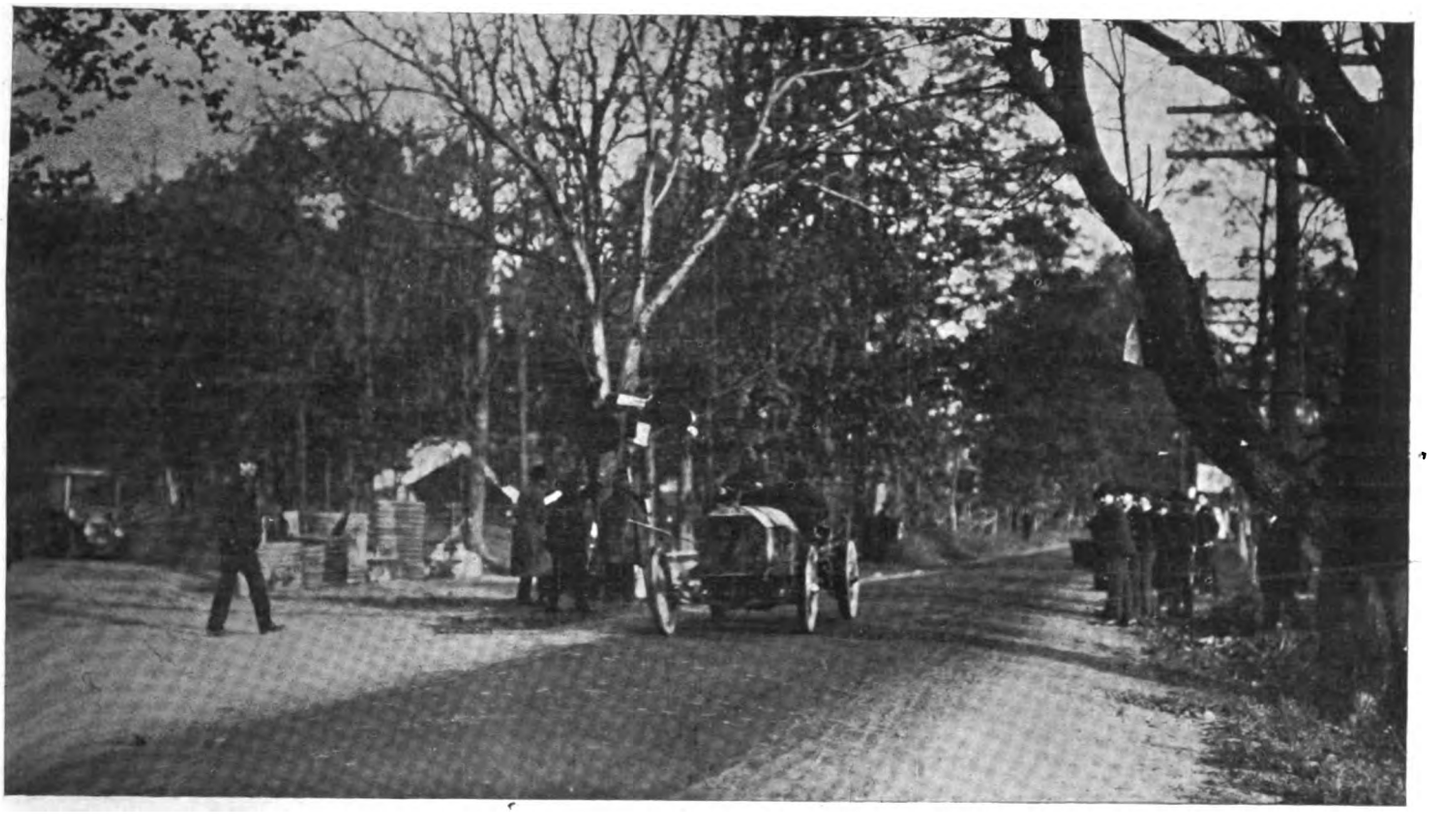
Of the American cars, the Locomobile was easily the favorite of the crowd at Lakeville—the two Pope cars, the White and the Christie were never considered serious factors. The White made three slow rounds, and when it reached Lakeville on the fourth the left front tire was missing. Walter White pulled up on the platform of the Diamond tire control at Lake Success, and lost twelve minutes while the crew fitted a new tire. White did not seem to care whether "school kept or not." When the tire men had completed their work White turned to his mechanic and said: "Well, Johnny, jump in; we might as well try to keep going." White said he had lost the tire at the Guinea Woods turn and had come slowly from there to Lakeville on the rim. That Walter White was unpopular with the foreign drivers—at least some of them—was proved by an incident that happened while the tire was being put on at Lake Success. Nazzaro was coming up the hill when he espied White laid up at the control. He nudged his mechanician, and the latter grinned, gave a triumphant Italian chuckle and yelled:

"Stia bene! Cattivo cano Americano!"

"Do you know what he means?" inquired the Motor World man of White.

"Yes," he replied, nonchalantly. "Just because I wouldn't run my car off into the ditch during practice trials throughout the week and let them pass me they take pleasure in calling me a miserable American dog."

THE MESSAGE TO THE GRANDSTAND.



White made one more round, reaching Lakeville at 9:53. That was the last seen or heard of him.

Herbert Lytle, the American driver of the 75 horsepower Pope-Toledo, caused the only blood to be shed in the race. At Mineola, on his second round, he ran into a big Newfoundland dog, to the total demolition of the latter, and he and his mechanic were bespattered with blood. The collision with the dog caused the casting in the steering box, where the distance rods are connected to break. Lytle continued in the race, but drove very slowly. He stopped at Lakeville, on the second round, to "line up" his steering wheels. Dingley was also laid up here by an intake valve breaking and dropping into the cylinder. Dingley helped Lytle straighten the tension rod, and then both drivers paused long enough for a little girl to take a "snap" of them.

When Lytle stopped at the Diamond station on the fourth round to take on water and cool his cylinders he seemed very nervous. It was on the next lap that he came to grief. About half a mile before the first crook in the "hairpin" turn is reached the cracked casting gave way, breaking the distance rod. The car plunged through the rail fence, described a semi-circle and finally came to a standstill. Lytle and his mechanic jumped from their seats after the car stopped unhurt. Neither had received a scratch. The only damage the car received was a bent radiator and a pierced tire.

The flagman who was stationed at this part of the road had a narrow escape, however. Thinking the car was just skidding when it first began to run amuck, he climbed to what he considered a point of safety—on the top bar of the five rail fence. The big Pope ploughed through the fence as easily as if it had been so much cardboard and came within two feet of hitting the guard. As it was, he was hurled headforemost to the road and

WARDEN (GERMANY) IN FULL CRY; DIAMOND TIRE CONTROL IN BACKGROUND.

escaped with a few bruises, more frightened than hurt, but hurt enough to draw blood from a few scratches on his cheek.

Of all the drivers who passed Lakeville none took the curves with more grace or daring than did Lancie, although Sartori drove a much better race than even his employer had calculated upon. Szisz, the dapper little Hungarian with the totally uncalled for name, nearly came to grief on one lap. Just past the right angled turn the road describes the contour of a double "S," skirting the Vanderbilt estate. Szisz attempted to negotiate each of the small curves at full speed, and at one of the bends his car skidded badly. He missed a telegraph pole by less than six inches. "Monsieur" Heath took the curves beautifully, as did Duray and nearly all the other drivers.

Very little attention was paid to Hémery, the Frenchman, who ultimately won the race, until the ninth lap, when he passed Heath just before reaching the second Lakeville turn. Then followed Lancia, Tracy and Szisz, also on the ninth. Hémery was the first to come around on the last lap, and Heath was only a few seconds behind. Then came Lancia, going like the wind, followed by Tracy, running better than ever. These four were the only cars to pass Lakeville on the last circuit. Both American and Italian were given a cheer that must have been heard a mile away.

Then the flagmen held aloft their yellow banners, the crowd swarmed over the course, and those who were fortunate enough to possess a motor car, cycle or a horse, or knew some one who did, "hiked" toward Mineola to learn the result.

Some Sidelights on the Race.

When the White and the Christie cars were performing so sadly E. R. Thomas, the Buffalo manufacturer who built the six cylinder Thomas racer that qualified in the elimination trial and was then cast out by the cup commission to make room for the more favored cars, was asked what he thought of the situation. He smiled a sad sort of smile.

"There are some things that speak louder than words," he said. "It is unnecessary—it would be almost sacreligious for me to express an opinion. There are some sins of commission the weight of which, the sinners cannot escape. The load which the sinners in this case are bearing is already so heavy that they must feel it keenly. I prefer to be charitable and not add to the weight of their burden."

If there is any man of consequence in the trade who was not present, it requires hard thinking to name him. Practically every man who did not avowedly come to New York to see the race discovered on Friday that business called him there. One traveller who arrived on that day expressed the situation very tritely.

"There's no use trying to do business," he said. "Every dealer and manufacturer within one thousand miles of New York is either here or is on the way."

There was not a little betting on the result of the race. Most of the wagers had to do with the relative positions of the American cars, but two well known tire men picked Lancia against the field and put $50 against $400. On the seventh round, when the Italian was nearly a lap ahead, they were extending invitations to their friends to join them in spending the $400. At the end of the tenth lap their hands were in their pockets. An equally well known accessory manufacturer wagered $300 to $100 against Szisz, and won, of course. Tracy against Lytle, at even money, was a popular bet, and caused much money to change hands. An even more popular wager was that no American would finish within the first five positions—a wager which Tracy's splendid performance upset badly.

Between noon and 7 o'clock Friday evening more than eighteen hundred automobiles were carried by the Thirty-fourth street ferry plying between New York and Long Island City. The boats were run under five-minute headway, and each carried from twenty-six to fifteen cars. How many were carried by the uptown ferries and how many crossed the river via the two bridges there is no means of estimating. There must have been all of five thousand cars parked around the course.

The joke of the occasion was the Long Island Railroad's "special train service." The regular train which left Long Island City at 5 arrived at Mineola before the "specials," which departed at 3:35 and 4 a. m. The latter were so heavily overloaded that the switch engines were not equal to the task of pulling them, and both were stalled en route and did not reach their destinations until long after the race had been started.

GRAND RAPIDS IS HOAXED.

"Undefeated Frenchman" (Never Raced Before) Meets Oldfield—Scheuffler Win Thrice.

Not until Barney Oldfield and his pretentious retinue had departed for other fields to conquer did the good people of Grand Rapids, Mich., awake to a full realization that they had been hoaxed, and that right badly, too. It all happened on Saturday afternoon, 7th inst., and the occasion was the third annual race meet of the Grand Rapids "Auto" Racing Association, held on the one-mile track at Comstock Park. For months previous the daily newspapers had been full of Pickens's advance reports to the effect that "at great expense the racing association had secured Le Fevre, the daring and as yet undefeated Frenchman, to race against Oldfield."

When the "as yet undefeated"—probably because he never had a chance to be—Le Fevre drove on the track with a stripped 35 horsepower Peerless, then the crowd of a score or two more than two thousand people began to do some rapid thinking. And the more they thought the madder they became. How they discovered that Le Fevre is the young man with the French name who sometimes assists Oldfield in getting his car into shape is still a mystery; but they did discover it, and then followed some pretty sulphuric remarks which would not look well in a missionary tract.

There is not much to be said about the so-called five-mile match "race," except that the ubiquitous Barney gave the "snail eater" three-quarters of a lap handicap, overhauled him at the four-mile post and then beat him to the tape by an eighth. The time of the first heat was 5:31 2-5. The second heat was won still more easily.

Beyond this farcical feature the other events were interesting to local motorists, most of them being stock car events and comprising the usual runaways. One thing, however, the little 18 horsepower Jackson performed beautifully and "copped" nearly all the honors. Oldfield appeared once more in a three-mile exhibition, and circled the oval three times in 3:00 flat. His best mile—the last—was the fastest time clocked during the day. The watches gave 59 seconds.

Six cars started in the first event, a five-mile open for cars listing under $1,500. E. F. Scheuffler, driving a stripped 18 horsepower Jackson, took the lead at the first turn, with Ellis, in a 12 horsepower Franklin, following. The little Jackson car ran away from the field, and at the end of the first mile had gained a lead of a quarter over Ellis. Scheuffler increased his advantage each lap, and lapped the field before the finish. Time, 7:10 2-5. Scheuffler's car also won the five-mile "free for all" and finished a good two seconds ahead of G. W. Hart's Franklin.

Summaries:

Five miles, for cars listing under $1,500—E. F. Scheuffler, 18 h. p. Jackson, first; J. Ellis, 12 h. p. Franklin, second. Time, 7:10. Also ran—J. H. Poisson, 18 h. p. Mitchell; J. E. Thomas, 16 h. p. Rambler; Charles Boyden, 18 h. p. Rambler, and E. W. Nowstine, 12 h. p. Franklin.

Five-mile match between Barney Oldfield, 60 h. p. Peerless, and Le Fevre, 25 h. p. Peerless—First heat—Won by Oldfield. Time, 5:31 2-5. Fastest mile—Second, 1:00 2-5. Second heat—Won by Oldfield. Time, 5:28 2-5.

Five-mile exhibition—E. H. Scheuffler, 18 h. p. Jackson. Time, 6:18 1-5.

Five miles, free-for-all—E. H. Scheuffler, 18 h. p. Jackson, first; J. Ellis, 12 h. p. Franklin, second. Time, 7:21. Also ran—Poisson, Thoma, Boyden and Morse.

Dewar Cup Race Declared Off.

Because it has been announced, several of the cars participating in the Vanderbilt race had been damaged, the race for the Dewar Cup, which was scheduled to have taken place on the Coney Island Boulevard, Long Island yesterday (Wednesday) has been declared off. The second race for the trophy, designated by some as emblematic of the mile championship, by others fondly recalled as the time when joyful exuberance was rampant, will therefore be held in connection with the forthcoming Florida beach carnival.

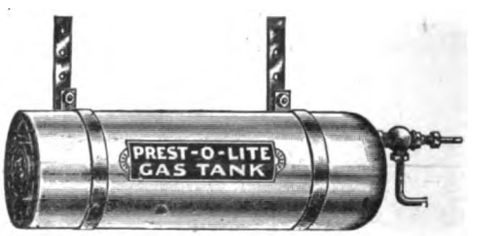
The Incomparable WHITE

The Car for Service.

THE WHITE RUNABOUT



If seating capacity for two is sufficient for your needs, you would do well to inspect critically the White runabout. It, of course, possesses all those qualities of simplicity, durability and reliability which have made the White the favorite touring car of this country. In addition, is the increased speed which results from the lessened weight. The price, furthermore, is less than that of our touring car. The White runabout should certainly appeal strongly to those who wish a stylish, speedy and silent car.

Write for further details regarding price, weight, etc.

TO SEE THE INSIDE WORKINGS

Marvelous Instrument that Either Mirrors or Photographs the Engine's Internal Operations.

It is little short of a miracle that the modern internal combustion motor operates as it does, for it is almost inconceivable that each of the four strokes constituting the complete cycle of operations can be performed in less than one-fortieth of a second—acting perfectly 36,000 times, hour after hour—particularly when it is considered that a flame fills the cylinder during the exhaust strokes and that its place is taken immediately afterward by an unignited explosive mixture, says the Automotor Journal as an introductory to a description of the Carpentier-Hospitalier Manograph, a totally new form of instrument for taking internal combustion motor indicator diagrams.

That this fact is far from being appreciated by the average owner of a car and probably by not a few manufacturers as well, forms an eloquent testimonial to the extraordinary success of such engines in practice, and suggests, moreover, an explanation as to why some engines work very much better at times than others, as well as why some engines give very much better results than others of the same size. It is almost beyond the power of the human mind to clearly grasp the order and rapidity of the operations that actually take place within the cylinder when running at the speed referred to above; that is, about 1,200 revolutions per minute, but it is easy to realize that a minute inspection of every part, coupled with the exercise of a vigorous imagination, is necessary in order to study out ways and means of securing better results. Endless and complicated calculations have been found necessary to determine by theory the correct dimensions and "set" of the various parts, so that the liability to error may be appreciated. Everything occurs in such an extremely short period of time, temperatures and pressures vary over such an extremely wide range, and many of the functions are of such a very complex character, that, even if the engine were intended to run always at a certain constant speed, the correct setting of the valves and the adjustment of the carburettor, not to mention the hundred and one other minor matters, would be little more than guesswork, unless some direct means were available for ascertaining what was actually taking place within the cylinder. Much of the data at present available has been obtained gradually by experimenting on the principle of "trial and error," and fortunately there is usually no lack of visible and audible symptoms which are fairly easy to diagnose. Unless, however, some accurate records are available from which can be seen separately what has occurred during each portion of the cycle of operations, it would be impossible to know whether further improvement might reasonably be looked for or not. Mechanical records showing precisely what has been going on inside the cylinder while the engine is in operation are naturally the only sure method of ascertaining the cause of faulty action and the means of remedying it. But it has been found extremely difficult to make accurate indicator diagrams from engines running at such high speed. Indicators made for steam engine use, however delicately constructed and adjusted, have fallen short of fulfilling the required conditions in that their moving parts are too heavy to act properly at such speeds, both because their inertia has prevented them from getting under way sufficiently fast and because their momentum has caused them to travel too far. Distorted and misleading diagrams have consequently been the result, so that the value of such observations has been very small, if, indeed, they have not been worse than useless.

Although it gives a diagram of exactly the same nature, the Manograph forms a radical departure from the stereotyped instruments generally employed for this purpose. Both the weight of the moving parts as well as their range of travel has been reduced to a minimum. The pencil and paper of the ordinary indicator are equally conspicuous by their absence, while a further difference lies in the replacement of the usual piston and cylinder by a diaphragm. Instead of the pencil a beam of light is employed, and in place of the paper there is a ground glass screen or sensitized plate, such as is used for photography. The light is obtained from a stationary lamp forming part of the apparatus, and the screen upon which it is thrown does not move. These obvious advantages are all obtained by the simple expedient of using a small circular convex mirror, little more than half an inch in diameter, to reflect the beam of light on to the screen. Normally this reflector is in a vertical position in the instrument, but it is arranged so that it may be tilted about its pivot longitudinally or latitudinally by different portions of the mechanism. The lateral movement is transmitted to it by the crank shaft of the engine undergoing the test through the agency of a flexible shaft, and is so arranged that the horizontal beam of light which it causes to traverse the screen corresponds with the forward and backward movements of the piston in the engine cylinder. This beam of light consequently follows the movement of the piston in the manner that the paper does beneath the pencil of an ordinary indicator. The pressure in the combustion chamber serves to give the mirror its longitudinal movement through the mechanism in the instrument which forms part of the apparatus. For this purpose it is piped to the engine, and variations of the pressure cause the mirror to move the beam of light in a vertical path up and down the screen; hence the position of the latter corresponds to the pressure in the cylinder, in the same manner that the vertical position of the pencil does in the ordinary indicator. From this it will of course be plain that the mirror moves in both planes simultaneously and the beam of light accordingly "draws" a diagram of the usual type on the screen.

When the engine attains sufficient speed the complete diagram is reproduced so quickly on the ground glass screen that it is rendered visible in its entirety, and the re-

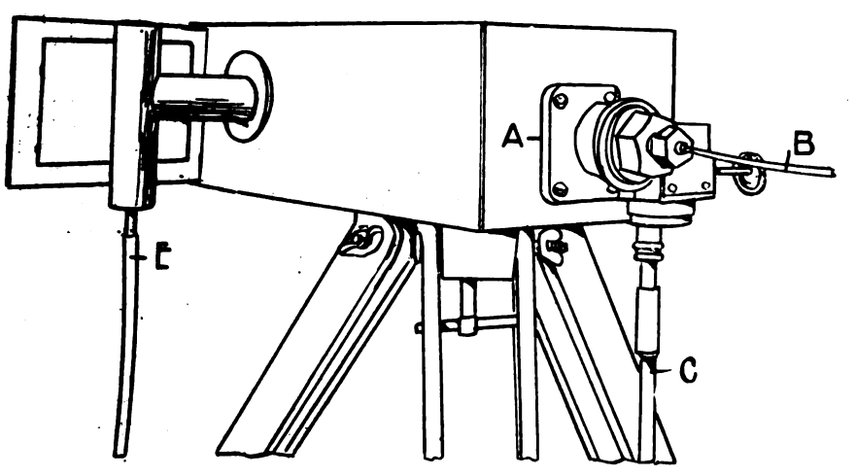

Fig. 1.

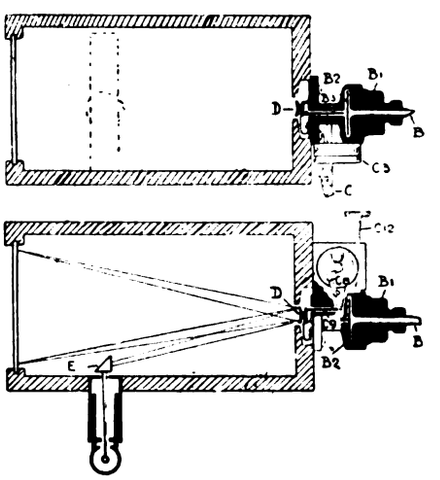

Fig. 2.

Digitized by Google

tina receives a complete image—the diagram standing out as though formed by lines of light. It is thus possible to watch all the changes that may be taking place in the cylinder as they actually occur, although of course by this method no permanent record is produced and the memory must be relied upon to preserve the result. However, by substituting a photographic plate for the ground glass, which is subsequently developed by the usual process, the records may be perpetuated. Photography is also resorted to where the speed of the engine is not sufficiently great to permit of an accurate conception of the diagram being formed by the unaided eye.

The complete instrument, mounted on its tripod, is shown in Fig. 1, and resembles a camera somewhat in appearance. The body consists of a light rectangular box, all moving parts of the mechanism being centred in the attachment A. At the other end of the box is the ground glass screen partly withdrawn in order to be visible. This also forms a holder for photographic plates as in an ordinary camera. The instrument is self-contained and may be set up near the engine to be tested, the necessary connections being shown at B, which is a small tube to be connected to the combustion chamber of the cylinder, the flexible shaft C terminating in a taper plug for coupling to the end of the crank shaft, and the rubber tube E connecting the generator to the acetylene burner in the lamp shown just a short distance in front of the screen.

An idea of the working of the instrument may be obtained by reference to the sectional drawings shown. The light of the acetylene flame is immediately opposite a minute hole in the centre of a disc which would otherwise completely close the telescopic tube connecting the lamp to the case of the instrument. Only a thin thread of light is therefore admitted into the case, and this is directed upon the prism E. The position of the latter is adjustable and its function is to concentrate the shaft of light on the mirror D, from which it is reflected on to the screen, the convex surface causing the rays to converge to a point. Normally the position of the mirror is such that the beam of light is thrown on the screen about three-quarters of an inch above its lower edge, the two movements which the mirror undergoes causing the point on the screen to travel back and forth and up and down anywhere within the range afforded by the area of the ground glass.

The functioning of the entire instrument centres in the mirror, so an idea of the working of the latter is necessary to an understanding of the use of the Manograph. D, the mirror, is balanced on a small stationary pin. The bracket in which the latter is formed is triangular and rigid with the mirror. The two projecting arms of this bracket rest upon movable pins which are normally prevented from tipping the mirror about its fixed fulcrum by means of springs pressing down upon them. These pins may both slide longitudinally in the holes through which they pass in the casting A1 (fig. 2), and they are specially shaped and carefully placed with relation to the shape and position of the arms, so that the movements of the mirror shall correspond to their own backward and forward travel. One pin controlled by the pressure in the engine cylinder causes the up and down movement of the mirror, and the other is given a reciprocating motion exactly following that of the piston in the cylinder. A diaphragm, the outside face of which is in direct communication with the combustion chamber of the cylinder and its variations of movement corresponding to the rise and fall of pressure are communicated to the mirror by a pin, B3. The movements of the diaphragm are naturally not exactly proportional to the pressure, a correction being made for this by shaping the inner end of the pin so that it varies the effective length of the lever arm.

The pin C9 moves back and forth against the spring C10 by the crank and connecting rod C8. The crank pin has but a very short throw, and the length of the conecting link bears the same relation to the throw of the crank pin that the length of an ordinary connecting rod does to the throw of the crank shaft on the average gasolene engine. As a result, the pin C9 is compelled to reciprocate in synchronism with the engine piston, causing the beam of light to do likewise on the screen. It is obviously necessary that the beam of light should arrive at each end of its range of travel across the screen at exactly the same instant that the piston completes its inward and outward strokes. Accordingly, in order to insure means of bringing the movement of the mirror into synchronism with that of the engine piston without disturbing the connection of the flexible shaft and the crank shaft, means are provided for throwing the pin actuating mechanism of this part of the apparatus out of action through the agency of a small clutch. Synchronism of the two is then obtained by using the hand adjusting screw C12. This is readily done accurately in practice by retarding the ignition and watching the shape of the diagram; the completion of the compression stroke can be recognized on the screen and it can be made to occur in the proper place with reference to the working of the instrument.

Compiled data is supplied by the makers of the instrument, showing the relation between vertical deflections of the beam of light and pressures on the diaphragm, thus enabling any diagrams that are obtained to be redrawn accurately for the purpose of calculating indicated horsepower when required. The data are, however, primarily intended for the purpose of permitting the records to be measured for pressure.

Steels for Motor Car Usage.

At the annual meeting of the Iron and Steel Institute, held in Sheffield recently, Dr. Leon Guillet, of Paris, contributed a paper on the steel used for motor-car construction in France. He omitted the subject of tool steels, and dealt only with that used in the actual construction of motor cars.

He recognized the fact that this industry has during the last few years had most influence on the metallurgy of the special steels. He did not regard this as surprising. The wide scope of the industry, the marked difference between the cost price and the selling price of its products, the heavy responsibilities which surround it, the abnormal working to which it subjects metals, the lightness, which is an essential quality, were all circumstances, he said, which had rendered the industry most exacting as to the quality and the property of the metals of which it makes use. Nor did Dr. Guillet think it surprising that the leading firms should have decided to surround themselves with all the most modern scientific precautions as to the acceptance of materials, to study the products most recently launched on the market, and even to inspire the creation of new products that may be adequate to its requirements. He treated, in considerable detail, with the chief special steels employed, of which there are two principal groups—ternary steels (alloys of iron, carbon, and a third substance) and quaternary steels (alloys of iron, carbon, and two other substances).

Innovations in Ignition Devices.

"Dry" is only a relative term as applied to the dry cell, for unless the electrolyte in the cell is moist there is no chemical action set up, and as soon as the latter does become actually dry the cell is dead. Two new cells recently placed on the market, and shown for the first time at an electrical exhibition now in progress in London, take advantage of this principle by sending the cell out entirely dry. When wanted for use it is only necessary to use a little water in the case of one, the "Reeplen," while the "Latent" contains a capsule filled with water, and this is broken when the cell is needed. This obviates the somewhat aggravating experience of finding the "spare" cells, if anything, a little "deader" than those that have just failed and also permits dealers to carry a stock without fear of deterioration.

Among other things of interest to the motorist at the same exhibition were numerous coils and improved tremblers, the Marconi trembler marking quite a departure from current practice. It is pivoted and counterbalanced, the spring being at the armature end, although there is also a small auxiliary spring at the counterweighted end, which strikes against an adjusting screw. The Walker dynamometer was also of interest. This is designed particularly for use with small internal combustion motors, its range being ¼ to 26 brake horsepower. The power is absorbed by the revolution of air vanes, and the speed, being known, the results can be read almost at a glance from the position of the vanes by means of calibrated data supplied with the instrument.

ANNOUNCEMENT

The 1906

Rainier

30-35 H. P.

has arrived. Come and inspect, ye automobile experts—you who really appreciate beautiful workmanship and design and you will admit that at last THE American automobile has come. Look over the following specifications, then call and try the car.

Engine.	30-35 H. P., 4 cylinders, water cooled.
Ignition.	Sims-Bosch Magneto—make and break spark.
Transmission.	Sliding train. 3 speeds forward and one reverse.
Rear Axle.	Bevel gear drive, clutch driven hub. Ball bearings.
Front Axle.	I Beam section. Ball bearings.
Frame.	Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.
Wheel Base.	104 inches.
Wheels.	Imperial whalebone, grade A 2nd growth hickory.
Tires.	Continental 34 x 4.
Valves.	Mechanically operated, inlet and exhaust interchangeable.
Carburetter.	Float feed, requiring no adjustment.
Brakes.	Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
Body.	Full aluminum, double side entrance.
Equipment.	Two head lights, 2 side lights, 1 rear light, 1 horn.

Price, $4,000.

The 22-28 H. P. will be continued as heretofore, without any changes.

4 cylinder—98 inch wheel base—La Coste coil. French battery. Continental Tires. Aluminum side door body.

Price, $3,500.

BOTH MODELS GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

The world's broadest and most liberal automobile guarantee. Landaulet bodies for immediate delivery. Limousines for October and November delivery.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

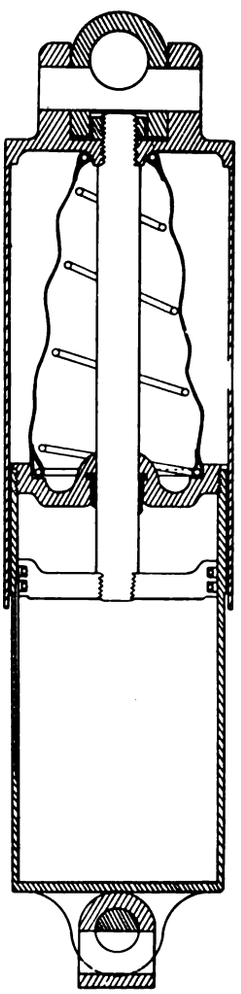
Campbell's Front Wheel Transmission.

Various forms of four wheel drive have been made the subjects of patents during the last few years, attention being in the main directed to the perfection of a drive of this kind for heavy commercial vehicle work in which maximum traction is essential. This can, of course, only be obtained by driving all four wheels. But for the necessity of so mounting at least one pair of the wheels that the vehicle may be directed this would involve no difficulties. The problem naturally centers in this feature.

The universal or Cardan joint was naturally first resorted to for this purpose, but owing to its construction is said to cause difficulty in steering. A recent invention designed with a view to overcoming this feature, as well as others inherent in that form, is the device upon which patents were granted during the first part of the present year to L. W. Campbell, Woonsocket, R. I.



Its appearance, as applied to a Marion air cooled car, is shown by the accompanying photograph, but a view of the mechanism itself is necessary in order to form an idea of the manner of its operation. This may be had by reference to the line sketch. It consists of a gear in the form of an ellipse made fast to the shaft and pinion with curved face meshing therewith. Normally the axis of the pinion and that of the driving gear are parallel, but owing to its form, which closely approximates that of a sphere rather than an ellipse, the angular relation of the axis of the pinion to that of the large gear may be varied at will in order to steer without disturbing the efficiency of the drive, as altering this relation does not change that which the teeth of the two gears bear to one another. This always remains constant, and the full face of the pinion is engaged whether the wheel is hard over or running straight ahead. The inventor claims that the uncertain steer found in the universal joint is thus eliminated.

Vagaries of Steel.

Very often new steel will not pass tests that it should pass, but after a few weeks it is found to have undergone a change and passes the tests right up to the mark. Then, again, steel that was perfect when it was tested often gets "sick." It cracks or becomes brittle, although other steel made at the same time in the same way remains perfectly sound. No man knows to-day why these things happen, but lots of people are trying to find out and are not having an easy time doing so.

"Insides" of the Kilgore Cushion.

Few things are attracting more deserved attention than those means that will reduce or eliminate the heavy shocks that contribute much undesirable discomfort to automobile travel. While the air tire takes care of the vibration, it is becoming generally recognized that the ordinary spring suspension of general usage leaves much to be desired. It follows that such devices as the Kilgore air cushion are receiving and in increasing measure will continue to receive attention.

While the Kilgore, which is now being made by the Kilgore Autotmobile Air Cushion Co., in Boston, is not exactly strange to the motoring world, its "insides" never have been laid bare. The accompanying illustration now performs that service. The principle of the cushion is simplicity itself—two telescoping cylinders compressing a volume of air, one cylinder having a by-pass, or escape, to give gradual release to the air. To render the piston dust proof a distended "umbrella" of chamois skin is suspended in the upper cylinder by a coil spring.

The device has been subjected to some extended tests and has undoubted claims to general attention.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 15 Nassau Street, New York.

THE STANDARD AMERICAN COOLER.

THE

WHITLOCK COOLER

used on Locomobiles, was used on the

LOCOMOBILE RACER that finished THIRD in the VANDERBILT CUP RACE.

It was never touched during the race. It did its full duty.
It held its water and kept the engine cool.

THE ONLY CELLULAR COOLERS MADE IN AMERICA

that were used in the 1905 and 1906 Vanderbilt Cup Races,
also the 1906 Gordon Bennett Race.

Quality and efficiency only figure in an event of this importance.
We make coolers of the HIGHEST EFFICIENCY.
The leading makers of automobiles have recognized
this fact by adopting

THE WHITLOCK COOLERS,

continuously for the seasons of 1903, 1904, 1905, 1906.

THE WHITLOCK COIL PIPE CO., Hartford, Conn.

The Week's Patents.

801,150. Pneumatic Tire. James A. Murphy and William S. Manning, Holyoke, Mass., Assignors to Manning Manufacturing Company, Springfield, Mass.,a Corporation. Filed December 5, 1904. Serial No. 235,000.

Claim.—1. The combination with the casing of a pneumatic tire of the clincher type, of a shoe located in the casing between the latter and the inner tube, the circumference of the shoe being greater than the normal internal circumference of the casing, at the point of the greatest diameter of the latter.

801,155. Folding Hood for Automobiles. Harry Raphael and Emory D. Toops, Indianapolis, Ind. Filed June 21, 1905. Serial No. 266,203.

Claim.—1. An automobile provided with a foldinghood comprising two principal parts secured at opposite sides of the engine machinery thereof, each part composed of a plurality of sections hinged together and folding down one upon another, and latching devices connected to the terminal sections of the two principal parts of the hood for connecting the two parts of the hood together over the engine machinery.

801,209. Pneumatic-Tire Valve. Littleton K. Buck, Freehold, N. J. Filed December 12, 1904. Serial No. 236,473.

Claim.—1. In a pneumatic valve, a counterbored valve-tube, inclosing an operative valve mechanism, and provided with an integral flange at its lower end to impinge upon the exterior surface of the tire or other object to be inflated, in combination with an integral button-headed tubular securing-stud adapted to be, by suitable appliances, entered directly through the tire or other object to be inflated, and firmly secured in the reduced bore of the flanged lower end of the valve-tube, and with its button-head to firmly impinge the interior surface of the tire or other object to be inflated.

801,323. Reversing-Gear for Motor-Driven Vehicles. Hubert A. Kiser and Christian P. Anders, Westover, S. D. Filed September 12, 1904. Serial No. 224,122.

Claim.—1. The combination with the traction-wheel of a motor-driven vehicle, of a driving-shaft; a driving gear-wheel fast thereon; a ratchet-wheel loose on the shaft an internal gear carried by said wheel; a pinion fast on the traction-wheel; a rotary gear-carrier loose on the shaft an intermediate pinion carried by said carrier in mesh with the driving gear-wheel and the internal gear of the ratchet-wheel; means for both locking said carrier against movement in one direction; and against relative movement on the ratchet-wheel in the other direction.

801,334. Wheel. Petr Parik, Mistek, Austria-Hungary, Assignor of two-thirds to Antonin Parik and Jan Geisler, Moravska, Ostrava, Autsria-Hungary. Filed December 20, 1904. Serial No. 237,699.

Claim.—1. In a spoke-wheel the combination of spokes having wedge-shaped inner ends and tenons formed on their outer ends, of a center nave having two flanges thereon between which the inner ends of the spokes fit, a wheel-ring having outwardly-extending flanges, said ring having openings therein adapted to receive the tenons on the outer ends of the spokes, filling-pieces fitting between the flanges of the wheel-ring and between the said tenons, cape covering the tenons and holding the filling-pieces in position and a tire fitting over the caps and filling-pieces, substantially as described.

801,355. Self-Propelled Vehicle and Meth-

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals. 25 cents per line.

SPARK COILS, $4. Differential Gears, $9. 1-2 x 1 inch roller chain 50 cts. per foot. Lowest prices on lamps and tires. Send for bargain sheet. DETROIT CYCLE & MOTOR CO., Detroit, Mich.

A TEN PASSENGER wagonette; sample car, 1905-1906 model; steam; price and description on application. THOMPSON AUTO CO., Olneyville Sq., Providence, R. I.

FOR SALE—40 horse power, 1905 up-to-date Thomas Flyer. Used for demonstrating purposes. Very best condition. A bargain. C. A. COEY & CO., 1323-1325 Michigan Ave, Chicago.

WE will build an Automobile Garage at 105th St. and Columbus Ave. on 2½ city lots and lease same for a term of years to desirable party. For further particulars inquire of SOBEL & KEAN CO., 109th St. and Manhattan Ave., New York.

FOR SALE—One 16 h. p. "Rambler" $600.00; one 12 h. p. "Ford" $400.00. Both 1904 Models and in A1 condition. Address F. T. EVANS, Connellsville, Pa.

ON SALE, for account of customers ordering 1906 models—Two 4-cylinder Locomobiles, guaranteed by us. A good chance to secure a standard car at a reasonable figure. THE LOCOMOBILE COMPANY OF AMERICA, Broadway cor. 76th Street, New York.

ON SALE, for account of customer ordering 1906 model, one four-cylinder Locomobile, guaranteed by us. A good chance to secure a standard car at a reasonable figure. THE LOCOMOBILE COMPANY OF AMERICA, Broadway, corner 76th Street, New York.

FOR SALE—1904 Winton touring-car, $750; 1904 Franklin with detachable tonneau, $750; Both cars in perfect condition. A. W. GRANGER, Grand Hotel, Cincinnati.

I HAVE FOR SALE one Olds runabout; one four-cylinder, 20 H. P. gasoline car; eight steam cars, including runabouts and touring cars, also steam delivery wagons, all in first-class running order. Write for particulars, if interested. K. A. GROUT, Orange, Mass

FOR SALE OR EXCHANGE—Steam racing car, 40 horsepower; 36-inch wheels in perfect condition; speed, mile in less than a minute on straight away. He'd world's record for nine months, making a mile in 1:00 on mile track. Can use small car. JOHN HOWARD, 109 N. Broad St., Trenton, N. J.

CHAUFFEUR—Experienced, reliable man, wishes position; best references. HOWELL, 309 West 50th Street, New York.

FOR SALE—1903 Winton, oil and gas lamps, side baskets; 1904 style crank shaft, in best condition; 1903 two cylinder Pope-Toledo, oil and gas lamps, in perfect running order; 1904 two cylinder, 10 horsepower Ford, with tonneau, used five months: 1904 Model H Rambler, with tonneau; 1904 Duryea, tiller steer; all in fine running order; make your best offer on any of them. EASTON AUTOMOBILE CO., Easton, Pa.

BETTER FINISHES?—That's what many automobile manufacturers desire or require and without egotism, I know I can supply it. Have had 25 years' experience with high-class carriages and wish to connect as foreman of painting department in automobile factory. Am competent to mix own colors and have executive ability. Best of references. G. F. M., care Motor World, New York.

1905—32-38 horsepower Royal Tourist car; first class condition; equipped with Sprague top, glass front, acetylene lamps, odometer, extra tire; owner to go abroad reason for selling; $2,600. GEORGE S LARRABEE, Syracuse, N. Y.

The Persuasive Instrument!

¶ The average person who drives a motor car has a desire to speed—to "let 'er out."

¶ But we have yet to find the man who has an insane desire to get within the clutches of the law.

¶ *The Jones Speedometer* has that peculiar influence over the speeding motorist—if he is beyond the limit—there is that "arrow"—a constant reminder. It persuades him to go slower. Thus it accomplishes a great service.

¶ And to each user of The Jones Speedometer we present our brass Protection Tag which warns the officer of the law, not to arrest on guess work.

od of Controlling the Same. Ernst J. Berg, Schenectady, N. Y., Assignor to General Electric Company, a Corporation of New York. Filed April 20, 1904. Serial No. 204,052.

Claim.—1. The method of controlling over wide ranges the speed of a self-propelled vehicle deriving its motive power from an electric geenrator driven by a prime mover, which consists in varying over wide ranges the speed of the prime mover.

801,359. Pneumatic Tire. Henry W. C. B. Cave, London, England. Filed October 1, 1904. Serial No. 226,876.

Claim.—1. A pneumatic-tire cover composed of strips that are so interlaced with one another as to lie obliquely with respect to the periphery of said cover; and that have their breadths so increased at intervals dependent to the transverse section of said cover, as, when the cover is in position on the tire to cause the said strips to form at their crossings a close mesh.

801,390. Hydrocarbon-Motor. Abbot A. Low, Horseshoe, N. Y. Filed December 2. 1904. Serial No. 235,138.

Claim.—1. In combination with the combustion-chamber of a hydrocarbon-motor, a mixing-chamber of elongated form provided with a vertical extension at each extremity, a horizontal screen in each of said vertical extensions, means for injecting alcohol against the screen in one vertical extension and means for injecting ekrosene against the screen in the other extension, and an induction-valve interposed between said mixing-chamber and the said combustion-chamber, for the purpose and substantially in the manner set forth.

801,425. Vehicle-Wheel. Robert Weideman, Hawkeye, Iowa. Filed, January 21, 1905. Serial No. 242,175.

Claim.—A wheel of the class described, the same comprising a springy felly and spokes secured thereto, a hub having radial sockets for the inner ends of the spokes to slide in, and springs secured to the spokes and to the hub to resist the inward sliding of the spokes, and springs engaging the spokes and the felly intermediate the spokes.

801,452. Sparking Device. Benjamin G. Gilbough, Chicago, Ill. Filed December 30, 1904. Serial No. 238,927.

Claim.—1. The combination with an engine-cylinder of an ignition device connected therewith, comprising a fluid-actuated rotary wheel, an electrode actuated by said wheel, a coaching electrode, an electric circuit completed through said electrodes, and means for making the external portion of the circuit at proper intervals, for the purpose set forth.

801,481. Canopy-Frame for Automobiles. Lewis C. Shipley, New York, N. Y. Filed January 18, 1905. Serial No. 241,587.

Claim.—1. In an automobile-canopy frame, a dashboard, frames pivoted to said dashboard, a pane of glass between said frames, said frames adapted to support the said glass, and between which said glass may slide, the said frames being pivoted so that when folded one will lie over the other, a board extending across the upper ends of the frame, and catches adapted to secure the frames of the board together.

801,517. Speed-Reduction and Driving Gear. Joseph S. Fairfax, London, England. Filed May 11, 1904. Serial No. 207,434.

Claim.- 1. A speed-reduction and driving gear combining a cover, having a bearing, with a shaft revoluble in and projecting from said bearing; a sun-wheel secured to the shaft in close proximity to the bearing; a wheel having internal teeth secured to said cover so as to surround and be concentric with said sun-wheel; a planet system of wheels rotatable on pins and revoluble between the said sun and stationary wheels; a disk carrying the said pins and having a hub rotatable upon the outer end of the shaft, and a power-transmitting member formed on or secured to the said hub, substantially as and for the purpose hereinbefore described and shown in the drawings.

801,521. Running-Gear for Automobiles. Jackson O. Haas, Pottsville, Pa. Filed October 21, 1904. Serial No. 229,481.

Claim.—1. In a device of the class described, a frame structure including longitudinal side bars of Z-iron and cross-bars connecting the same; two of said cross-bars, disposed at and near the rear ends of the structure, being extended beyond the side bars of the latter; in combination with springs connected with the extended ends of said cross-bars, and a rear axle supporting said springs.

801,539. Carbureting Apparatus and Feed Therefor for Internal-Combustion Engines. Joseph S. Moreland, Rochester, N. Y., Assignor of One-Half to Moss Mosely, Rochester, N. Y. Filed April 21, 1904. Serial No. 204,222.

Claim.—1. In an explosive-engine, a carbureter comprising a supply-tube for supplying combustible fluid under suction, and controllable means for admitting air under pressure to said supply-tube for forcibly spraying combustible fluid therefrom, substantially as described.

801,580. Attaching-Collar for Pneumatic Tires. Jules C. N. Fouilloy, Paris, France. Filed February 20, 1905. Serial No. 246,588.

Claim.—1. The attaching-collar for non-splitting protecting devices of pneumatic tires of any not-cemented systems, comprising a leather piece having in its center an opening corresponding to the spoke of the wheel, such leather piece being strengthened by a metallic part, and carrying hooks with spring-fastenings, intended for holding the attaching-rings of the non-slipping protecting device, substantially as above described.

801,605. Speed-Indicating and Alarm Device for Vehicles. John E. Parrish and Richard H. Smith, Springfield, Mass. Filed October 31, 1904. Serial No. 230,830.

Claim.—1. In a speed-indicating device, the combination with a casing, having a centrifugal governor, therein, provided with a hollow, upwardly-open, spindle, and having at its top a supplemental indicator-casing having a slot through the wall thereof, and which casing is also constructed for the reception of interchangeable cards, of a stem within the hollow spindle, subject to vertical movement on the operation of the governor, and having its upper end located in the indicator-casing and having a part movable closely to, and registering on, the indicator, and means connected with the governor for imparting its rotation thereto.

801,606. Carbureted-Air Machine. Firmin Picard, Montreal, Canada. Filed December 3, 1904. Serial No. 235,327.

Claim.—1. A carbureted-air machine comprising a casing, separated rotatable supports mounted within the casing and each having projections extending toward the companion support, a strip of fabric mounted upon each of the sets of projections, and a blast-conduit situated between the supports and opening within both of the strips.

801,632. Vehicle-Wheel. Thomas Appleton, New York, N. Y. Filed January 25, 1905. Serial No. 242,587.

Claim.—1. In vehicle-wheels, a rim, a solid-rubber tire secured to rim, having transverse slots therein extending through from side to side, metal braces at the sides of the tire, and pins secured to the said braces and passed through the said slots, normally engaging their outer end walls.

801,645. Internal-Combustion Engine. Almon B. Calkins, Belleville, N. J. Filed October 24, 1904. Serial No. 229,707.

Claim.1. In an internal-combustion engine, the combination with stationary pistons arranged axially in line with each other, and means supporting their inner ends, of reciprocating cylinders surrounding said pistons, means connecting the cylinders together, a crank-shaft, and means connecting said cylinders in driving relation with said crank-shaft.

801,674. Change-Gearing. Joseph S. Moreland, Rochester, N. Y., Assignor of One-Half to Moss Mosely, Rochester, N. Y. Filed May 10, 1904. Serial No. 207,266.

Claim.—1. In a change-gearing, the combination of a main shaft, a secondary shaft, means constructed to drive said secondary shaft by said main shaft, gears mounted on said shafts, means for securing said gears to their respective shafts, means for shifting said gears into and out of mesh, and a common operating means constructed to actuate said gear-securing and gear-shifting means, substantially as described.

801,712. Gearing. George P. Dorris, St. Louis, Mo. Filed October 12, 1904. Serial No. 228,238.

Claim.—1. The combination with a cylinder of a motor-vehicle vapor-engine having an extension, the engine crank-shaft mounted therein, a clutch and transmission-gearing associated with said crank-shaft and clutch, of a housing attached to said engine extension and serving in its association therewith to incase said clutch, crank-shaft and transmission-gearing, substantially as set forth.

801,720. Inflation-Valve. John E. Keller, Jr., Litchfield, Conn. Filed July 16, 1904. Serial No. 216,857.

Claim.—1. An inflation-valve including an externally-screw-threaded tubular stem for insertion through a rim and provided with an external longitudinal flat portion, valve mechanism within the stem, a nut fitted upon the stem for engagement with the rim, locking-washers embracing the stem at opposite sides of the nut and provided with flattened portions engaging the flat portion of the stem to prevent rotation of the washers, and a dust-cap fitted to the outer end of the stem and engaging the outer washer to prevent looseness thereof.

801, 726. Coil Friction-Clutch. William H. Lindsay and R. Haden Couper, Johnstone, Scotland. Filed August 26, 1904. Serial No. 222,322.

Claim.—1. In a friction-clutch, the combination with shafting, of a pair of clutch members carried thereby, one of said members comprising a coil composed of a plurality of convolutions encircling said other member and having its central convolutions of a greater bore than the end convolutions, and means for throwing said clutch members into clutch.

801,727. Coil Friction-Clutch. William H. Lindsay and Haden R. Couper, Johnstone.

Digitized by Google

Scotland. Filed August 26, 1904. Serial No. 222,323.

Claim.—1. In a friction-clutch, the combination with shafting, of a rotary support loosely mounted thereon, a clutch member keyed to said shafting adjacent said rotary support, a second clutch member comprising a coil encircling said first clutch member and having

801,728. Coil Friction-Clutch. William H. Lindsay, Johnstone, Scotland. Filed August 26, 1904. Serial No. 222,324.

Claim.—1. In a friction-clutch, the combination with shafting, of a friction-drum carried thereby, a coil member, comprising a plurality of convolutions, operatively connected at one end to said shafting and loosely encircling said drum, and means for exerting a positive local winding pressure successively on separate convolutions of said coil member at distant points longitudinally thereof.

801,804. Axle-End. Hiram P. Maxim, Pittsburg, Pa., and Herbert W. Alden, Hartford, Conn., Assignors to The Electric Vehicle Company, Jersey City, N. J., a Corporation of New Jersey. Filed January 15, 1902. Serial No. 89,828.

Claim.—1. As an article of manufacture, an axle-end comprising in one integral piece a substantially vertical body portion, stub-axle-supporting jaws projecting from one side of the body portion and an axle attachment and an upwardly and inwardly extending load or strain supporting tang projecting from the opposite side of the body portion, substantially as shown and described.

801,823. Automobile. Ernst J. Berg, Schenectady, N. Y., Assignor to General Electric Company, a Corporation of New York. Original Application Filed April 20, 1904. Serial No. 204,052. Divided and this Application Filed May 22, 1905. Serial No. 261,498.

Claim.—1. In combination, an internal-combustion engine an electric generator driven thereby, an electrical ignition device for the engine, and means for connecting said ignition device to points on the generator-commutator having a difference of potention equal to only a fraction of the terminal voltage of the generator.

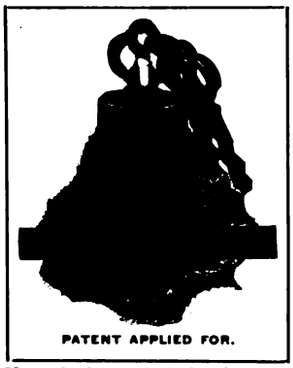
Parts for 1906 Automobiles:

For the convenience and assistance of automobile builders we have prepared complete drawings of our 1906 model pressed steel frames and frame members, and other parts, which will be mailed upon application. We are prepared to build pressed steel frames, change gears, front and rear axles and other parts in any quantity for early delivery.

STEEL STAMPINGS:

We make a specialty of steel stampings of all descriptions, including hubs, parts, brake drums, etc.

STEERING WHEELS:



Another specialty of ours—we make the best steering wheel rim on the market, and a large variety of spiders for application to any steering column.

PATENT APPLIED FOR.

The Hill Lock Valve

(here shown), is a new device and a good one. It is connected at any convenient place in the gasolene pipe and when locked and the key withdrawn prevents the gasolene from flowing to the carburettor and consequently the engine cannot be started. The key cannot be taken from the lock until the gasolene supply is entirely shut off—when shut off keep the key in your pocket. Impossible for anyone to steal your car. Your fuel supply is **locked,** but your car can be pushed to the wash-stand for cleaning, or into the street in case of fire. It is a small device made entirely of brass and turned with a "special key"—no two keys are alike. The lock is of the finest grade, it has five tumblers and cannot be picked or opened without the "right" key. Three keys are furnished with each lock. The locks are perfectly tight, being tested by gasolene under a pressure of one hundred pounds. It is made for all sizes of pipe from the smallest motor-cycle or launch to the most powerful touring car. Price, $5.00. **Special price to Supply Houses and Automobile Manufacturers.** Apply to your supplyman or garage. If not found in stock, address

E HILL, Jr.,

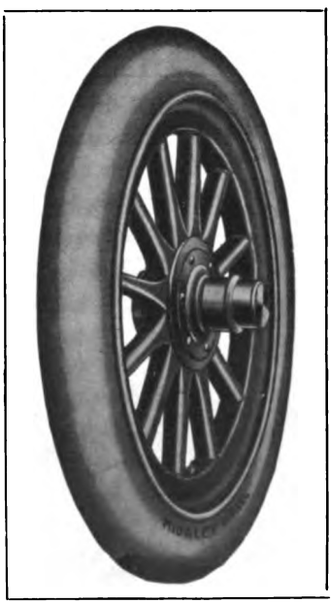
Norwalk Iron Works Co., SOUTH NORWALK, CONN.

The absolute best in Motor Lamps

THIS

SOLAR PARABOLENS HEADLIGHT

throws most powerfnl beam of any lamp made, yet burns cool. Simple, safe and sure, no better lamp can be built. The most your dealer will say about the next best is that it is "just as good as a SOLAR"—but why not buy the **standard** and dodge the second best.



We stand back of every SOLAR lamp with a guarantee to **you**—a warranty that leaves no room for risk on the buyer's part. You can't buy better lamps—whether oil or acetylene.

Write for booklet—or ask your supply man.

There are reasons why

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

Reason 3

AMALGAMATION OF FABRIC AND COVER.

¶ The difficulty arising from the separation of fabric layers and rubber cover is chiefly attributable to either a soft, easily-chipped cover stock, which permits dirt and pebbles to get under it, or to inadequate vulcanization.
¶ MORGAN & WRIGHT tires are made on the theory that the only satisfactory way to remedy this is in the making of the tire.

☞ By a series of exhaustive tests we have proven that it is impossible to so thoroly amalgamate these parts as to make separation practically impossible; and every Morgan & Wright tire MUST STAND THE TEST before it leaves the factory.

¶ This is demanded quite as much for our protection as for yours. It is one of the essential requirements in the making of a thoroly good tire.

MORGAN & WRIGHT, Chicago.

TALKIN' OF THE COST OF UP-KEEP

The Royal Tourist cars are run by their owners at less repair expense than any other motor cars built. You simply do not have repairs. Ask an owner of a Royal how much it costs him to maintain it. Then compare his figures with any other car, big or little, touring car or runabout. Royal owners everywhere. Ask one.

Why is this? Every part is made and put together with proper care. Money is freely spent for best materials. That's why!

That is also the reason why we were able to roll our car over in the Vanderbilt Trials and then finish among the first.

HAYNES

Here's a Record for You!

A 1906—4 cylinder—HAYNES, stock Touring Car, stripped, with a racing seat on it, proved it's utility by it's remarkable performance in the elimination trials for the Vanderbilt cup.

Especially constructed racing monsters were completely outdistanced by the HAYNES.

But one stop was made during the entire race, and this through no defect in the mechanism of the machine.

Isn't this a wonderful record?

Isn't this pretty good evidence in support of our claims?

And—better still, isn't the HAYNES a good car to sell because of this evidence of endurance, speed and simplicity.

Agencies are now being contracted. Send in your application at once.

Orders for exact duplicates of this car are being booked in the order of their receipt, Write at once.

THOMAS

1906

In spite of the fact that we are completing the finest fire-proof factory in the world, with a capacity of one thousand high powered automobiles per annum, it looks very much as though last year's scramble for Thomas Cars was going to be repeated.

Last year, premiums of all the way from $150 to $750 were refused for Thomas cars. We were likewise compelled to refuse orders for 50% of our capacity.

The only sales we lost were those of a few unposted persons here and there, who couldn't see how so much value could be sold at so reasonable a price.

That idea was demolished last season, and the fact that the 1906 Thomas is far costlier than the 1905 model without a change in price makes it unquestionably the greatest automobile value in the world to-day.

In brief, what you have to consider is a car which demonstrated last year its superiority to cars costing from $1,500 to $4,000 more money.

A car with 50 H. P. (actual), which is quieter than it was last year; smoother than it was last year; has larger motors; is far more beautiful; far more comfortable, seating five or eight, all fronting forward; with perfect clutch; perfect control; four-speed Hess-Bright ball bearing transmission; four powerful brakes; forgings throughout; material guaranteed to be the costliest made; fifteen Hess-Bright bearings and one roller.

Analysing this 1906 offering of power, beauty and the highest degree of construction, and bearing in mind what I have said to you about the probability of a greater demand than we can supply even with our increased capacity of 1,000 high powered automobiles per annum —do you not think it advisable for you to investigate the Thomas without delay by consulting our nearest representative?

WHY

PREMIER CARS

Appeal to All Classes.

TO THE PROFESSIONAL MAN—Because of its simplicity.

TO THE BUSINESS MAN—Because of its readiness to go at all times.

TO THE REPAIR MAN—Because of its perfect accessibility to working parts.

TO ALL MEN—Because of its low cost of fuel and maintenance.

We have much data from drivers on this latter point; for instance, one writes us: "The total cost of my running this season—5000 recorded miles—is only a trifle over one cent per mile for the car—or 1-5th to 1-4 cent per mile per passenger—total for repairs, fuel, etc., excepting tires."

These are points to remember when purchasing a car.

"The air cooled season never ends."

Side Entrance Model - $1500 Runabout - $1250

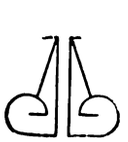
Congratulations

from a dealer in a rough-road country on the service obtained from

GOODRICH TIRES



WITH THE BAILEY TREAD.

"We wish to congratulate you because of the splendid way your Goodrich-Bailey tires have given satisfaction and service to us and our customers. They not only wear longest with the least show of use, but seem to be free from weak spots, such as fabric breaks and rubber and fabric parting company on the Tread, the latter seems to be a sure thing on some tires that we know of.

We are looking to 1906 Goodrich and expect to be partial to them, because we believe they deserve it if their previous reputation is any criterion to go by."

—*Asheville Cycle and Auto Co.*, Sept. 23, 1905.

THE BAILEY "WON'T SLIP TIRE." Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyright mark have been ispected and pronounced perfect. We guarantee our tires only on rims so branded.

Motor Car Tires

THE MOST SERVICEABLE TIRES MADE

No Internal Heating

The thread fabric construction makes the tire so pliable that it changes position in service with the least possible resistance, which means that the tires are very resilient, fast, and free from internal heating.

No Pinched Tubes

The tire is fitted with a flap, which prevents the tube from coming in contact with the rim, or from getting under the edges of the case, preventing pinched tubes.

No Creeping

The flap forms a strong frictional contact with the edges of the clinches, holding the edges firmly to the rim for its entire circumference, so that it is impossible for the tire to creep.

THE STANDARD AMERICAN COOLER.

THE WHITLOCK COOLER

was used on the

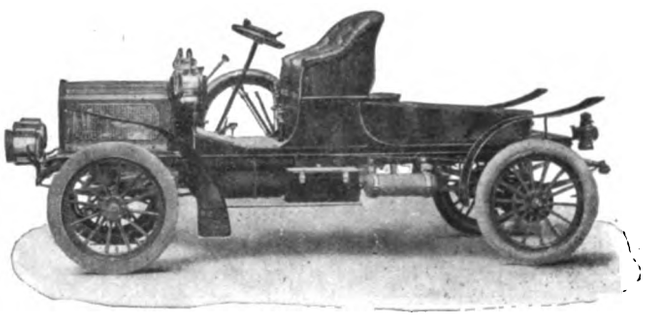
LOCOMOBILE RACER that finished THIRD in the VANDERBILT CUP RACE.

It was never touched during the race. It did its full duty.
It held its water and kept the engine cool.

THE ONLY CELLULAR COOLERS MADE IN AMERICA

that were used in the 1905 and 1906 Vanderbilt Cup Races, also the 1906 Gordon Bennett Race.
Quality and efficiency only figure in an event of this importance.
We make coolers of the HIGHEST EFFICIENCY.
The leading makers of automobiles have recognized this fact by adopting

THE WHITLOCK COOLERS,



continuously for the seasons of 1903, 1904, 1905, 1906.

THE WHITLOCK COIL PIPE CO.,
Hartford, Conn.

The Incomparable

WHITE

The Car for Service.

THE WHITE RUNABOUT

If seating capacity for two is sufficient for your needs, you would do well to inspect critically the White runabout—our regular chassis fitted with runabout body. It, of course, possesses all those qualities of simplicity, durability and reliability which have made the White the favorite touring car of this country. In addition, is the increased speed which results from the lessened weight. The price, furthermore, is less than that of our touring car. The White runabout should certainly appeal strongly to those who wish a stylish, speedy and silent car.

Write for further details regarding price, weight, etc.

Mr. C. E. Miller,
#96 Reade Str.,
New York.

Dear Sir:-

I wish to write you regarding the Brampton chains which I purchased for my Franklin car.

No. 1 I have used all the time and have given it about as hard a pull as it is possible for a chain to receive. All over the mountains of Orange County, New York, and between New York, Philadelphia and Lakewood until I am tired of the road.

The long chain on the Franklin is a pretty stiff proposition and many, in fact, most of my friends state that their first trouble on that car is that chain breaks and I have met people who have worked for hours to get their chain fixed on the road, but I have never met a Brampton in trouble and mine so far has not a scratch on it.

No. 2 is in the paper in which your salesman wrapped it for me, and is resting in the bottom of the car waiting for No. 1 to break.

My partner, Mr. Wilmarth, President of the L. I. Automobile Club, has a Brampton on his Winton and has had practically the same result as myself. He got me in line for the Brampton and there I stay.

Very truly yours,

Dict.

Change Tires 30 Seconds Goodyear Universal Rim

SUPPOSING you were 25 miles from home, and your tire exploded. And you hadn't another with you. And when you stopped at the garage, the man said: "I'm sorry, but I haven't a single tire of that make."

Wouldn't it make you mad?

Of course it would, if you had an *ordinary* rim.

But if you had a Goodyear Universal Rim, you would smile and say: "Bring on any old tire, as long as it's a clincher, my rim will take it." And in less than three minutes you would be enjoying the scenery once more.

Because it *isn't* an all day job to take off and put on a tire when your car has Goodyear Universal Rims. Just jack up the wheel and in 30 seconds the old tire is off, and in another 30 seconds the new tire, ANY kind, is on. You need no tools but the hands. And are "fixed up" and on the road while the man with *ordinary* rims is hunting for his crowbars and levers.

Figure 1.

You see the flange comes right off on Goodyear Universal Rims like Fig. 1.

And then a 26-inch tire (for example) slides right on to the 26-inch rim like Fig. 2, as easy as you would put on your hat. On an ordinary rim, you would have to pry that 26-inch tire over a 27-inch flange. You know what a profanity inspiring job that is, and it doesn't do the tire any good either.

Figure 2.

Now this is all there is to taking off and putting on a tire when you have Goodyear Universal Rims. See how simple and easy it is.

The rim is made up of four parts, like Fig. 3.

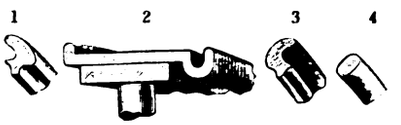

Figure 3.

Nos. 1 and 3 are the removable flanges (rings) which can be adjusted to any clincher tire.

No. 2 is the base of the rim attached to the felloe of the wheel. It can be used without fitting on any standard wheel built for standard clincher rims.

No. 4 is the binding ring which holds the flanges in place.

Figure 4.

If you have decided to relieve yourself of all tire troubles and in consequence ride Goodyear Detachable Auto Tires, a section of the rim when put together, would be like Fig. 4.

Or, if you ride an ordinary clincher tire, the rim section would look like Fig. 5.

Figure 5.

The ring which holds the flanges in place is split at a point alongside the valve stem, like Fig. 6.

It can't be removed (and, of course, the tire can't come off) while the flange presses against it. This flange is kept tight against the ring by a plate which slips over the valve stem like Fig. 7.

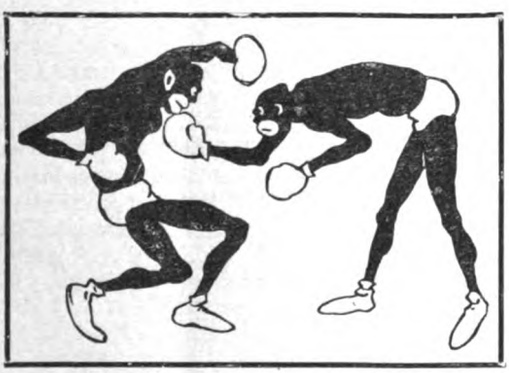
Figure 6.

When you wish to remove the tire, loosen the nut which holds the valve stem down, and push the stem up through the rim. This pushes up the plate and lets the flange ring slide inward like Fig. 8.

Figure 7.

Then lift out the binding-ring, slip off the flange, and pull off the tire. Time, 15 seconds. No tools but the hands.

Figure 8.



Those who are weary of tire troubles are specifying Goodyear Auto Tires on Universal Rims. This equipment *costs no more* than the ordinary kind, and multiplies the pleasures of motoring many times.

Ask for our "Good News Book" and find out all the good points of the Goodyear Auto Tire and Universal Rim. It's of vital interest to the Manufacturer, Dealer or User who is satisfied with nothing but *the best*.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, October 26, 1905. No 5

RECEIVER FOR DE DIETRICH

Affairs of American Branch Are Much Involved —Ownership of 11 Cars in Dispute.

The De Dietrich American branch is the first of the concerns handling imported cars to fall on evil times. It is now in the hands of a receiver, Lindsay Russell, his appointment following the filing of petition in bankruptcy by Baron Adrian De Turckheim, the Garvin Machine Co. and the National Surety Co. The petition alleged that the corporation was involved and had transferred property to creditors whose names were unknown to the petitioners. The liabilities are estimated at $8,000 and the assets at the same figure.

The receivership proceedings are said to be an effort to untangle the ownership of 11 cars now at the De Deitrich branch, 215 West Forty-eighth street, New York. These cars were transferred by bill of sale on May 29 to the branch by Frederick De Turckheim, as owner, after performing this service and also personally assuming a De Deitrich debt, Frederick, who had been head of the De Deitrich interests here, drew his balance from the banks, so it is alleged, and, without heralding the fact from the housetops, took passage for Europe. Some two weeks since, Mr. Russell was appointed receiver of his affairs. Then up spake his brother, the Baron, who claims to be the rightful owner of some of the transferred cars. The receiver is expected to discover "who's who."

The De Dietrich interests first established themselves here in pretentious quarters directly facing the Waldorf-Astoria and later opened a branch in Boston. Afterward they removed to Forty-eighth street and about two months since closed the Boston establishment.

Cadillac o Build on Broadway.

The Cadillac Automobile Co., of New York, also is to leave the congested automobile "colony" and seek the broader portion of Broadway on the other side of Columbus Circle. The fact was made known this week, when Walter C. Martin, president of the company, let the contract for the erection of a fine fireproof building on the corner of Broadway and Sixty-second street, fifty-two feet on the former thoroughfare and seventy-two feet on the latter. It will comprise four stories and basement and will incorporate every modern convenience, including steel elevators. It is expected to be ready for occupancy about February 1 next.

Manufacturer Stearns Seriously Injured.

Frank B. Stearns, president of the F. B. Stearns Co., of Cleveland, Ohio, lies at his home, No. 2,198 Euclid avenue, that city, in a serious condition as the result of a collision with a farm wagon near Willoughby on Wednesday morning of last week. Mr. Stearns and J. G. Sterling, the company's chief mechanic, started from Cleveland Tuesday at midnight for Buffalo, N. Y. Near Willoughby there is a sharp turn in the road, and it was there that the collision occurred. Stearns was thrown out and his spine injured. Dr. L. B. Truslee, who is in attendance, states that although the manufacturer has an excellent chance to pull through, he will be bedridden for two months or more.

Chicago Royal in Trouble.

Involuntary bankruptcy proceedings have been begun against the Royal Automobile Co., 144 Green street, Chicago, Ill. William D. Rockwell, former manager of the company, Algernon R. Rockwell and the Excelsior Supply Co., are the petitioning creditors. Needless to add this Royal concern is in no way related to the well-known Royal Motor Car Co., of Cleveland.

No Receiver for Kaestner.

There will be no receiver appointed for the Charles Kaestner Mfg. Co., South Bend, Ind. The Kaestner people write that the application for one grew out of a disputed account and was made with a view of forcing them into a settlement. When the effort failed they say that the proceedings were discontinued.

Prestolite Interests Change Hands.

The Concentrated Acetylene Co., has been taken over by a new corporation, the Prestolite Company. The business will be continued in Indianapolis.

THE "CORPSE" IN THE CAFE

Or How Selden Sleuths Found a Man Moore Alive Than Dead and Turned a Laugh.

If ever he was dead, W. . Moore has come to life again. The reports of his death that were printed in very many papers some two months ago apparently were to his liking and must have caused him some quiet chuckles; at any rate, Moore did not take the trouble to deny them. It is even alleged that he so thoroughly enjoyed the distinction of being a dead one" that on the occasion of his periodical excursions to New York he masqueraded under an assumed name.

Moore is the wealthy young New Yorker given to money ignition against whom the sponsors for the Selden patent secured an injunction for violation of their rights in that he had purchased and used an unlicensed imported car. When the news of the injunction was made public, the agents for the car involved promptly gave out that Moore literally was a dead one—that he had become a cold, clammy corpse while visiting in Texas.

The idea of obtaining an injunction against a corpse was so rich that a great laugh went up and a deal of fun and derision, if not contempt, was leveled at the Association of Licensed Automobile Manufacturers. They did not join in the laugh, in fact, it "rubbed them the wrong way" and roused their "dander." They refused to believe that Moore was "beneath the Texas daisies."

Sleuths, minus gum shoes, were engaged and without a very extensive search of gravestones, they soon learned that the young man was very much Moore alive than dead. But there was something of the flea in his make up. He hopped about in lively fashion but it is officially announced that on Thursday night last in Albany, N. Y., the supposed corpse was uncovered and the Selden injunction thrust into his hand by a United States deputy marshal of the name W. C. Irving.

The announcement is very circumstantial. It gives the exact hour and place of ser-

Digitized by Google

vice. It was 10.40 p. m. by the clock and Moore at the time was in a place of the kind for which he is alleged to have a fondness—the thirst parlor of the Ten Eyck hotel. It is added that although "taken completely aback," he accepted the situation "with the best face possible." The sort of face a man who had been content to be considered a stiff corpse can present under such circumstances is not easily pictured. However that may be, the A. L. A. M. believe that it is now their turn to laugh.

In the Retail World.

M. B. Ring is building a garage on Chestnut street, Norwalk, Conn.

Horace Sague & Son will start in business on Church street, Poughkeepsie, N. Y., on January 1. They have taken the agency for a foreign car.

Eichorn & Black, who have conducted a garage at No. 5 Marshall street, Newark, N. J., this week moved into their new quarters at Nos. 9 and 11 Hill street.

Having observed the direction of the wind, the Antler Stables Co., of Toledo, Ohio., has changed its name to the Antler Stable & Garage Co. and doubled its capital stock, from $25,000 to $50,000.

W. W. Osborn has been elected president of the Zent Automobile Co., of Bellfontaine, Ohio, to succeed O. E. Yoder, who resigned. The Zent company is expecting to move to Graff or Lancaster, Ohio.

The Automobile Co., La Porte, Ind., through its president, William N. Rumel, has sold its plant at Michigan avenue and Washington street. W. N. Rumley and Charles N. W. Walsh are the purchasers.

The Quincy Automobile Co., of Quincy, Ill., which was recently organized to conduct a general garage business, is erecting a two story brick building on Fourth street. The White steam car will be exploited by the company.

Amandee V. Reyburn, Jr., has purchased a lot in Delmar avenue, St. Louis, Mo., 100x150 feet, upon which he will erect a two story brick garage to surpass any in the Missouri city. It will cost, approximately, $35,000.

The Southern Automobile Co., of Nashville, Tenn., has closed a deal whereby it acquires the spacious building on Broad street formerly used as an amusement hall. Extensive repairs will be made before the company moves into its new garage.

J. Arthur Ketchum will erect a $25,000 garage on the so-called Bockes lot, South Broadway, Saratoga Springs, N. Y. The building will be of brick and concrete construction, fireproof throughout, 100x150 feet in dimensions, and will have an entire plate glass front.

The H. T. Hearsey Vehicle Co., Indianapolis, Ind., expect to take possession of their new garage on the 1st inst. The building, which adjoins the Hearsey salesrooms, is 50 by 150 feet, is equipped with the most modern facilities and will be kept open night and day.

The Week's Incorporations.

Jackson, Mich.—E. C. Clark Motor Co., under Michigan laws, with $15,000 capital. Corporators not named.

Augusta, Me.—Diezeman Shock Absorber Co., under Maine laws, with $200,000 capital. President and treasurer, I. L. Fairbanks.

New York City, N. Y.—Hutchinson Electric Horn Co., under New York laws, with $20,000 capital; to make electric horns for automobiles and to make horseless vehicles. Corporators—Paul M. Pierson, Miller Reese Hutchinson and William M. Williams.

Detroit, Mich.—The Maxwell-Briscoe-McLeod Co., under Michigan laws, with $10,000 capital; to make automobiles. Corporators—Alexander I. McLeod, Benjamin Briscoe, James Danaher, E. J. Corbett, Frank Filer, James E. Danaher and George F. Monaghan.

Detroit, Mich.—Motorcar Co., under Michigan laws, with $150,000 capital; to make friction driven automobiles. Corporators and officers—Frank Caughey, president; Fred. Postas, first vice-president; Byron J. Carter, second vice-president; Randall A. Palmer, secretary; Henry A. Radford, treasurer.

Disputing Dealers Go to Law.

Differences of opinion concerning the management of the business of a Sacramento (Cal.) firm have led the three members into the courts for settlement. W. C. Wing has brought suit against his partners, L. E. Moeller and J. G. Patterson, for an accounting and has applied for a receiver.

Wing alleges that the firm was formed with the understanding that it should continue until the partners should disagree. The defendant, Patterson, he affirms, was taken into partnership in June, 1905, and it was understood that the three were to share alike in the profits and losses. Wing affirms that he invested $3,250 and that Patterson put up $2,000, while Moeller contributed his experience. It is complained that Moeller failed to abide by the terms of the agreement; that he failed to account to his partners for money received and collected, and that he used the property of the concern for his own pleasure and benefit without recompense to the company.

Co-operative Garage in Texas.

Down at Fort Worth, in the Lone Star State, a co-operative club and garage will soon be incorporated by automobile owners in that city. As yet no name has been selected for the club-garage, but these officers were chosen: President, M. R. Sanguinet; vice-president, A. B. Wharton; secretary, C. D. Reimers; treasurer, F. R. Hedrick.

JUDGE REVERSES HIMSELF

Wgs in a Hurry to Leave Town and as a Result Winton Gets a Retrial.

Supreme Court Justice Keogh in a memorandum handed down last week reversed himself in the suit of Daniel R. Chichester against the Winton Motor Carriage Co. and the latter will now have an opportunity to again present their case to the New York tribunal.

This suit involved the ownership of three automobiles and it came on for trial before Justice Keogh on March 27, the jury returning a verdict for the plaintiff. On the ground that neither the justice nor the jury were present when the verdict was opened and read, although it is claimed counsel for both sides had agreed to their absence, Charles Thaddeus Terry, of 167 Broadway, New York City, moved that the verdict be set aside and a new trial granted.

The suit in itself is an interesting one. Chichester, the plaintiff, entered into a contract with the Winton Motor Carriage Co., by which, in consideration of receiving three of the company's four-cylinder cars, he agreed to give said company $8,500 worth of advertising in newspapers, passenger cars and magazines. After $1,460 worth of advertising had been supplied by Chichester, the defendant company deposed "that the defendant being urged thereto by the plaintiff and having at that time not yet begun to distrust him, allowed plaintiff to take away and use or dispose of as he saw fit two of the said automobiles. When Chichester brought suit to get possession of the third machine which defendant declared plaintiff was not entitled to, inasmuch as he had not given the full quota of the agreed upon advertising and the machine was still in their garage.

The suit came up for trial before Justice Keogh and was completed Friday afternoon, March 27. Justice Keogh told the counsel on both sides that he was very anxious to take a train out of town and asked if they would agree to the sealed verdict to be opened by the clerk of the court without the presence of the justice and jury. It is said counsel agreed and on the following morning a sealed verdict for the plaintiff was opened by the clerk in the presence of the counsel and entered on the minutes of the court.

In his memorandum setting aside the verdict and granting a new trial, Justice Keogh says: "Defendant asks to set aside the verdict on the ground that, notwithstanding stipulation of counsel, the clerk had no power to receive and record the verdict in the absence of the presiding justice and jury. I am compelled by a decision of the Appellate Division in Morris vs. Harberger, 91, N. Y. Supp. 409, to grant this motion. I will sign an order putting the case at the head of the calendar for the first Monday in November."

Olds Interests in Boston Change Hands.

The Olds interests in Boston have been taken over by a new organization, the Adams-Sutton Motor Co., incorporated with a capital stock of $40,000.

The president and manager of the company is Walter O. Adams, the former general manager of the Crest Mfg. Co., of Cambridge, Mass., later assistant sales manager of the Ford Motor Co., of Detroit. In taking up the new connection he resigns his position with the Olds Motor Works, of Lansing, as their foreign agency director. David Sutton, the secretary-treasurer, comes from a responsible position with the Canadian Bridge Co., of Walkerville, Ont., returning to Boston, where he resided a number of years. The company will occupy spacious quarters in the new Motor Mart in Park Square, and will be ready to show the new Oldsmobile cars during the latter part of November. The exploitations of the Oldsmobile commercial cars will be given special attention, Mr. Adams having this department under his personal direction.

More Room for Marmons.

The Nordkye & Marmon Co., Indianapolis Ind., manufacturers of the Marmon car, have nearing completion an immense steel frame building to provide facilities for the increasing demands of its automobile department. This structure is 104x340 feet, and while designed for a foundry, is to be used at first exclusively for automobile work. It is of sawtooth roof, 62 feet high, and well lighted on all sides.

The principal business of the Nordyke & Marmon Co. is the manufacture of mill machinery, of which it is one of the largest in this country, but increasing attention is being paid to the construction of its Marmon car, which possesses a number of distinct and advanced features and the demand for which is in keeping with the times. The car is built complete in the company's factory, cylinders and engines being cast and ground in its shops. The upper part of the tonneau is made of aluminum in one piece, and is one of the largest single castings of aluminum made for any purpose.

Buchanan to Have a Factory.

The Lee & Porter Mfg. Co. has been incorporated at Dowagiac, Mich., with $200,000 capital, to manufacture automobiles, and, although the business office of the company will be at Dowagiac, a plant will be erected at Buchanan. The officers of the new concern are: President, S. E. Lee; vice-president, H. H. Porter; directors, the officers, J. S. McCleary, J. O. Beecraft and W. C. Porter.

Buick Files Million Dollar Certificate.

The Buick Motor Co., Flint, Mich., has doubled its capital—from $500,000 to $1,000,000. The necessary certificate has been filed with the Michigan authorities.

TO MAKE CHROME STEEL FRAMES

Parish to Re-enter the Trade with the Backing of Powerful Steel Interests.

What probably will be styled the N. E. Parish Mfg. Co. is now in process of organization. It is definitely known that Neff E. Parish, organizer and former head of the Parish & Bingham Co., of Cleveland, will be its general manager and that in all probability the company will take his name. Of even more significant interest is the fact that R. E. Jennings, president of the powerful Carpenter Steel Co., Reading, Pa., will be president also of the Parish Co.

Their immediate purpose is the manufacture automobile frames of the new pressed nickel chrome, oil tempered steel developed by the Carpenter Co., and which in other parts is so emphatically answering the trying demands of automobile use. This steel, it is asserted, affords a saving of almost one-half of the present weight, and increases the strength about three times over the frames now being used in even the very best cars. It is claimed that these frames can be produced in a manner so that they will show practically 200,000 lbs tensile strength per square inch as compared with 50,000 to 60,000 lbs. per square inch, which is being reached in steel now being used.

Mr. Parish is, of course, well-known to the trade and knows the business from the ground up. He will have as superintendent of the new company, Mr. Gartshore, former superintendent of the Parish & Bingham Co., and several other of his old associates. Mr. Jennings is such a commanding figure in the steel industry that his identification with the new concern will give it immediate and general recognition. It is probable that the frame plant will be located in close proximity to the Carpenter Steel Co.

One More in Detroit.

Detroit's numerous colony is to have still another addition—the American Electro-Mobile Co., in which Eastern capital is said to be involved. W. A. Woodrow, president of the Old Dominion Steamship Co., holds a similar position in the Electro-Mobile Co.; Frank P. Rae, formerly associated with Edison, is its engineer, and C. W. Beaumont is secretary-treasurer. The exact location of the plant has not yet been decided upon. The Electro-Mobile company asserts that its car will be operated with storage batteries which will enable it to run 125 miles without recharge.

Crawford Incseases His Capital.

To give a larger working fund, the capital stock of the Crawford Automobile Co., of Hagerstown, Md., has been increased from $50,000 to $100,000. With the fresh capital the company will erect a three story addition to its plant.

The Constructive Principle of Fisk Tires Involves

A Technique So Simple in Manipulation and So Positively Accident-Proof

that it should readily appeal to any discriminating purchaser.

Beads of a wedge shape are applied to a flat rim and held by rings which are rolled on an angle corresponding to that of the bead, so that when drawn down by clamping bolts, the bead acts as an inside cone wedge, with the result that the tire is firmly held to the rim, without air pressure or circumferential contraction.

A Tire so Locked to the Rim Incorporates a "Life Preserving Principle" and Reduces Tire Maintenance to an Economic Basis.

DEALERS

During 1905, we built and sold more than 4,000 Cadillac Cars. Not one purchaser of these cars is now willing to let his "bargain" go at less than the price he paid for it.

FOR 1906 THE NAME

CADILLAC

will possess more than ever before a magic meaning to live dealers.

There are hundreds of towns in the United States where Cadillac Cars have never been sold. We want an agent in each of these localities and if you are a good business man you will at once get in touch with us. No line was ever so attractive as ours will be for 1906.

Write us to-day

CADILLAC AUTOMOBILE CO., Detroit, Mich.

Member of the Association of Licensed Automobile Manufacturers.

THE MOTOR WORLD

Published Every Thursday by

THE MOTOR WORLD PUBLISHING COMPANY

154 Nassau Street,

NEW YORK, N. Y.

TELEPHONE, 2652 JOHN.

Subscription, Per Annum (Postage Paid) $2.00
Single Copies (Postage Paid) . . . 10 Cents
Foreign Subscription $4.00

Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to THE MOTOR WORLD PUBLISHING COMPANY.

General Agents: The American News Co., New York City, and its branches.

☞Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

☞Those who are interested in motor vehicles will find the facilities and information of our office always at their command.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, OCTOBER 26, 1905.

The Vote for Road Improvement.

In all the heat and flubdub preceding the election in New York which occurs on November 7, next, little or nothing is being said of the proposal that the State shall bond itself for $50,000,000, at the rate of $5,000,0000 for ten years, for the construction of improved highways. That proposal will, however, come up for the approval or rejection of the voters and no man who has to do with automobiles in any way, shape or form should permit it to escape his favorable action. It is difficult to see how any of them can do so.

The health and future of the automobile industry and the improvement of the common roads are so very intimately related that none who looks far beyond his nose and who is possessed of a spark of real interest will stop at voting for the much-desired amendment; he will go out of his way to urge all with whom he may come in contact to do likewise. It is the duty of all automobilists to do so—a duty that is made imperative in the case of those engaged in the trade. Those in authority should take sufficient interest in the matter to lend a hand in this direction. Every mile of improved road means the sale of more automobiles and the increased comfort and pleasure of those who use them.

New York State already has bonded itself for more than twice fifty millions for the improvement of the canals—an improvement of direct benefit to a comparatively few persons. The matter of road reform is one that comes straight home and is actually felt and shared by every man, woman and child personally.

The defeat of the amendment will be in the nature of a calamity—of a stay to progress.

Reducing the Shocks.

It would appear that some designers have come to the conclusion that the millennium, in the form of a perfected suspension, is not to be reached by working on and improving the present devices, nor, on the other hand, in discarding them altogether in favor of something entirely different, but in retaining the current system just as it is and adding a device here, another there and still others in various parts of the car until there is danger of the original suspension being lost sight of under its burden of auxiliary devices. Not that they are uncalled for—quite the reverse is the case—were the suspension of the car equal to the demands upon it as originally designed no need of adding to it would be felt. Much of the success of the many auxiliary spring devices is to be accounted for from this circumstance—their presence is a necessity on a large number of cars on the market.

Before the present recognized standards of power and speed were reached suspension was a matter of subordinate importance for more than one reason. In the first place, the designer was far too busy with the motive power of the cars to pay much attention to it, and second, with the low powers, and consequently low speeds then general, stock springs from manufacturers whose specialty was supplying the suspension needs of wagons and carriages sufficed. No shortcomings were apparent in the capacity of the suspension, for the load imposed upon it; its limit had not yet been reached or exceeded, and the springs accordingly showed no signs of weakness. Moreover, great reliance was placed on the springing effect of the tires, and between the two there was little fault to find with the result. But neither springs nor tire sizes have kept pace with increasing weight and power, so that in many instances a point has been reached where the load imposed on both has been excessive, whether standing or running. Hence something in the shape of an auxiliary made its need felt, and as the car was in the owner's hands by this time this had to take the form of something, not alone readily applicable without modifying the construction, but also reasonably low in price—a state of affairs that has made the marketing of several devices to fill this need an easy matter. That their advent upon the market was most opportune is patent from the widespread demand that has sprung up. Their success has been merited, and the favorable reception they have been accorded thus far will probably continue for some time to come—at least until something better appears, of which there is at present slight prospect on the horizon.

Refinements of Driving.

Driving has become more of a science in the last few years than was possible before the introduction of refinements that have come during that time. With the brake and clutch interconnected car that was also minus a throttle, there was nothing to do but release the clutch and apply the brake whenever it was necessary to slow up, regardless of the slight measure of retardation that might be desired, such as for rounding corners While there was no throttle as now understood, it was, of course, possible to switch off the current and so retard the speed, but this was more than likely to result in an explosion in the muffler, to the detriment of the latter as well as other parts of the exhaust piping when the motor was restarted with the spark. It, moreover, started the engine with a more or less severe jolt that was transmitted to every part of the mechanism.

But since the addition of a throttle similar in many respects to that common in steam practice, and which may be used in much the same manner, together with the discarding of the old method of interconnecting the clutch and pedal brake, a much better form of control is possible, which, when skilfully used, results in extremely smooth running, both on the level and downhill. This is commonly termed "braking with the engine," and simply consists in shutting off the fuel supply temporarily and permitting the compression to act as a retarding agent instead of the brake. It is a particularly efficacious

Digitized by Google

method of keeping the speed within bounds when descending hills without having to resort to the intermittent use of the pedal brake, which is destructive of tires, not to speak of the strain imposed upon other parts of the car. The spark may also be used to effect the same purpose, but it is still open to the objections that made its use inadvisable in earlier days. This method is not susceptible of variation, as is possible with the throttle; the spark is either on or off, it is all one or the other; there is no gradual opening up, which results in the engine picking up again smoothly instead of restarting its power strokes with a jerk.

Of course, there is more to it than simply shutting and opening the throttle; there is that indefinable something so aptly termed the "knack" or "hang of the thing" that must be mastered, and doubtless this in turn means something a little different in the case of each particular car; like locomotives, no two are exactly the same. Probably a little practice is the only essential required to acquire this, and the chief thing to be guarded against is too great a drop in the speed before reapplying the power. For instance, if in descending a hill this is not done until after the car has passed off the down grade and began to slow up on the other side, there will be more or less of a jerk, which will be directly proportionate to the difference between the speed of the car and that at which the engine is restarted. If, on the other hand, before the end of the grade is reached, and while the engine is still maintaining a good rate of speed, the throttle is opened gently, the cylinders will begin to fire at a rate somewhat slower, or at most only slightly in excess of that at which the engine is then turning, and the transition from coasting to running will be so gradual as to be scarcely noticeable. This method is naturally not intended to be used in bringing the car to a stop; in such cases the clutch should invariably be withdrawn, but it will be found conducive to smooth running on give and take roads, as well as in traffic and for rounding corners, while the effect of the enforced rest given the pedal brake will be noticeable on the life of the tires.

There has been a question raised as to the effect on the motor from long continued following of this practice, but a little consideration of the subject will make it apparent even to the veriest tyro that under such conditions the cylinders are not being subjected to the same strain that is present when they are firing. It is not the same thing as reversing a steam engine and opening the throttle while still at speed, a trick that occasionally results in the loss of a cylinder head. Nothing opposes the travel of the piston but the air in the cylinder, which proves a further benefit by scavenging it clear of all burned gases.

The Matter of Bodies.

To the casual observer, the manner in which history is constantly repeating itself in the matter of body design cannot but prove a matter of interest. Not simply are the older and more common forms of body which have served their purpose in the era of animal traction still used as they have been used ever since the horseless carriage came to be a factor of interest in the world, but, seemingly, they are growing more and more common as time goes on. Instead of the body builders of the day branching out into new and untried fields, they are sticking to the forms which have already proven their worth, and are confining their efforts toward advancement to the perfecting of details and the addition of new and luxurious comfort-giving devices to the types which are a fixture.

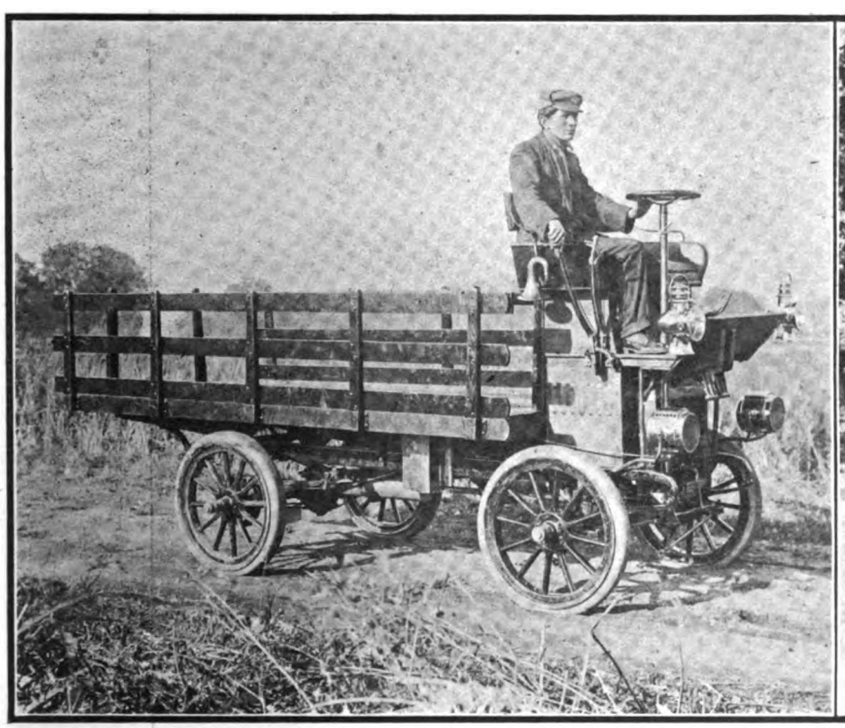
For instance, the tonneau body, which was decidedly an innovation in its way, is fast becoming extinct, while its place is being taken by the side entrance type, with its rear portion partaking somewhat of the tonneau shape, and still yclept "tonneau," but yet in reality having about it far more of the old time surrey than tonneau. So, too, it is with the closed cars. The true limousine, with its rear door and herdicklike appearance, is yielding its place to the brougham and landaulet, while the limousines, so-called, are more of the nature of extension broughams, with the extension behind instead of in front of the door, than the limousines as they were known a year or two ago.

In small car design the same thing is to be seen. The runabout still looks more or less like a buggy minus the horse; or else, in the newer form of touring runabout, its semblance is that of the large car, and the similarity to the surrey of old is even more noticeable than in its prototype. The detachable tonneau has departed—it was not quite to the purpose—and in its place has come the interchangeable body for the large car and the folding seat for the runabout. And this latter, which is to be something of an innovation with certain of the 1906 cars, which has always held its place in certain others and which seems likely always to remain, is nothing more than the old jump-seat buggy idea brought up to date.

To some this is a source of untold anguish. They want to forget the horse and all things which remind one of the horse. Others bow to the inevitable. It is not a matter for designers and engineers to decide, this question of body design, after all; it is to them to furnish the power plant and the chassis and the charm which makes them "go." But when it comes to the body milord the buyer knows what he wants, and milady his wife knows, too, what is required; and, after all, the engineer must give up his pet idea and stow away the old body, be it patterned after a tub or fashioned on the lines of a sea shell, and give the people what they want and what they have become accustomed to seeing.

Akin to a Resurrection Day.

What has become of the thousands of rear entrance cars of all kinds of shapes that were turned out previous to the year 1904? The question is one that is frequently asked, but seldom has it received a better answer than a sight of the practically endless line of cars that strung out from the Long Island Railroad ferry at Thirty-fourth street, New York, all the way to the grandstand at Mineola in an unbroken file before sun up on the morning of the Vanderbilt Cup race.



None but those who had watched the evolution of the car during the metamorphosis through which body design has passed in half a decade were competent to identify many of the archaic specimens that were believed to have long since found a quiet resting place in the far beyond of all good automobiles, or had been banished to the depth of the rural districts. The "heavy coughers" of the vintage of 1901 and 1902 ran side by side with the silent running, high powered models of the present year that so completely overshadowed their predecessors, but it was a noticeable fact that the oldtimers got along under their own power without any difficulty, and, while they were lacking in speed, they "got there just the same," and few were left stranded by the wayside. The seven ages of the automobile were prominently in evidence wherever one looked—from the little "teakettle" of 1900 to the latest 60 horsepower 1906 model touring car, all degrees of age, size and length of servitude were well represented, and together formed a sight long to be remembered.

FIRST MAXWELL TRUCK

Tarrytown's Big Concerns Begins the Building of Business Vehicles—Features of Them.

The Maxwell truck has entered the realm of commercial vehicles. The first that was known of it, or at any rate, the first that was seen of it, was on the occasion of the Vanderbilt Cup race, when the truck appeared on the Long Island course carrying a number of the employes of the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., by whom, of course, it was designed and built. The truck is of 18 horsepower and as far as possible incorporates the same features as the Maxwell touring car, thus rendering it possible to readily obtain parts for replacement.

It is built very high in front, giving a great deal of space for cargo, and with all tanks full weighs 2,600 pounds. The company will engage extensively in the construction and sale of these trucks.

The gasolene motor is of the double opposed type, 5x5½ inches and is rated at 18 horsepower at 1,000 revolutions per minute. Both inlet and exhaust valves are mechanically operated. A special feature of the engine is that by loosening six bolts, the valve motion case can be lifted from the engine case on which it rests, thus rendering accessible the connecting rods and the wrist pin. The crank and transmission case is hung at three points, following the principle of Maxwell three-point suspension.

The engine and transmission case are of aluminum casting, insuring a rigid construction and making it impossible for the gears or shafts to get out of alignment.

The transmission is of the sliding gear type, employing three speeds forward and one reverse, with a maximum speed of eighteen miles per hour. All gears are drop forgings, after which they are cut and hardened.

The bearings in the engine case are bronze shelled, babbit lined. Those in the transmission case are of the plain babbited construction. A feature in connection with the engine is that any wear occurring on the engine bearings can be taken up and bearings adjusted without removing either the transmission or the engine case covers, the adjustments being controlled by set screws located at the bottom of the engine case. The adjustment of main bearings has heretofore been regarded as a laborious undertaking, but by this arrangement it is possible to readily compensate for wear, making it a particularly desirable acquisition in a truck.

The ignition is by jump-spark, the source of current being two sets of dry batteries.

The rear axle and drive shaft have been thoroughly tested out and have proven their efficiency on the Maxwell touring cars and tourabouts, though the axles on the truck are made proportionately heavier.

The drive shaft employs two universal joints, having ample facilities for holding grease. The rear axle is provided with the Hyatt roller bearing, no balls being used in the construction. The side thrust inherent to the bevel gear construction is taken up by a blank roller of the same size of drive pinion. This being fitted against the smooth bevel surface of drive gear, holds the latter up to its work, making it impossible for it to get out of alignment. All metal parts are positively oiled by sight feed compression oilers.

The clutch is of the multiple disc type, these being held in engagement by a powerful spring. The construction of this clutch makes it impossible to strain the mechanism by too sudden engagement. The gears are also provided with a suitable lock, making stripping due to carelessness of operation practically impossible.

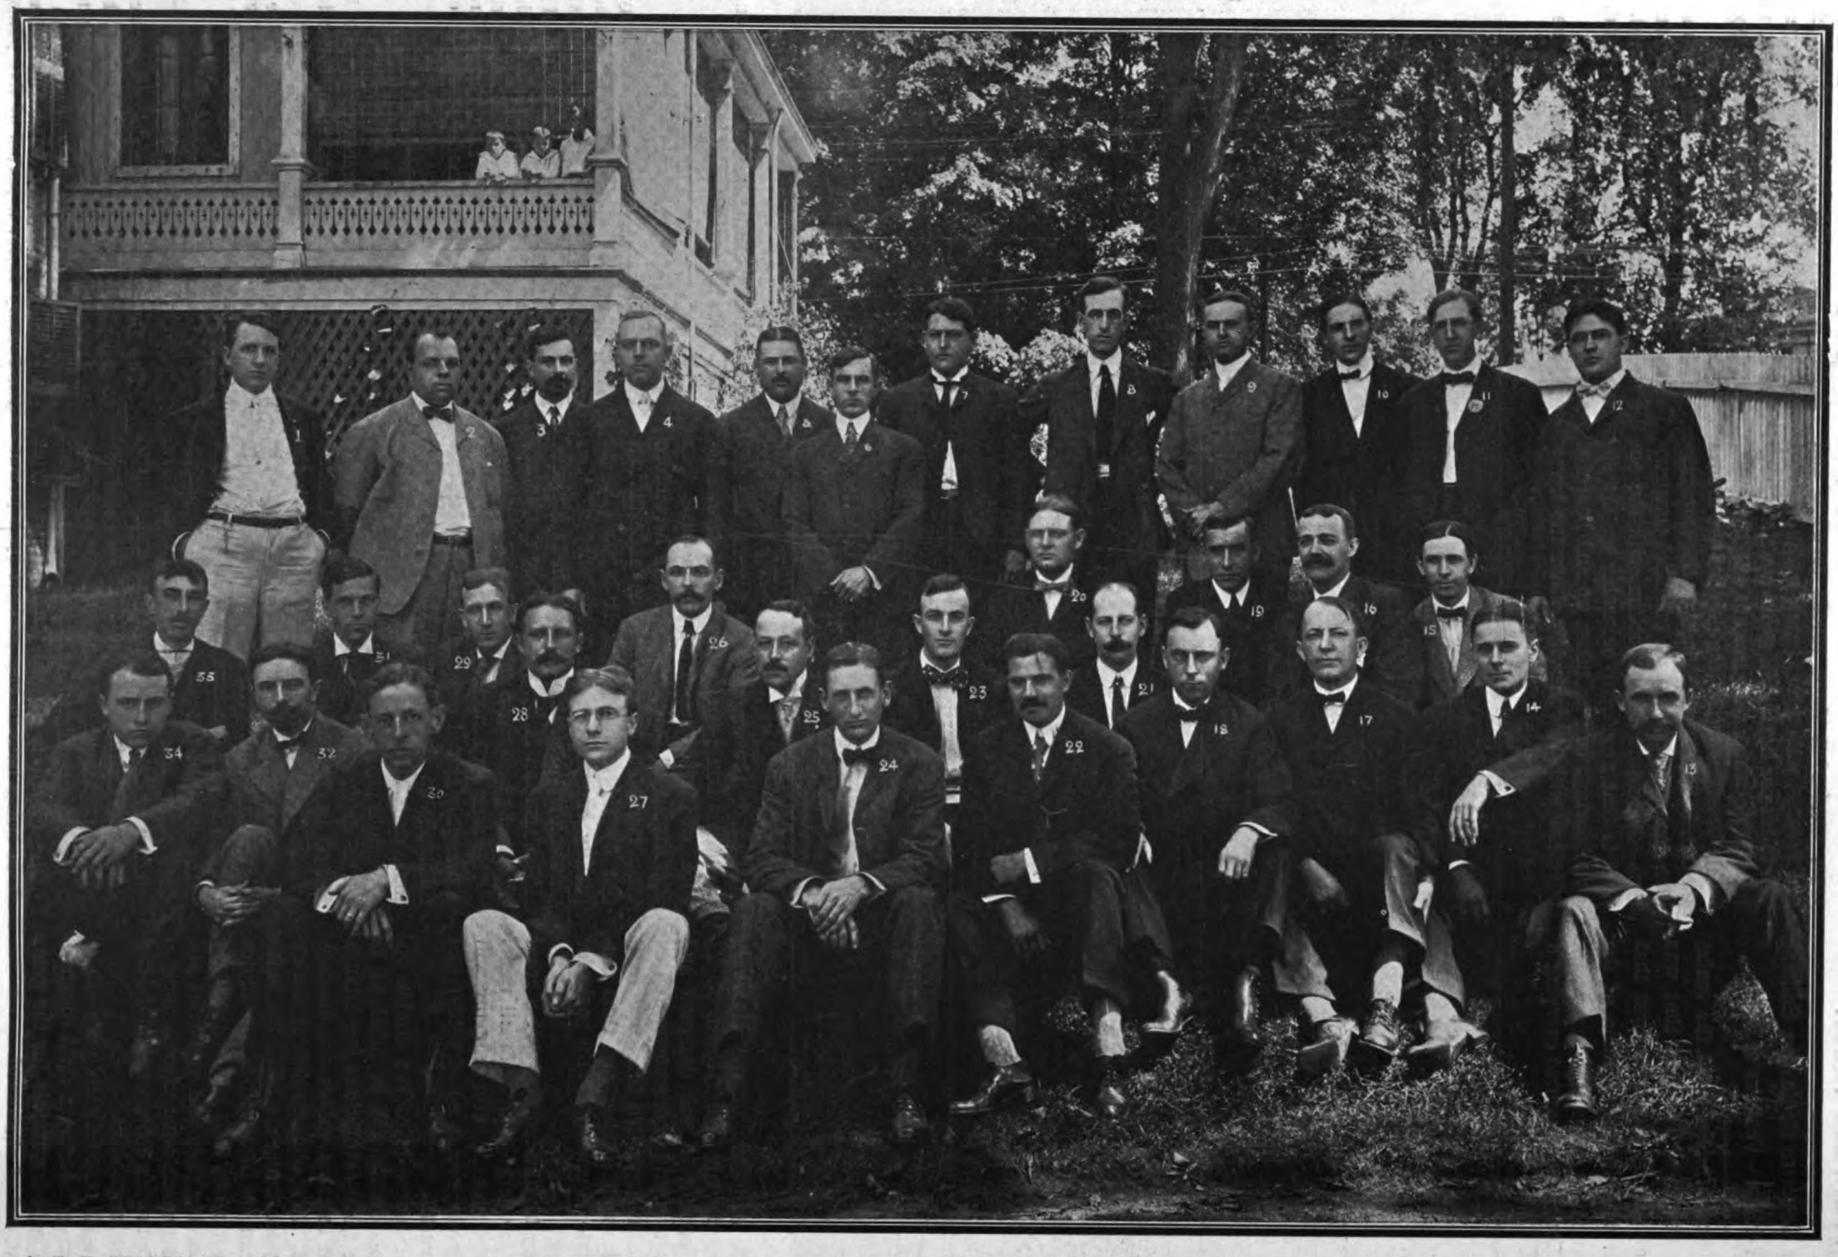
The body is of wood provided with suitable sides. The springs have been carefully designed and are amply proportioned. The wheels are 32x4 rear, and 32x3½ front, Firestone solid tires being used.

The floor space is 10½ feet by 6 feet wide. The normal working load is one and one-half tons, with a maximum of two tons.

To Make Fire Engines.

The International Power Company has taken over the Amoskeag Fire Engine Co., of Manchester, N. H., and it is stated will use the plant for the manufacture of automobile fire engines, a number of which already had been produced. D. A. Burt, formerly manager of the La France Fire Engine Co., has been made manager of the Power company.

To Introduce a Dutch Car.



Sidney S. Dixon, representing the Dutch firm of Spyker Brothers, is en route to this country with a view of seeking an American connection for the Spyker car, the dustlessness of which is a conspicuous feature. Mr. Dixon will stop at the St. Regis while in New York.

Doris Will Begin Nov. 21.

The Dorris Motor Car Co., who succeeded to the plant in St. Louis left vacant by the St. Louis Motor Car Co., when the latter removed to Peoria, Ill., expect to begin operations on November 1. The Dorris lease of the factory is for a period of five years.

LOOKING DOWN ON THE RACE

How the Contest for the Vanderbilt Cup Impressed and Affected the Man "Up Aloft."

It does not seem possible that a few feet—and those few vertically in the air—could make such a difference, but, looking down from the roof of the press stand upon a flying streak of dun colored noise that flashed between two lanes of eager faces was to experience a totally different sensation than that felt by seeing the same machine and the same men hurtle by when on the ground. It was something akin to the difference in looking at people from the street level and gazing down upon them from the top of a tall building, except that the shorter distance made possible the observance of every detail. Add to this the fact that the observer was at the same time the photographer, and a further distinction must be made for the keenness of the professional picture-taking eye for pose and detail, which must also be taken into consideration. Then, again, it was a point of vantage that offered a view of the car from within a moment or two of the time the bugler sounded his warning of its coming, until growing larger with each fraction of a second it had breasted the grandstand, shot past and almost in the same breath disappeared down the seemingly endless line of human faces that stretched out in a well defined lane of humanity-inclosed, oiled road toward the Jericho turn.

But it was the sight of the cars as they passed through the walled-in stretch represented by the press and grandstand that was well worth the climb to the height afforded by the roof of the former. Once the busy spell occasioned by trying to record the spectacle occasioned by the smoke and fire belching cars as they started off one after another out of the cloud of vapor—the sun as yet scarcely above the horizon and the all pervading October morning mist making things doubly difficult—there was nothing to do but to await the coming of the competitors on the first round; the passing of several rounds in idleness, in fact, for the light before 7 a. m. at this time of the year is not conducive to the accurate recording of the image of a flying apparition at nearly eighty miles an hour. Nor of anything else moving for that matter; lenses, shutters and plates, photography in general, has its limitations.

Within a second or two of the time that the bugler sounded his monotonous call—frequently before he finished it—a black speck would appear a mile or more down the road toward Hyde Park, as yet invisible to the occupants of the stands below, and, growing momentarily, would flash by in a roar, with every part rocking and swaying, the steering wheel jolting in the driver's hand at every inequality of the road and with both occupants of what appeared to be little less than a flying shell swaying and bending in unison with the movement of the car. Those on the ground described the sight as thrilling, but to the photographer on the roof, who could gaze directly down upon it, there was something more than that to it; the passage of the first few cars occasioned a feeling at the pit of the stomach much akin to that produced by the sudden dropping of an elevator; every instant it seemed certain that both occupants were about to be hurled into something, or as if the car itself was doomed to spontaneous destruction, leaving them distributed promiscuously in gory pieces over the road and adjacent scenery. This was the consensus of opinion of those who watched the cars go by from the roof, and, although one became somewhat accustomed to the sight, even the photographer, there remained that feeling that something was about to happen to the car.

Gasolene Delivered Milkman Fashion.

A rather good suggestion for the local dealer comes from across the pond in the shape of an item to the effect that a firm has lately taken up the practice of delivering gasolene at the private stables of its clients every morning, thus following the milkman about with the day's supply of fuel for the machine. At the same time the machine, which is specially constructed for the purpose, takes or delivers, as the case may be, tires or small parts, which the house in question repairs and subsequently returns to the owner without extra charge.

Horse Oddly Kills a Motorist.

When the automobile meets its forerunner the horse on the highway the latter is usually the sufferer in case of a disagreement as to the right of way, but a Massachusetts equine recently took it into its head to set up a new precedent and when run into by a party in a car from Holyoke, promptly proceeded to climb into the automobile. In so doing the owner of the car, a Dr. Menard, was jammed between the steering wheel and the seat, injuring him so seriously that he died a few hours later.

Thomas Will Await France's Decision.

Pending the receipt of conclusive advices from the Automobile Club of France defining its attitude toward the Vanderbilt Cup races of the future, E. R. Thomas, of Buffalo, will permit his cup plans to rest. He states that the interest displayed in his proposal to offer a trophy for competition between American cars was very gratifying, several prominent manufacturers having assured him of their willingness to build special cars to compete for his trophy.

So successful was the race meet held by the New Jersey Automobile and Motor Club at the Waverly track last month that the club has another meet on the tapis for Election Day, November 7. A good field of local stock cars is assured.

FOR SPECIAL MOTOR ROADWAYS

Old Proposal in New Guise Crops up Abroad —Surveys Said to Have Been Made.

Cables from London state that a bill has been prepared and will be introduced into Parliament, which, if passed, will enable its promotors to construct a system of roads which will be especially reserved for the purpose of motor traffic, a much mooted subject. A decision will be rendered at the forthcoming session. Sir Douglas Fox, an eminent engineer, has been retained as consultant, and his sponsorship of the scheme seems to lend credence to the statement that the organization is complete and able.

It is proposed to construct as a beginning, a system of roads leading from London to Southampton, Portsmouth, Brighton and Dover. The main road, which will lead to Brighton, will be joined near Coulsdon and Merstham by the branches to Southampton, Portsmouth and Dover, the total length of the right of way aggregating something like 166 miles.

Of the manner of constructing and maintaining the highway nothing has yet been given out, but it is known that the promoters will seek Parliamentary powers to forcibly take up the necessary lands "for a railless road." Short leading in roads from the ordinary highways will be built, and the entrances to these will be guarded by toll-keepers, who will be responsible for the admission of suitable traffic only, and the clearing of the way of children and animals. It is also proposed to divide the road by a walk, thus keeping the traffic going in opposite directions effectually separated.

Although the project is of but recent growth, it is stated that surveyors are already at work upon the route, and that there is every indication that it will be carried through to a successful issue. Apparently the movement is quite independent of either the Roads Improvement Association or the automobile club.

Two Clubs Choose Officials.

W. S. Belding was unanimously re-elected president of the Automobile Club of Maryland at the annual meeting. Other officers chosen were: Vice-president, R. J. Leupold; secretary, George S. Dickey; treasurer, Ernest J. Knabe, Jr. Messrs. Yellott, Keyser and Reese were appointed a committee to secure favorable legislation at the next General Assembly.

At the first meeting of the Milwaukee (Wis.) Automobile Club since its organization as a corporation, held last week, the following officers for the ensuing club year were elected: President, Sherburn M. Becker; first vice-president, Dr. Louis Fuldner; second vice-president, F. G. Curtis; secretary, James T. Drought; treasurer, William H Pipkorn.

ABOUT VULCANIZATION

Features of that All-Important Tire Process that are not Generally Understood

To the average individual who is compelled upon occasion to do his own tire repairing, vulcanization means "healing the rubber" until the patch or particular repair under consideration becomes incorporated with the shoe or whatever the foundation may happen to be. Ordinarily of course, the tire goes to the professional repairer and the owner's only connection with the job is paying for it. But it is just as well to know a little more definitely just what vulcanization does imply, particularly as the day of the "do it at home" portable apparatus for this purpose is not far away. Such things are in fact already on the market on the other side, one style being recommended for carrying on the car so that the repair may be vulcanized "while you wait."

As a preliminary it is just as well to bear in mind some of the stages the crude rubber passes through before it becomes a tire. So far as its use for everyday purposes is concerned, raw rubber is of small value. It must first be relieved of all foreign matter such as dirt and chips that adhere to it and become incorporated in the mass of sticky, vile smelling substance that constitutes the product as it comes to the hands of the manufacturer. To do this it is passed through tremendous rolls washed, rolled and washed again, until entirely clean and then hung up in huge white sheets to dry. It is then ready for the curing a process which differs more or less in every factory, for from the earliest days of the rubber industry, this question of how best to prepare and cure it has absolved, and still is for that matter, taking most of the time and attention of a number of experts. Various chemical agents are employed, chief among them being sulphur, owing to its cheapness and ease of working. But it would be impossible to go into detail on this branch of the subject for therein lie the carefully guarded secrets of the business that are handed down from father to son. What may be best for the purpose and how to employ it to the greatest advantage can hardly be termed settled questions for chemistry without number are constantly experimenting with an eye toward improvement in this direction. However that may be, the materials are specially blended and compounded under the eye of the expert chemist well versed in the peculiarities of the substance, so that this is hardly a matter with which the amateur will ever have to deal. There is also considerable difference of opinion as to the length of time required to properly cure the crude rubber and bring it to a state where it is ready for vulcanization, this varying from days to months.

In the conversion of the cured rubber into what is known as vulcanized rubber, a certain degree of heat applied for a stated length of time is necessary to bring about the chemical change, the duration of the process varying according to the nature of the chemical compound employed, but in all cases vulcanization is arrested at the moment that the rubber has reached the stage at which it is in its most elastic and durable form suited to commercial application; for instance in the manufacture of inner tubes and shoes, the process is brought to an end at the point where the conversion is deemed to be complete for the purpose to which it is to be used. Beyond this any further application of heat has an injurious effect on the rubber and if permitted to continue sufficiently long it would finally arrive at a stage where it would become hard and brittle forming the material commonly known as vulcanite and totally unsuited for tire uses.

From this it will be apparent that it is impossible to vulcanize a patch or other repair without also continuing the process of vulcanization to those parts of the tube or shoe again brought in contact with the heated surface that surrounds the spot being worked. Thus in producing materials for what may aptly be termed local repairs, the rubber chemist has if anything, a more difficult task than at the outset, for he must prepare compounds which will in the course of periods necessarily but a fraction of those originally devoted to the operation, often 20 to 30 minutes, vulcanize and amalgamate with the foundations which may have been, as in the case of a shoe, hours under treatment. The object in view is naturally to subject the already vulcanized portion to the shortest possible heating while effecting the repair. It must be borne in mind that this cannot be accomplished without carrying the vulcanizing process a step further toward the hard or vulcanite stage already referred to. This will doubtless explain to the novice who has tried his hand at it, why after failing to make a satisfactory job of placing a patch or closing a bad cut at the first application, and the attempt has been repeated a few times, the rubber adjacent to the spot worked on is found to have assumed different characteristics from the remainder of the tire. Such treatment of an inner tube would doubtless result in the repair giving way upon inflation or not long after, and upon examination the material would be found to have become either a mass of cracks or porous and flabby.

It will readily be seen from the foregoing that failure to effect a clean and sound, as well as rapid repair at the first trial can only result in deteriorating the article under repair by repeating the attempt, which, if carried far enough will end in its ruin by fatally changing its qualities, such as forming a resilient into a hard and brittle substance.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau Street, New York.

KEEPS LABORERS AWAKE

How the Motor Car Accomplishes that Useful Service in the Far East.

Its adaptability to both passenger and freight service about town and in schedule rural work, the motor car has already demonstrated to the satisfaction of those who have given it anything like a fair trial. Its imperative need of good road conditions has, however, seemed to bar it from service in any sort of pioneer work up to the present time. The following glowing testimonial from the correspondent of a contemporary who has used a touring car to great advantage in railway construction work, where the scope of his labors has been greatly enhanced by its adoption, is very significant. He says:

"It is almost impossible to calculate the great value of a motor car during railway construction, more especially in India. The usual routine of a gang is to work hard during the presence of an official, and on his departure to spend a greater portion of the remainder of the working day in sleep. If far away from headquarters it was only now and then that the chief engineer could visit each individual work when horses were used; with a motor car every part of the work on a short line can be inspected daily, and no one can say when the dreaded chief will put in an appearance. I am also convinced that long before the construction is finished the cost of my car will have been saved by the reduction in the number of subordinate officials made possible by rapid locomotion."

Inducements to Chauffeurs.

A firm of London manufacturers has offered a very handsome inducement to chauffeurs who handle the machines under their care in an economical manner by putting up prizes of $5, together with a certificate of excellence, which will be given to all drivers of their cars who cover a total distance of five thousand miles at a total cost of $90 for the 10-12 horsepower model to $310 for the 24-30 type. This works out at something like .018 to .062 cent per mile, and is to include all items of expense, including tires and supplies.

Why London's Cops are so Active.

An explanation that sheds a flood of light upon the intense zeal displayed by the English "bobby" in apprehending the motorist who is so indiscreet as to exceed the legal limit by a hundredth of a mile is to be found in the fact that "Robert" is working for his own pocket all the time. The fines go to the police pension fund, and, judging from the amount collected in the last twelve months—something like $1,500,000—the superannuated "peelers" of the "tight little isle" should have nothing to fear for some time to come.

The Lady in the Landaulet.

There can be little doubt that the increase in the use of the various forms of closed body will be marked even more during the coming winter than it has been during the current year, for the art of body building has reached such a fine point, and the creations along this line are so appealing to all the senses of the user that even setting aside the dictates of fashion, the closed car is likely to prove quite irresistible to every buyer who "has the price."

Anticipating a greater demand this year than ever before for these types of "carrosserie," the makers are one and all getting out their "de luxe editions" as early as possible, several magnificent specimens of the 1906 models already being in evidence.

The accompanying illustration is of one of the number—the new White Landaulet, mounted on the 1906 chassis, which is distinctly different from the older models in appearance as well as in point of design. That the car is an impressive one a glance will suffice to show.

Women Who Would be Chauffeurs.

According to the manager of a Chicago automobile school, there are quite a few women in the Windy City who have the "chauffeur bug"; they think they want to become professional drivers. These women applicants find it plain enough sailing until they come to the question of about crawling under the car, on a muddy street to repair something wrong with the mechanism, at which most of them balk. Some are even willing to assert that this is not too much for their ambition to overcome, but their determination must wilt upon more mature deliberation for few of them ever call more than once.

A retail dealer, who is not an American, having just installed a motor delivery, has adopted the catch phrase, "Buy a piano and have it delivered at your door before you get home." His faith in the speed of the commercial motor vehicle is delightful to contemplate.

Vastness of Second-Hand Sales.

Some idea of the vastness of the second hand automobile trade in London may be gained from the summary of the business of a large exchange house there which has just closed its books for the fiscal year. The total volume of business done represents something like $1,309,000 in round numbers, which amounts to $20,200 in weekly receipts. This has come from the sale of 1,879 cars and 539 motorcycles in all, or an average of 47 vehicles disposed of during each week.

Fifth Avenue Stage Line Falters.

From the fryingpan into the fire, would seem to represent the present status of New York's Fifth avenue stage line. For a number of years the company has been issuing periodical promises as to the abandonment of the generation old plugs and "deadwood" coaches that have been an eyesore for so long. With equal regularity it has kept on promising and neglecting to "make good." The solitary electric 'bus which was so exclusive and apparently considered such a luxury that double fare was charged on it was discarded as being too small to pay. But in accordance with the latest promise another sample is being tried; it is said to be a monstrosity of over 30 feet in length and so broad that it takes up more than half of Fifth avenue.

"Back to the old time nags rather than this," is the Fifth avenue consensus of opinion as the result of a few trial trips of the new ark, which in addition to being so cumbersome that it leaves no room for anything else, is so slow and underpowered that it cannot get out of its own way. On one of its trips last week it stalled on the grade above Thirty-Fourth street and afforded ten minutes' amusement for an interested crowd that watched its vain attempts to negotiate the slippery asphalt until relief came in the shape of a sprinkling of sand. Coach men and even cabbies gave the monster 'bus a wide berth, and its great size and the manner in which it monopolized the road in its immediate neighborhood as it went along led many to wonder what Fifth avenue would be like with a hundred such vehicles on it.

For Those with Cold Feet.

Those motorists who suffer from cold feet and ankles during the winter months should have their machines equipped with doors to the footboards, such as are fitted regularly to one or two of the foreign cars. If not convenient to have these made of wood or metal and fitted permanently, a very good thing to do is to have them made of dashboard leather, such as is used in buggies, strengthened with a wire framework, which need not be heavily made, and fastened in place by means of swivel buttons like those used in fastening the boots and cheeks of carriages. The door which is to go on the driver's side need not be as readily detachable as the other, and may be as high as is possible without interfering with the handling of the levers. The other should be readily demountable, and should not be too high to prevent one's stepping over it in case of need.

Long Island Line That Paid.

In an open letter to the public recently sent out, the management of the Long Island Automobile Observation Co., which has been operating a single machine on the route between Huntington and Amityville, Long Island, during the present season, reports a daily income varying from $35.30 on good days to $1.60 in bad weather, which averages something like $18.60 for the period during the month of August, which is quoted. During this time the daily expenses ranged from $7 to $8, including running repairs.

It is proposed to reorganize before the beginning of the year, with sufficient capital so that three more machines may be purchased. The plan is to operate two machines regularly on the Huntington-Amityville route, each making at least two round trips a day, and to use a third for tripper service to Huntington Harbor on boat days and for general livery service. The fourth car is intended to be held in reserve at all times for emergency work in relieving the machines which are on schedule in case they break down.

This Tire is Insect Proof.

"Water, rot, insect and puncture proof" is the modest recommendation outlining but a few of the many advantages of the very latest revolutionizer that is to make the pneumatic tire a back number. It comes from Minneapolis, and is a variation of the old, old story of the spring wheel, with just sufficient flavor of novelty about it to make it worth while recording.

It is termed the Hodgson tire, and gets its resilience from a series of helical springs placed around the rim and compressed to a point where their resistance is sufficient to carry the weight of the car without further compression. Steel wire cable is then wound round the outer face of the series of springs to form an outer rim or tread to the wheel, and also to keep the springs in a state of compression. Over this is wound a chemically prepared textile fabric which is the foundation of the "water, rot and insect proof" recommendation. The whole rim is then covered with a rubber case that comes down over the sides of the springs and is clamped to the wooden rim in much the same manner as the ordinary pneumatic tire. Modifications of this part of the construction call for a rim of several layers of leather armed with brass or steel studs, or a steel rim of the regulation type for heavy trucks.

Winter Protection of Steering Gear.

Protection for the joints of the steering gear is a necessity at all times, but never more necessary than when mud and ice are most prevalent, as in cold weather. For this purpose many cars are provided with leather coverings on the joints when sent out from the factory. This is a desirable provision, and if not already made on the car as received it will prove a wise piece of forethought to supply it, regardless of the weather. The joints should first be well washed with kerosene or gasolene, and then covered with heavy grease, after which the whole should be inclosed in a flexible leather casing, neatly sewn around the joint. If a well fitting and neat appearing job is wanted the services of a harness or shoe maker will be desirable.

Worcester Sees Some Skidding Stunts.

Part of the population of Worcester, Mass., was recently treated to an impromptu exhibition of "skidding," which left behind an impression of what the automobile is capable of in this direction when it starts in to perform. Nothing ever happens off Main street in a small city, so, of course, this street was the scene of action.

The actors were one laundry wagon in motion down the centre of the aforesaid Main street at the peaceful and law-abiding limit of six miles per; one other wagon, classification not given, lawfully standing still at the curb, and one automobile, which, of course, came "tearing down" the same Main street and tried to pass between the two wagons in order to "cut in" ahead of the laundry delivery. Everything proceeded as planned until the rear wheel of the car struck the front leg of the clothes horse, and then things began to happen. The car did the "circle, face your partner and salute" act in great style, while a number of local citizens looked on in open mouthed astonishment. Then it kept right on sliding sidewise down the street until it ended up diagonally across the car tracks a few lengths away, heading back in the direction from which it had originally come. Local opinion was divided as to the cause of the remarkable stunt, but finally attributed it to the uncertainty of automobile management. Strange to relate, no damage was done to the horse, car or the occupants of either vehicle, although both did some powerful thinking for a moment or two, especially the chauffeur. The animal did not even lose its footing.

Old Yarn in English Dress

The motor car had just reached a nice level stretch of road, and the man in goggles was preparing for a scorch, when an honest eyed old countryman stepped from the hedgeside and held up his hand.

"Reckon you was jes' goin' to slip along tidy fast," he observed when the motor was brought to a standstill.

The motorist gave no denial to the statement. "What made you ask?" he inquired.

The bucolic one produced a pair of battered field glasses.

"Clap your eyes to these 'ere," he remarked, "and look up that there tree along the road. Happen you'll see something as'll make you change your mind.

"Great Scot! A police trap!" exclaimed the motorist as he discerned a blue trousered figure perched on a branch. "Thanks, old friend," and the clink of coins was heard.

A minute later a motor car was crawling past the tree at six miles an hour, while its driver waved his hand airily to the figure above. Two hundred yards back an innocent looking old countryman was counting his wealth and smiling.

"That there idea of cartin' that scarecrow from the peafield and fixin' of it to the tree," he chuckled, "worn't 'arf bad."—(Tit Bits.

THE TALE OF A SECOND-HAND

Being the Not Unfamiliar Narrative of the Unconcluded Tour of a Bargain Hunter.

They were all devotees of the car and the post prandial interchange of experiences had covered every topic imaginable, from the massacre of poultry at eighty miles an hour up to wayside carburretter adjustment, each giving way as the next narrator took the floor after a short period of silence when all would cast about half sheepishly to see who the next Munchausen would be. From tires to gears, gears to clutches, all over the motor and back again went the contributions of personal experiences in trouble hunting and conquering, until the range of possible mechanical defection to which steel and copper could be subject seemed to have been thoroughly covered.

It was the monthly club dinner, or had been, for the gathering had progressed to the coffee and cigar story telling stage, and every one was vieing with his neighbor and the assemblage at large to add something to the general fund of information without getting on to the tacitly forbidden subject of speeding, and particularly night violations of common sense. Every one had had occasion to meet and conquer more or less minor ailments to his car during the past thirty days, but somehow or other they didn't make the interesting telling that a night ride that had all past performances for speed faded. Records were the thing, and what more exciting than rushing along under the trees with that dazzling white twin shaft piercing the darkness, hand and foot tense, every nerve ready for what might be around the corner. But what was the use; every new silence brought apprehensive glances at the first speaker with the expectation that he at least might be the one to break the taboo.

"Yes, same old story; two hours looking over everything but the inside of the tank. We lent them a few pints of gasolene, didn't have overmuch ourselves," concluded the last speaker dejectedly when a new arrival silently came in, helped himself to a cigar and tried to fade into the smoke of the smoke unnoticed. But all to no purpose.

"There's Ollie," chirped one, and in a moment there was a general acclaim. "It's Ollie's turn. He hasn't told a story in three months. How about that car you bought at the beginning of the season to go on a tour and came back without? Yes, how about that car? Give us a change of subject. Why did you come back on the train? Where's the car?"

"I suppose I may as well make a clean breast of it, and there couldn't be a more appreciative audience," said the victim. "My entrance into this charmed circle did not happen until some time after that affair, and I kept the secret so well I had come to regard it as what the diplomats are fond of terming a 'closed incident,' but as long as I'm cornered I'll come up to the scratch.

"First, let me make my confession of crime. That was a second-hand car," an announcement that called forth a collective groan. "It may be just as well to explain that I was about as raw a specimen where automobile knowledge is concerned as ever happened on this planet. Carnegie's book handouts, all of them, would fall short of holding what I didn't know about cars in general and about that particular make or any other. I was so ignorant that I fully realized my lack of knowledge, but I was a subscriber to almost every automobile magazine published. Technical matters always bored me. I had a supreme contempt of the greasy mechanic, so I invariably passed over explanations and descriptions of the inside of the car and concentrated my attention on the touring department. Reading the delightful experiences of Tom, Dick and Harry, rolling along through beautiful country, covering a hundred to two hundred miles a day without the faintest trouble, and all for the price of a few gallons of gasolene. It wasn't long before I was on fire to do the same thing. I saw myself holding the wheel of a big touring car and dashing along at thirty an hour in my dreams every night for months. Then a brilliant idea struck me. I would buy a car and take a run out home. I hadn't been home in eight years; had been going back to see the folks every summer, but put it off just as regularly as it came around. I felt like a two-year-old when I conceived the scheme of spending my vacation on a tour and a visit to the old people. The trip couldn't take more than a week at the most, according to the rate at which the touring parties in the magazines got around. There would be plenty of time to give everybody of my acquaintance a ride. My, how important I felt; if the Street had gone my way on a big deal I couldn't have been puffed up more. In my imagination every one of the boys that had stayed home in the village was bursting with jealousy. I was made. But the car hadn't been acquired yet; it was all in my imagination.

"It was a natural step from the touring department to the ads., and the way I studied them was a credit to their compilers. But every car was the best one ever made. There wasn't anything on it to get out of order, nothing short of breaking it up with an ax would ever cause it to stop or balk. Some of those ads. were like schoolboy exercises to me. I could repeat them backward or start in the middle and say them both ways without missing a recommendation.

" 'Four cylinder vertical motor of most approved type, constructed of extra special material throughout. Rated at 24 horsepower but has shown 40 on the brake. Automatic carburretters, sliding gear, three speeds and reverse, direct on high gear, no danger of stripping,' but you all know the rest, so there's no necessity of going any further with that speech."

"Huh, I gulped down the first one I read," grumbled one of the audience, sotto voce.

"While I was reciting advertising backwards and forwards to make up my mind whether what I needed was a two-cylinder or four-cylinder, or whether it should have 20 or 60 horsepower, or which particular allurement I should go down before, the cause of my undoing appeared in the shape of a seductive article written by some one with a fancy nom de plume. I think I would have risked hearing a sentence of $10 or ten days if I could only have got my hands on that fellow at the right time. His contribution was on 'How to buy a second-hand car.' "

" Now he's getting warm," came from nowhere in particular. "I thought that would be a good way to save a few centuries myself, but I was flagged in time and put my money in a new car."

"It isn't my set purpose and intention to discourage the sale of second-hand cars. I am about to unburden my soul though, and any one who has a hand-me-down in mind better make up his mind it's time to go home unless he thinks of going around first thing in the morning to call the deal off. The article that led me to ruin took up three or four pages of that issue of the magazine. Full of illustrations, photographs, every one of them, so far as I could see, those second-hand cars looked just the same as any one of the best evers in the advertising—a little better, I thought. More business like; looked as if they were useful as well as ornamental. Well, to cut that part of it short, the article was to the effect, 'Why buy a new car when you can't afford the price, and can get one that is just as well if not better for half the price?' Why, indeed, thought I to myself. Two thou' hadn't looked such a great deal when I was in the first hot flush of enthusiasm to pay a visit to the old home at the wheel of a big yellow touring car, but somehow or other it looked bigger and bigger every time I thought of it from then on.

"What was the use of putting out all that when possibly I could pick up something rare in the shape of a bargain for half? Or maybe even as low as eight hundred. The article said the market was flooded with them of all kinds, and said, by the way that many a four-cylinder vertical, you know the rest, had been knocked down at that. Owner needed the money, and all that. I forgot all those best ever ads as if they had never been written. Nothing but a second-hand for mine from then on. But there was a part of the article that worried me a good bit. Down about the last paragraph it said the second-hand car was not always what it seemed—beware of the dealer and his blandishments, and then it cut off short with 'To be continued in our next.' I did nothing but study second-hand dealers' ads. for a week while waiting for the next issue. Volumes of them. Cars from $125 up. All in absolutely perfect condition. I was in almost as much of a quandary as I had been about the best ever ads. That week finally came to an end and with it came the next issue of the paper with the second installment of the article. The minute I attempted it I began to realize there were a few things about an

Digitized by Google

automobile I wasn't familiar with. I won't bore you with detail, but it was Greek to me. Told how to examine clutches, bearings, valves, steering head and what not; according to it there could be more things wrong with a second-hand car than were ever included in my philosophy. But there was a ray of hope in it after all. Get an expert to look over a car for you before buying it. Any good mechanic can detect its weak points at first sight.

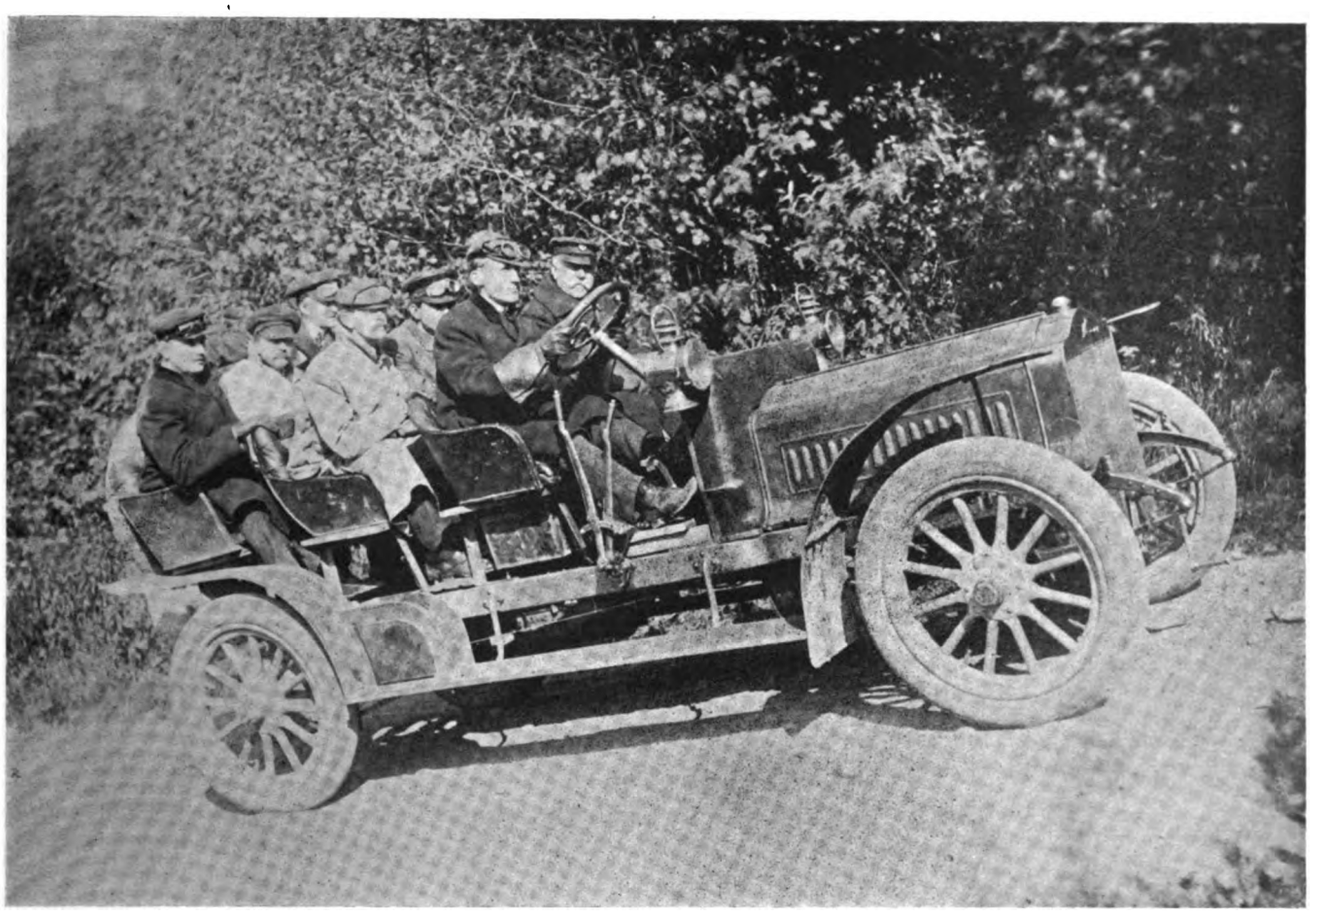
"I put a want ad. in the paper that very night for a good mechanic who knew how to run an automobile. It would be easy to kill two birds with one shot by hiring a mechanic to help buy the car and keep him to drive it, or rather to attend to the dirty work on the trip, for I never imagined any one but yours truly behind the wheel. Heaps of applications, of course. Stack of letters a yard high. To make a long story short, I took one of them who struck me as being wise to all the wrinkles of the game. He was, but not the way I anticipated. Never was confiding faith in human nature more rudely shaken.

"I stuffed my pocket full of newspaper clippings of bargains and we set forth. But he knew just where to find what I was looking for, and steered be to a place uptown. How I could have been so pig headed as not to notice that my new man and the salesman I was dickering with had some trade telepathic system of communication, and used it right under my nose, gets my gall. But to cut it short, after the two had arranged it to suit themselves and my man had settled the size of his rakeoff, they sold me the car. Twelve hundred was more than I had decided to pay for a second-hand car. The ads. were so alluringly worded about the big cars that were to be had for a song that I thought it would only be necessary for me to pick what I wanted at any old price. But she looked worth the price, every inch. She was a monster and heavy as a freight mogul as I learned later to my cost.

"They fooled around a bit filling up tanks and what not and after a seance with the crank, which I noticed my man delegated to the salesman, the motor buzzed and all three of us climbed in, the salesman at the wheel. Up Fifth avenue and through the park big as life. I could hardly sit still so anxious was I to hold on to that wheel. The fearful racket the motor made in a vain attempt to shake things to pieces every time we were held up was disconcerting, but that and many another thing not half as plain did not exist for me then. I found them out soon enough, however. I'll pass over the next two weeks of my motoring career; the subject is a painful one. The car was demonstrated daily for my benefit. I neglected business and everything else, and in the quiet stretches of the park I finally mastered the hang of that wheel and those pedals. In the mean time I simply fed that man with coin. According to him, that machine needed enough replacements and odds and ends in the mechanical line to fit up the engine room of a first class battleship.

Finally everything was ready for the 1,500-mile trip. A century and a half—twice as much as it would have cost to have made the round trip on the train in bang-up style—would hardly cover the cost of the clothes and stuff I bought myself. But a ten-dollar leather cap, a five-dollar pair of goggles and thirty-five more for a coat made me feel as I owned a whole automobile stud of imported cars. For safety sake I resigned the wheel to my man in the traffic, but got hold of it after we got out of the city and was sure the day of my dreams had at last come. Within less than a week I would be surprising all my old cronies with my style. We hadn't gone more than five miles when something went off under the bonnet like a two-dollar cannon cracker, and blue black smoke poured out from under the bonnet. How we stopped is a mystery, but I did it, that's certain. I grabbed for everything in sight, and if we hadn't stopped right then and there it would have been a case for the coroner, for when we did bring up we were headed dead at a telegraph pole and within two feet of it. I had twisted the wheel in my excitement, as well as everything else I could lay hold of.

My may Friday nosed around gingerly, for everything was red hot, cursing like a trooper. Funny I had never watched him closely before, but now I was out driving my own car I was going to learn the ins and outs, and I was onto every move he made. I began to have misgivings at the first glance, but it was too late to turn back. He fussed and fumed around, covering himself with grease and sweat ,and with every oath he let out my soul sunk further. It was plain his profanity was a screen for his ignorance. He didn't know the commutator from the carburetter, but finally in desperation said he had "fixed it" and got at the crank. She started right off and brought my spirits up again. We got about five miles further along—twelve was her top notch—everything serene and peaceful, when the firecracker performance was repeated, but nothing gave way and we kept on. All was calm again for another half hour or so, when she exploded three times in succession in less than a mile. That last was too much for my nerves, and I again pulled everything handy and stopped her. We were about ready for a fight to a finish as we climbed out opposite sides of the car glaring at each other. The only visible derangement was a loose end of wire dangling around, and after making a great bluff at fixing this Friday announced another start, and, sure enough, the first turn started her hammering away. I felt better again.



Well to summarize our stops for the day, and I speak now in the light of a vast store of since acquired wisdom, we were held up twice by the explosions, which were caused by a broken inlet valve on the third cylinder. There was a ragged p ece chipped off it amounting to a third of the valve. I found out that the cylinder had never been firing since the car had come into my possession up to that morning, and the last repairman who had honestly fixed the wiring was the cause of it.

"The compression stroke forced the gas out as quickly as it came in, and so there was no explosion, but about every once in so often the mixture would become just right and the explosion would shoot out that hole in the valve. The third time was too much for the plug, and that was why it didn't trouble us any more after that. How that ramshackle affair was kept going the two weeks I was practising with it home is a deep and dark mystery to me, for we made four stops more to adjust the tremblers, which kept sticking. Once just in time to prevent everything going heavenward, for half the water was gone and the rest boiling furiously. She actually blew off when the tank was opened. Only the trouble Friday had in finding water saved us walking ten miles to the nearest town, for everything was simply sizzling and cold water in the jackets then would have split everything to pieces. Ten hours on the road, eight stops and the odometer recorded forty-five miles since early noon. It was discouraging, but there was still some hope left and I wanted to get as far as possible so we determined to make a town eighteen miles away before putting up for the night.

Pitch blackness settled over the wooded road before we made half the distance and hungry, dirty and sore all over the slow plugging along behind those two feeble yellow shafts from the oil lamps was maddening. Friday was almost asleep and I was pretty nearly as bad when I began to realize that something must be on fire. Paint was burning somewhere and even where I was sitting was becoming uncomfortably warm. Before I made up my mind to do anything the motor gave a final sickly wheeze and died, standing there all aquiver with the heat and nauseating smell of burning paint and grease. Friday was through with trouble hunting and made straight for the crank, but he might just as well have tried to put the car in his pocket. He hauled until I thought he would burst a blood vessel but didn't succeed in moving it more than an eighth of a turn. I took pity on him and we got hold of it together and with a mighty heave gave her almost a full revolution when there was an ear splitting roar followed by a flash of fire from under the bonnet. In less time than it takes to tell it she was afire fore and aft and amidships. Like Napoleon watching Moscow go up in flames, I stood there after the first shock was over, folded my arms in utter resignation and watched my twelve hundred vanish until with the last splutter I was again in darkness. Then I looked for Friday and I'm looking yet. I hoofed it to the town still a good five miles and finished the trip in a sleeper. I hope the mystery of the strange disappearance of my first car is no longer such.

Putting a Safety Device to the Test.

One of the striking features of the latter models of cars which is coming more and more into prominence is the facility with which they can be handled on grades. Not simply an ample surplus store of power is necessary for this, but as well, the finest of braking equipments. Besides the regular brakes, many of the machines are now fitted with some sort of safety devices which prevent their rolling backward without the volition of the operator.

The illustration shows one such device being "put to the test"—the Thomas safety device as applied to the 1906 Thomas Flyer, fitted with a testing body, in which E. R. Thomas himself and the various department heads of the factory are caught in the act of trying out the Thomas invention on a twenty per cent grade. By the aid of this device the machine is enabled to stop and start again on even so steep a grade as this without using the brakes at all, and without straining the engine beyond its limit.

"Beating the Time Clock."

Time recording clocks have in the past year or so become a feature of most large garages and a prominent establishment in the Windy City recently added one of these "tab keepers" on the movements of its employees and cars and placed it in charge of the watchman, whereby hangs a tale. The watchman is well past his prime and for the first few days he was as tickled with it as a child with a new toy; he took particular delight in dropping the little cards into the slot, pushing the lever and ringing the bell.

But one of the chauffeurs looked upon the innovation with suspicion and finally became convinced that it was a snare to record his comings and goings and thereby bring him into disrepute with his employer, so he undertook to "beat the machine" and his performance gave the watchman a mild attack of heart disease. Starting at nine in the morning he took the car out and was of course, promptly "rung up." At 9.05 he returned and was marked in. At 9.20 he went out again and from then on continued an intermittent series of trips round the block and in and out of the garage, which made a line of "ins and outs" on the card that almost filled it and kept the watchman busy until the middle of theafternoon. The gray haired timekeeper smiled grimly but kept right on punching. Then the "hired man in the leather suit" rested a while but soon restarted the engine and stood by as if ready to leave at any moment. He let it run for an hour, the timekeeper waiting with the card in his hand ready to punch it. A short time after that a telephone message came from the owner and the car went out on its only legitimate exit that day. Half an hour later an urgent appeal that a supply of gasolene be sent to a point in the suburbs came over the telephone.

"Let him come and git it," was the ultimatum of the watchman to whom the request was referred. It was a crestfallen young man who climbed off a street car half an hour later and lugging a can of gasolene departed in the same manner. He has not tried to beat the machine since. A study of the day's cards showed that he had worked the clock to the extent of sixty-four "ins and outs."

Paris is to have a motor police brigade two hundred strong. Their duties should not prove burdensome under the extremely liberal policy of enforcing the law followed in the French capital, but they will be there to catch the occasional offender, nevertheless, and in order to demonstrate their fitness to know when he is violating the law they will be put through a rigorous examination.

FRANCE'S FAMOUS ROADS

How They Are Departmentized and Built—The Sand Surface that Prevents Mud.

So much has been written of the excellence of the roads to be found in all parts of France, and such a constantly increasing number of tourists go abroad each year to enjoy motoring over them that it will be of interest to learn how the country came to enjoy the advantages of such a perfect system of roads. As in England, the roads in France were for several centuries after the decline of the Roman Empire in a state of dilapidation owing to long continued neglect. In the latter part of the seventeenth century Louis XIV. had some good roads built in the vicinity of Paris, but it was not until near the end of the eighteenth century, or about 1775 that the real work of roadmaking, the result of which is now so prominently in evidence throughout the country, was undertaken. It was in the time of Napoleon I. that most of the great national roads which run through the country in various directions were built. These were constructed principally for military purposes and connected Paris with the French frontiers.

There are roads of varying degrees of importance in the system, all being classified according to who is responsible for their maintenance. First comes the Routes Nationales, which are constructed and maintained by the national government. Next to these in the order of importance come the Routes Departmentales, that are maintained by the several departments or provinces at the national expense. Next are "Chemins vicinaux de Grande Communication." and "de moyenne communication," the first being roads that pass through and connect two or more communes, and the second are of the same class, though of lesser importance. Both are maintained by the communes interested and served by them, aided by government grant in the case of the more important ones, while the others are under the control of the departments in which they are located. Still lower in the scale come the "Chemins de petite communication," maintained by the communes separately, under the supervision of government engineers. Last are the "Chemins ruraux," which may best be described as "parish" or local roads, and are maintained and wholly controlled by the commune in which they are situated.

For the most part the roads are flat, particularly between Boulogne and Paris. The standard of grade adopted is 3 in 100 for national roads, 4 in 100 for departmental roads, and for those of lesser importance 5 in 100. Except in very hilly districts or where traffic is too light to warrant the extra expenditure to keep down the grade, these standards have been adopted. This, taken together with the good climate, had been the reason why it has been so popular for automobiling right from the first, when powers were low.

The national road, of course, represents the best type, of which that leading from Paris through Fontainbleau to Lyons is a good example. This portion was originally paved, but the paving has since been lifted and six inches of macadam on a nine-inch foundation substituted. Curbs with drain channels three feet in width and of paving blocks flank it on both sides. This was done six years ago, and despite the fact that comparatively few repairs have been made in the mean time, the surface is said to be in excellent condition. Behind the curbs are lines of trees planted fully half a century ago and now in excellent condition. Beyond these trees are nine-foot equestrian paths, the curb being lowered or a grass verge being substituted at short intervals to allow of easy access to and from the paths. A special feature of this stretch of road is its straight line with slightly undulating gradient. Such a great length of straight road, however, makes rather monotonous travelling.

Some of these national roads which at an earlier period in their history were used for military purposes were originally paved with stone blocks. Some of this is still in existence, such as that near Versailles, but most of the "pavé," which is the execration of the motorist, has now been lifted, the stones used for a foundation and the surface macadamized.

In the early period of the construction of these roads, the earth formation was made horizontal and the bottoming eighteen inches thick in the middle and twelve inches at the sides, the convexity of the surface being formed with the materials, but one of the French engineers considered this excessive and introduced the rounded form of earth formation, with only ten inches of bottoming from side to side, and this is the method now generally adopted, both in France and England. But only about 9,000 miles out of the 22,000 miles of national roads in France are built in this manner with a hand-set foundation, the others being what are termed "broken stone" roads, the material being broken stone laid on promiscuously after the system introduced by Macadam. Some of the lower class roads are constructed of gravel and others of earth.

The materials used in the construction and maintenance of the roads vary according to the kind of stone found locally in the various provinces of the country. Some of the most common are millstone grit, white flint and flinty sandstone. The millstone grit is dug out of the ground, being found at a depth of three or four feet under the surface, while the sandstone is taken from such quarries as that of Marechaux. A standard quality of road materials has been adopted in France in order to determine the relative qualities of the various kinds of stone found in the country. The scale ranges from zero to 20, porphyry being the best, with a range of from 10 to 20, and pudding stone the lowest, from 4 to 8. Compared with this standard much of the material used is of medium quality, ranging from 8 to 13 in the scale, but it is evidently considered better economy to use the lower grade of stone found in the district than the better quality brought from a distance at a cost three times as great as that of the local stone.

These flinty freestones which, as already mentioned, comprise the bulk of material, wear fairly well under ordinary conditions, but gradually grind down under the weight of traffic into a fine white sand, and it is that which causes such an excess of dust on French roads in dry weather. On the surface of the majority of the roads in the country will be found this layer of sand of varying thickness. When it becomes excessive it is removed and left in heaps along the side of the road. Although this sand is a great nuisance on account of the clouds of dust it causes, its presence on the surface is rather an advantage than otherwise, as it tends to some extent to prevent the breaking up of the macadam in time of drought, and it does not cause mud in wet weather, as the sandy particles dry quickly after a rain, so there is not the evil of unlimited mud to deal with that prevails in this country.

Fire Extinguishing, Fort Wayne Style.

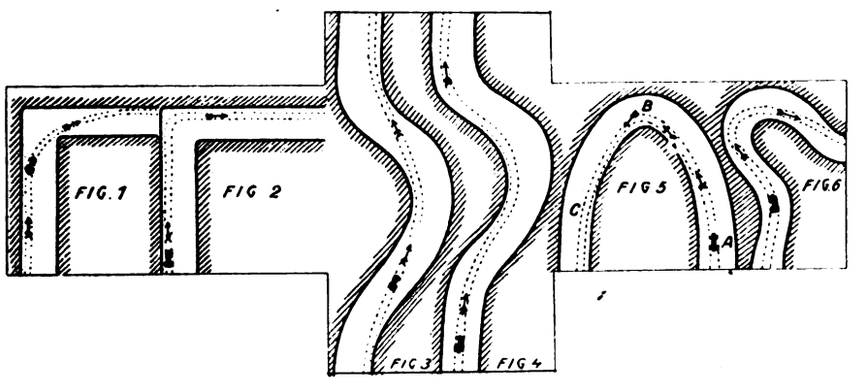
Here is the very latest in the automobile fire story line. Explosions of the gasolene tank have become such an utterly common rhetorical commodity that it really behooved the daily scribe to cast about for something new and here it is, fresh from Ft. Wayne, in the state of poets and authors, Indiana:

"Leaping into an automobile, with flames surrounding it on all sides from the burning gasolene in the tank, Will Peltier, of the Ft. Wayne garage started the machine against the wind and ran it so rapidly that the flames streamed out behind, only scorching the paint. When the fire had burned out he returned and found the owner of the machine, who had supposed it doomed and had accordingly deserted it."

Rochester's Appearing Prosperous Students.

From Rochester comes the news that the assembly of the class in gas engineering at the opening of the Mechanics Institute looked more like a meeting of the board of directors of the school than otherwise for the class includes some of the most prominent ment of that city, many of them have been operating their own cars for several seasons and others who have recently joined the ranks, but all of whom are at the mercy of hired men and repairers because of their ignorance of the principles and construction of the mechanism.

Purdue's Plant Nearly Completed.



Purdue University's automobile testing plant is now nearing completion in Lafayette, Ind. Tests for fuel consumption, horse power and general efficiency will be made, the plant being one of the most complete of its kind in the country. Some of the leading makers have promised to place cars at the disposal of the faculty for this purpose.

TAKING THE CURVES

The Several Ways of Doing so at Speed—American vs. Foreign Methods.

"How shall curves be taken?" is a question for the chauffeur that is asked and answered by the official representative of all the German and Austrian automobile clubs, besides a few others, the Allgemeine Automobile Zeitung. It is a question that must be answered from two points of view: How the curves shall be taken when racing and when touring. There is probably more to be said on the former score than on the latter, and in view of the widely varying methods adopted by the American and the foreign drivers in the Vanderbilt Cup race the subject is one of considerable interest.

Under such circumstances the driver can rest assured that the way is clear; he need have no lurking fear that hidden by a house or a clump of trees at the corner which shuts out the view there is some unseen obstacle that means disaster unless avoided. Where the tourist is concerned, safety lies in a moderate speed when the road cannot be plainly seen ahead for some distance, and in a close compliance with the rules of the road, which would mean taking all right angled turns as indicated in the sketch at Fig. 2, and proceeding similarly in every other case, regardless of the nature of the curve—that is, keeping well over to the right, under the American system, or to the left, under the English. So far as the tourist is concerned, there is very little to be said; it is merely a matter of common sense, and it is only when the dictates of the latter are utterly disregarded that the more or less frequent accidents that are given so much prominence occur. With racing it is a totally different proposition; it is a matter of speed at any cost short of annihilation, and there are scientific principles involved that the foreign drivers have apparently taken into consideration, but which the Americans apparently ignored.

These principles have been st closely studied and so well established in years of railroading experience that curves are now laid out on which it is possible to speed heavy trains at a rate that would justifiable have been denounced as suicidal not many years ago. But much of the data evolved in railroading practice does not apply to the automobile, for in the latter there is no limitation similar to that imposed by the rigid wheel base of the car trucks, which must always be considered in plotting a curve. The automobile is capable of turning in little more than its own length, and practically its only limitation is that of centrifugal force and the capability of the tires to withstand the strain imposed upon them. There is one principle, however, that should be so apparent to any one who has considered the subject at all as to scarcely call for comment, and that is that the length of its radius determines the characteristic of the curve; if it be short, the turn will be correspondingly abrupt and difficult to negotiate; in other words, the longer its radius the easier will be the turn.

That this was well recognized by the majority of the foreign drivers was obvious from the manner in which they "shaved" the inside of the turn instead of following the centre line of the road. When some distance from the turn such drivers as Lancia, whose control of the steering wheel aroused universal admiration during the Vanderbilt Cup race, kept over to the extreme right hand from which they headed past the corner, passing whatever obstruction happened to be situated on the latter by such a small margin that the spectators could readily have touched the driver without much effort in the way of stretching out the hand. After rounding the corner, leaving it was but a duplication of taking it; the course followed took the car to a point on the opposite side of the road a hundred yards or more away, and not until this had been gained was any attempt made to bring the car back to the crown of the road. This resulted in a long sweep of more than double the radius of the curve as laid by the road surveyor originally, as the latter based his calculations on the centre line of the road.

This manner of taking the curve is well illustrated by the sketch at Fig. 1, and its adaptation to the "S" and "hairpin" turns is shown in Figs. 3 and 6, while the practice adhered to by a number of the American drivers, although the turns taken were not quite as abrupt, as this would be impossible at high speed, is shown in Fig. 2. Their ideas with one or two exceptions seemed to be very much the same, and they were to keep as far away from obstacles as possible, which naturally meant as near the centre of the road as was practical under the circumstances.

English as it is Writ in India.

Automobiling apparently offers a stumbling block of serious dimensions to the Babu reporter, says the London Globe, as witness the appended gem culled from a Poona paper anent the recent East Indian reliability trials in which a number of cars participated:

"Captain Naylon and Mr. Swifte were the only ones to requisition the patrol supply at Shirwal fully laden and going strong. Mr. Lee cammie Panhard was next seen, and then followed The De Dion running the peculiar drive akin to this running Car. Silently Captain Evans and Colonel Russell's car approached. He seemed quite satisfied with his runs, more engine and passing Shirwal competitors. Mr. Harwood De Dietrick was, as it seems, but this sportsman did not deign to stop at Shirwal, which was a matter of comment by many. Mr. Lamb's Orleans came up and the owner did not understand the officials to running and required what it was meant for evidently not recognizing the fact that the Mr. Swifte's De Dion's tire futes with a Anti-skin looked a little bit groggy, but he was not abashed at this."

Horse Doctors Discuss Automobiles.

Veterinaries are beginning to fear that their occupation is fast disappearing, more than is the horse himself. With the latter it is probably not a matter of much concern. The president of the Royal College of Veterinary Surgeons recently thought it necessary to cheer up his fellow practitioners, and accordingly handed out the following convincing arguments to show that there was nothing for them to fear:

"Automobiles have displaced a few animals, but in many cases the owners have returned to horses. The first six months' work of an automobile, when everything is new and taut in the way of machinery, has deceived people into believing that it was its permanent condition. Owners, however, would have a rude awakening and be glad to resume horse haulage; in fact, he knew many who had done so already," a statement that brought forth a sickly smile on the part of his assembled confreers.

How the Swiss Cops Swell their Salaries.

Switzerland supplies the very latest "stunt" in police hold-ups. The local speed limit in one of the cantons is three and one-quarter miles an hour, for every violation of which the minion of the law demands blood money, cash on the spot. This is five francs, about $1, so that, compared with the farce conducted before a justice of the peace or magistrate which ends in a fine many times that amount, the procedure is quick and to the point, and on the whole economical. The Swiss policeman is a state pensioner, and is allowed to collect his own salary à la Dick Turpin.

HEATING THE MOTOR HOUSE

Perplexities that it Involves and Precautions that are Advisable or Necessary.

At this time of the year the problem of garage and stable heating and its probable or possible effect on the ever menacing fire risk comes up for consideration to the owner and the garage keeper as well. To some it causes little or no annoyance, for it has already been solved in past seasons, and the solution has proved to be so satisfactory that there seems to be no need for a change at the present time. To others it is a source of considerable worry, for it is by no means as simple as it at first may seem.

Not to go into details which have already been thrashed out over and over again in other years, it is sufficient to sum up the needs of a garage heating system very briefly. First, it should be so constructed that the unavoidable fumes of gasolene shall not in any way come into contact with flame or with metallic surfaces which are heated to any considerable degree. Second, the sources of heat on the various floors and rooms of the building should be so well diffused that there will be no intensely hot or intensely cold spots at any time, even during the very coldest winter weather. Third, the system should be both economical and flexible, so that it can be regulated to suit the conditions of a day which is extreme for the season without undue effort on the part of the operator, and should be capable of supplying just sufficient heat to maintain a uniform temperature at all times. Fourth, it should be so contrived as not to interfere in any way with the full amount of ventilation, which is essential to any building where inflammable materials are handled.

The rigorous application of the tests for all these conditions, of course, bars for all time the use of stoves and furnaces, either in rooms where cars are handled or stored, or in rooms which communicate directly with them; and also precludes the use of ill constructed and poorly insulated radiating systems. Also these considerations make necessary an added amount of care in the matter of the disposal of oily waste and refuse, which is likely to accumulate at all times, but which is far more dangerous during the time that the heating system is in use than in the warm weather. Then, too, it involves the careful disposition of all stores of supplies so that they shall not be subjected to a dangerous amount of heat.

Before the heating system of any garage is put into service for the first time in the fall it is most essential that it be gone over with great care to see that it has not suffered from rust or other injury during its period of idleness, and that the spaces behind radiators and heaters have not been used as convenient hiding places for old parts and dirty waste. In the tour of inspection all joints should be tested and connections made perfect, and all points where there is any danger that leakage or the high temperature which may be expected later on are doubly guarded from the peril of fire. At the same time it is well to look into the ventilating system, which, unfortunately, is totally inadequate if not wholly useless in most buildings which are used for garage purposes, to see that it is capable of taking care of the added amount of waste which the winter season is to put upon it and that it is in working order.

In this connection, too, it is well to sound a note of warning against the danger of overheating. It is not necessary to heat any garage or storeroom where cars are to be kept to a temperature greater than 55 to 70 degrees at any time. Not to exceed the maximum is to effect a considerable saving over the usual cost of operation of the average building. Yet in the cold weather there is a great tendency to raise the temperature to a point considerably above it, even to a point which is dangerous, all things considered.

To Make the Pit Safe.

An inspection pit which is properly constructed, is always provided with a ventilating flue which leads from the lowest point in its floor to an uptake preferably one of the main ventilators of the building, which has a strong draught; but even this precaution is not sufficient to guarantee the removal of all the gas which is likely to accumulate under a car when it is undergoing repairs, and therefore it is of the utmost importance that the repair man avoided the use of naked lights of any sort when at work. When a pit is not provided with any means of ventilation whatever, the caution becomes even more imperative. Recently, an English coroner and his jury were called to sit upon the case of a man who attempted to locate a nut which had been lost in such a pit, by the aid of a lighted match.

When Lighting the Lamps.

When lighting the lamps, it is well to remember that they will be less apt to smoke if turned very low, than if they are adjusted to the height at which they would be used were the machine not in motion. They should be allowed to burn for several minutes before the car is taken out on a run in order that they may have time to adjust themselves before the tremendous draught of the road is encountered.

New Use for the Torpedo.

As a dog and small boy preventive some motorists have adopted one of the latter's own weapons—the paper torpedo. It has the desired effect in every instance, and, moreover, has the saving advantage of being harmless, though somewhat startling.

USES OF THE WATER GAUGE

How it Serves to More than Tell the Tale of Water Circulation.

Though not of great importance, apparently, the use of a gauge connected with the water circulating system of the car yet proves itself of considerable benefit at one time and another, and is an accessory which the motorist can well afford to add to his machine. Its normal function of showing whether or not the cooling water is being properly circulated, though by no means vital, yet serves as a convenience in time of mishap, since it reveals a disordered condition of the system before the motor has time to heat, and in this way frequently saves a bad case of overheating when on the road.

Another use of the water gauge, in which service it proves to be a great convenience frequently, is in enabling the operator to judge of the speed of the motor without listening to it. This use is not to be appreciated until one has driven through heavy traffic a few times and had the roar of the streets so drown out the sound of the exhaust and the rattle of the valves that he is all at sea as to the manner in which his engine is performing and knows only by the "feel" of the clutch whether it is pulling properly and whether or not he is running on too high a gear.

Also, after a little practice, the driver learns to judge of the speed at which he is running by the position of the needle and the notch in which the gear lever is set the number of turns of the motor, of course, bearing a definite relation to the speed of the machine when the clutch is fully seated. Indeed, by careful calibration it would be perfectly possible to use the gauge as a speedometer by graduating it in accordance with a series of observations. But, at all events, in whatever capacity it be used, the observation of the water gauge soon becomes second nature to the driver, and its indications furnish a supply of information as to the performance of the motor which is only equalled by that furnished by the sense of hearing, and has the advantage of being readily interpreted, an advantage which mere sound alone does not always possess.

Use of Separate Cells.

Although the makers of the numerous electrical attachments which have been devised to be added to the car to increase its comfort and convenience, agree one and all that they can be connected with the batteries which are used for ignition, it is better for the motorist who has need of one or all of them to provide himself with a separate set of cells for their use. Those which serve the other purpose are far too important to have their serviceability in any way jeopardized.

THE ENGINE AS A BRAKE

Advantages that Come of Such Availability and Means of Obtaining Them.

A matter which has been a ground for controversy among automobile drivers ever since automobiles came to be, is the question as to the correct method of arranging the brake and clutch control of a car which is equipped with sliding gear transmission. With some it is considered of the greatest importance that the clutch pedal be interconnected with the brake pedal and lever, so that the former is withdrawn on the application of the latter. With others, it is thought to be of equal importance that the two functions be kept separate from one another so that the compression of the engine may be used for the purpose of a brake under certain conditions.

Whatever may be the common practice of skilled drivers in this respect, the fact remains that it is a great convenience to be able to cut off the motor and use its compression as a brake when descending long hills, and that in those machines which are fitted with a variable inlet which can be wholly shut off at will a very powerful brake is thus obtained without any danger of heating or the failure which menaces the ordinary type of brake at all times, no matter how well it may be constructed. One of the English builders has gone a step further than most of his fellows, and arranged the valve mechanism of his motor in such a way that moving the accelerator up to a certain point simply throttles the inlet, while a further motion in the same direction serves to open the exhaust valves during each down stroke of the piston, the inlets remaining closed, thus transforming the engine into an effective air compressor.

By this means the work of the motor may be modulated at the will of the driver from its maximum to nothin, and it may then be used as a powerful and even brake without any of the jerky or spasmodic action which occurs when the ignition is cut out for the same purpose. Moreover, there is no danger of injuring the muffler, as may sometimes be done with a motor not equipped in this way, from the accumulation of unburned gases which have been exhausted by the inactive cylinders. When it is desired to use the power again it is applied evenly and in as gradual degrees as is desired, so that the control of a machine thus fitted is said to be more nearly like that of an electric than of any other form of gasolene machine.

Fully aware of the claims of advantage which the users of the principle make for any system in which the almost entire control of the car is vested in a single lever, but somewhat doubtful of its reception should be attempt to use this system on his own cars, that indefatigable enthusiast, Cecil Edge, of the British Napier company, put the question to the court of public appeal recently and wrote a circular to his clients asking for their opinion on the matter of clutch and brake interconnections and the use of the engine as a brake. Of the replies which he received 6 per cent of his correspondents were in favor of interconnection, 35 preferred to have the emergency brake connected with the clutch as a safeguard, and 59 favored the independent arrangement.

If put to the same test in this country it is hard to tell just what verdict would be given. A number of the manufacturers of standard machines here still adhere to the interconnection and to the interlocker upon the gear changing mechanism as well, and it is quite likely that among the users of those machines the consensus of opinion would not favor the arrangement. With other drivers, however, the other method has already found favor, and, although so far as is known, no machines of American manufacture are arranged to compress at every stroke, still by the manipulation of the spark the same general result can be obtained, but with a lesser degree of retarding effect upon the car.

Certainly, as saving on the wear and tear of brake surfaces and as a convenience, some such arrangement should prove of great benefit as applied to any machine. As to the matter of interconnection, with this, as with the gear interlocker, the time of its need seems to be passing away Time was when the "fool proofing" devices on the machine were of almost as great importance as the organs of transmission and power, but with the simplification of design, and still more with the general education of the public to a point where frenzied and hysterical manipulation of everything within reach on the slightest provocation is no longer to be expected that importance is seemingly on the wane.

Moreover, as the motion which converts the motor into a brake would be learned by the novice almost as soon as the motion of applying the brake, and would soon become second nature; and as, were the engine so governed, the non-removal of the clutch at the time of the application of the brakes themselves could effect nothing more than the stopping of the motor at the same time that the car was stopped; there would seem to be no further need for the interconnection once such a device as would effect this were brought to perfection.

Pillows for the Tonneau.

The latest luxury for the tonneau is the pillow. Now when my lady goes out to ride in her motor car she reclines not only on the soft leather cushions with which the seats are upholstered, but also on the soft silk downy affairs which have hitherto been part of the cosey corner, but which now may be observed in the up to datest of motor cars.

MAKING MORE MISCHIEF

Tinkering with Carburetters a Prolific Source of it—Where Troubles More Likely Exist.

Some motorists have a fancy for taking the carburretter apart on the slightest provocation and are never satisfied that it is not the source of trouble unless they have it reduced to its lowest terms and promiscuously distributed over the scenery. But the carburretter is not the prolific source of trouble that some accuse it of being.

When an involuntary stop makes an investigation necessary and the bewildered one has carefully gone over every other possible cause—in his own estimation—and found them apparently in good working order, it is as well to think twice before dismantling the carburetter. It is a delicate piece of apparatus at best, and when taken to pieces by one whose understanding of its principles is none too good, its adjustment is liable to become deranged, thus adding to the original trouble.

Books and articles galore have been written as to just what to do when the motor refuses to start, and until experience has superseded such primary directions, it is not a bad idea to paste them in one's hat. They all differ more or less, but are of necessity so similar in their essential elements that a composite may readily be made. It would be something like the following: First, see if there is anything in the tank; if it contains plenty of gasolene, do not take it for granted that it is reaching the carburetter, but look for stoppages in the piping; see that air inlet on tank, if of gravity type, is not clogged; next inspect all parts of ignition system if a test of battery or other source of current reveals no defect there. For mysterious and puzzling aberrations the ignition doubtless takes the palm, so it is well to make this inspection a careful one. Valves and valve springs, whether of the automatic or mechanically operated type, are likewise prone to get out of adjustment, and it is remarkable what a slight derangement in them will give rise to an alarming decrease of power. These directions would seem to indicate a lengthy process of inspection, but it will be considerably less than that required to dismantle the carburetter and reassemble it properly, particularly when the latter proves not to be the root of the trouble.

That ingenious inhabitant of the Windy City, one Paul Picard, who suggested that all careless pedestrians who got in front of automobiles should be arrested, recently fell into the clutches of the law himself. He was, however, given the benefit of a Chicago magistrate's bargain day, and got off for $25 and a bond of $200 not to do it again, instead of being fined a "century"—the usual "price."

CASTING THE PISTON HEAD

Several Ways that Several Men Went About It and the Several Results.

A gas engine piston seems to be a very simple thing—that is, one of the trunk type that is a little more than twice as long as the diameter, says the American machinist. Who did the planning of the first ones that the foundry made does not appear to be on record, but they were made with the open end down. This was a very easy way to make them, as the pattern could be drawn out and the core stood down into a taper print that guided it right to place.

There is no reason to suppose that this method would ever have been changed if time had not revealed some defects arising from this way of doing things. If there was any dirt of any kind in the mold, of course it could always be found in the top end of the head as cast, and unfortunately this end was also the end that had to stand the heat and the effect of the explosion, and so could least afford to be defective in any way. It also seemed as if blow holes had a special liking for the space that should be occupied by spaces for the rings, when it was most desirable to have perfect sides on these same grooves. If the defects in these heads could have been always discovered before any work was done on them it would not have been quite so bad, but it was very seldom that any defect showed up until the grooves were being finished, and by that time nearly all the work was done on the head, and, worse than that, was the occurrence of dirt in the end of the head, as it might not show up until the engine was on the testing block and subjected to the heat.

Consideration of these things led the foundry foreman (he was not the one who was in charge when the first heads had been made) to change to way of making them. He did them the other way up. Instead of setting the core down in the mold he hung it up, and if there was any dirt in the head it was in the open end.

This was an improvement in many ways, but it still had some drawbacks, for while there were not so many bad heads in the machine shop, neither was it possible for a man to make one in the foundry in the same time that he could in the old way. In making them in the improved way it was necessary to use a three-part flask with one of the partings at each end of the head. This brought the core print in the cope, and it was necessary to tie the core up in it with wires. After it was made secure the cope was put onto the cheek, and then a man got down in under with a pair of calipers and proceeded to centre the core. This he did by pushing in one or other of the several wedges that went through loops in the various wires that were bedded into the print end of the core. After he had the core centred to his satisfaction, the cope and cheek were lifted onto the drag. If the core did not move during this last operation he might get a casting that was all right, but it was soon found that if the centring and wedging were not carefully done the core would be lopsided and would have to be thrown away. If there were any bad spots in the head they would usually be found at the open end, and they could often be gotten rid of by cutting back a little; but if they ran in too far to be cut out the head would have to be thrown away, for while they might not do any harm they were in the place in the head where they were the most conspicuous when the head was in use.

Owing to the fact that it was a job of considerable skill to centre and secure the core in a reasonable time and with certainty, the work on these heads had to be given to a good man, and good men come high; so, all things considered, the heads were an expensive job, and also one that was not liked by the men. Because of the known difficulty of centring the core accurately the machinists had to centre the heads by the core instead of by the outside; and so an extra amount of finish had to be on the pattern so as to have enough to allow them to true up. An extra eighth of an inch all around on a head as long as these means quite a lot of iron, and it takes an extra cut to get it off, or if it is taken off at one cut the feed will be finer but above all of these things was the necessity of getting good heads, and this method seemed to be the best way to get them. After a while there was a new man in charge of the foundry, and while he was a modest man and did not put up any claim of being smarter than his predecessors, he had different ideas on some things, and was willing to try to live up to his previous experiences and knowledge; and in trying to make things go as well as he could in his end of the establishment this head job was one of the things that struck him as having in it all the elements for improvement on some of the sizes.

After looking at the matter from various sides, a pattern was made that would do for two heads. A long piece was turned up that was the size of a head at each end, and a liberal space was left between them for core print. This pattern was parted lengthways through the centre. The core box was made so as to make the core for both heads in one piece.

With this arrangement it was thought that two heads could be molded almost as quickly as one, and much more quickly than one could be in the old way. After a few heads had been made it was found that the new way had some drawbacks. In spite of a long print between the two heads, it was found that the core would rise, and it was apt to rise more on one end than on the other, although the mold was poured from both ends at the same time. To counteract the tendency to tip the print was made longer, and chaplets were used to hold the core down so as to offset the desire it had to float.

This being a new way to do this job, it was watched closely for a time, and everything seemed to be all right and so easy that it seemed as though almost any molder could be sure of good heads, and, as is usual, the attention was shifted to some other part of the foundry work.

About this time the man in the machine shop thought his method of centring the heads could be bettered, and he changed it so that he was sure when he got through that they were really centred by the core; and about the time he had his changes finished it was found that more heads were being thrown out because of the core not being centred properly than was pleasant. In making the pattern for the new way of doing heads the finish had been reduced so that it was not much more than it would have been if it had not been necessary to pay any attention to the core. This had been done because the boss molder said that it was as much as he would need, but it did look almost as though he had been mistaken; however, he did not lose his nerve and give up, but he had a little gauge made so that the molder could try it and make sure he had the core clear down in the print before putting on the cope. He also had one made so that the ends of the core could be tried to see that it was not nearer to one end than the other. By these means he has succeeded in getting good heads without having excessive finish on them.

Care of the Brasses.

When a car is brought in from the road it is a very good plan to dust off the brass parts and coat them with polish, leaving it there until the machine is about to go out again, thus keeping all water from coming into contact with the bright surfaces and tending to tarnish them, and also protecting them from any moisture which may be in the air, and from the action of any vapors which may be injurious to their appearance. If the car is to be taken out on a rainy day, it is well to leave the coating in place and not to attempt to polish the parts as the action of the rain is apt to tarnish them. If liquid polish is used, it cannot be left on in this way as it is likely to cut the finish and do a good deal of harm, but with most of the preparations which are put up in the form of paste, and with plain tallow, the coating may be left on indefinitely without doing any injury whatever.

Why the Muffler Cut-out!

As the result of experience gained in the recent tourist trophy contest held in the Isle of Man, one observer predicts that muffler cut outs, or as they are termed by the Britisher, "exhaust ports," will figure more prominently on 1906 models than they have on their predecessors. Among the advantages cited for this feature, which has been discarded on American cars so long since that new recruits to the sport do not know what it is, the observer in question mentions that "it is useful to restrain the suicidal tendencies of dogs when the horn is ineffective."

MAKING THE ENGINE ELASTIC

Some Novel Ideas to that End that are in Evidence in the Bruckert Motor.

Lack of constant torque or pull was a drawback recognized at an early stage in the use of the single cylinder engine for automobile purposes, and two, three, four and six cylinders were the steps taken in bringing about the solution of the problem. Two

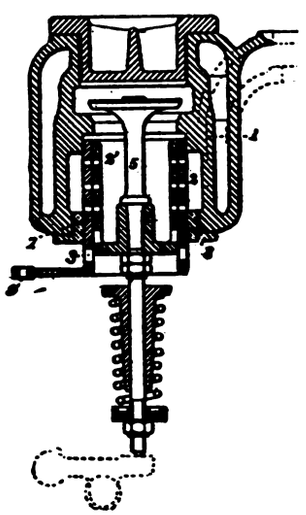

Fig. 1.

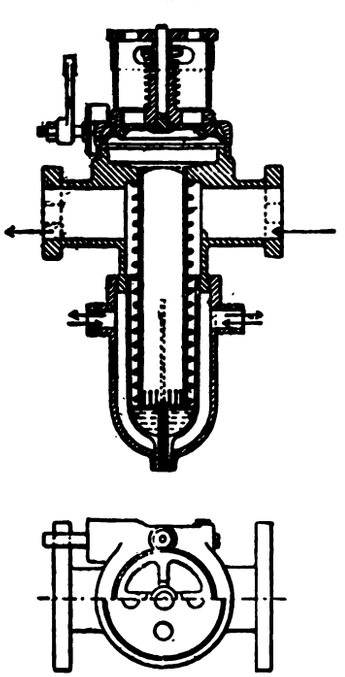

Fig 4.

were better than a single cylinder and three were better still, but it was not until the four cylinder motor was settled upon that smooth easy running, free from vibration, and with a constant pull on the crank shaft was obtained.

There are many who believe that this result is not attainable short of the employment of six cylinders, but going beyond four has been found to mean added complication

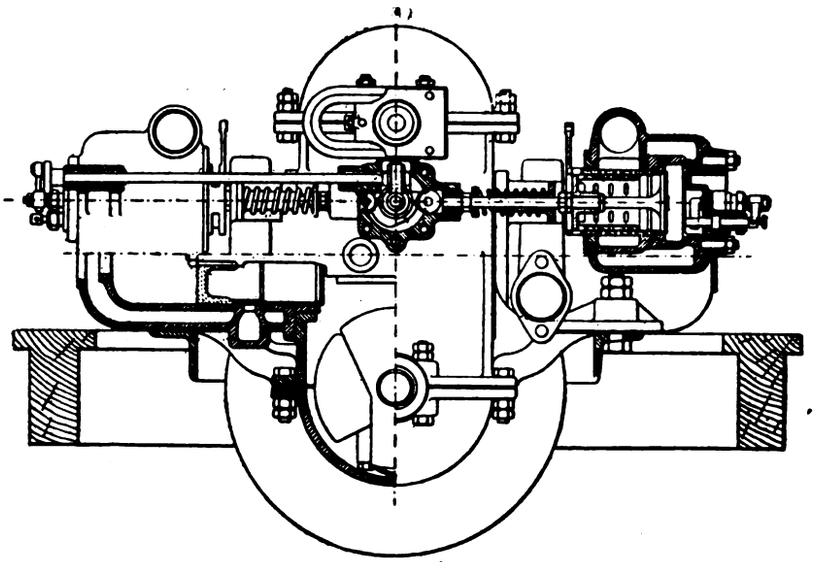

Fig. 2.

out of proportion to the benefit to be gained, so that the four cylinder motor is now the accepted standard. But despite this there are many who have looked for a solution of the problem in directions other than in the multiplication of the number of cylinders. Many more or less ingenious devices have resulted from these attempts and in some instances have been attended with fairly satisfactory results, notably by insuring a constant compression at whatever speed the engine may be running. In the majority of such cases, however, it has only been obtained at the expense of added complication or increased weight-items of greater importance than the slightly added flexibility brought about.

Nevertheless the problem is interesting in that its final solution augurs for the future an internal combustion motor having an amount of elasticity equal to that of the steam engine, so that the different devices introduced for overcoming the drawbacks of the present type are well worth consideration.

In the Bruckert motor, a French product, for instance, the expansion principle has been introduced with apparently satisfactory results, the makers claiming that constant daily use extending over a period of a year has shown their motor to be possessed of a degree of elasticity that permits of the elimination of the change speed gear. But then, of course, this is only one of many that have put forth identical claims to supremacy without in the end having come into general use.

However there are several novel features on the Bruckert that make it particularly interesting. The basic principle of its operation is the maintenance of a constant quantity of gas. The mixture admitted during

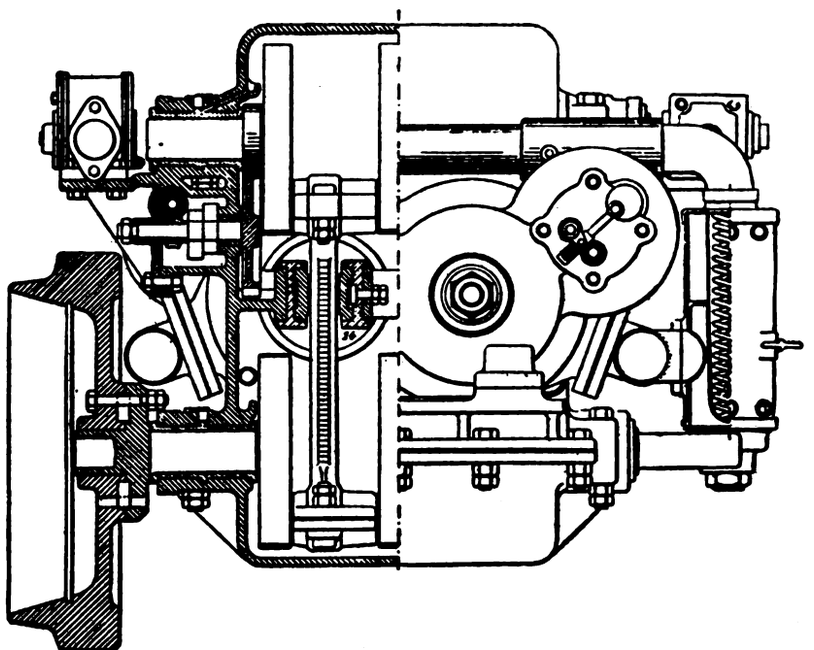

Fig. 3.

Digitized by Google

the first part of the lift is very weak and when the valve is fully opened a rich mixture is then admitted and is compressed in the combustion chamber and exploded. The weak mixture then burns with an expansive action. It is evident therefore that the valve mechanism must admit the rich and weak gases in variable proportions according to the speed of the engine and the load, and this is done in a very ingenious manner, which may be followed by a reference to the drawings. Figure 1 shows a sectional elevation of the induction valve. Into the casting 1 which forms the body is screwed the ring 8 which receives a form of rotary throttle 2, actuated by the lever 9. This throttle has a number of ports coinciding with similar openings in the piston fixed to the valve stem 5. When the valve is actuated by the cam the piston slides up and down, thus admitting the required quantity of explosive mixture from the chamber 2 which is in direct communication with the carbureter. The lower part of the piston covers and uncovers the ports 3 communicating with the atmosphere. The proportions of explosive mixture and air are regulated from the maximum in one case to the minimum in the other by the lever 9. It will thus be seen that by varying the quantity of explosive gas, which naturally has not time to mix with the air, the force of the explosion also varies, and when running under a light load the charge has an expansive action. The principle is not new, since there is something similar to it in a Swedish motor, which runs under constant compression by maintaining the air and gas separate in the cylinder, but it is worked out in a manner somewhat different from that of the Bruckert engine and should apparently be more effective.

Like its induction valves the Bruckert engine is also of novel design. The cylinders are horizontal and opposed, but the pistons do not drive directly on the crankshaft. Instead there is a vertical shaft running in guides, the upper part revolving on a crank with bearings in the engine chamber and the lower extremity on the crank shaft, the throw in both cases being the same. This shaft is held between rollers on the ends of the pistons, so that as the vertical shaft is pushed back and forth it rotates around the cranks. If required, the quadrangular shaft, as it is termed on account of its travel, may drive two crankshafts. It is further claimed for this method of converting the reciprocating into rotating motion that it obviates the sidewise strain or thrust on the cylinder from the ordinary form of crank shaft, and the transmission effort is reduced to a minimum. Figure 2 which is a transverse section illustrates the arrangement of the cylinders and the valve mechanism, and the longitudinal section, figure 3, makes clear the method of transmission employed with the vertical shaft running between the guides 14. Figure 4 gives a section of the carbureter with automatic provision for admitting fuel and air, the gas circulating around a spiral chamber where it is warmed by the exhaust when necessary.

Causes of Crystallization.

Generally accepted theories of the cause of crystallization will have to undergo a revision if the recent discovery of Sir Purcell Taylor proves to be of the degree of importance of which it now holds forth promise. He has made it plain that the agencies which cause the formation of crystals are twofold.

In the first place, it was supposed that crystals were only formed when liquids were at rest and in a state of perfect quiet; but it has now been discovered that crystals are the result of a rhythmic motion taking place among the ultimate molecules of the substance, and that crystals may be formed under these circumstances in liquids, solids and gases.

This discovery explains the crystallization of metal in engineering structures, and which frequently results in the breaking of bridges, locomotive axles and the tunnel and propeller shafts of steamers. In the latter connection it is curious to note that the same discoverer should have been the inventor, some twenty-five years ago, of the built up crank shaft for steamers, which has almost entirely done away with the constant breakage at that point, and should now have discovered indirectly the cause of the continual breakage of propeller shafting. The discovery points also to the existence of a fourth state of matter beyond that of gas.

Automobile axles are but replicas of those on locomotives, although of a totally different design, and are subject to strains entirely out of proportion to their size as compared to those of their vastly heavier compere, which always runs on a smooth way, while the crank and propeller shafts are but miniature reproductions of those used on the largest steamers. Weight and size considered, add to which engine and rear axle are not in the same plane, so that the shaft works at an angle, and it will be evident that these also are subjected to proportionately greater strains.

De Dion's Electrical Governor.

Considerable difference of opinion exists as to the necessity for governing the motor of the car, and as things are at present, there are probably quite a majority of designers on the pro side of the question, but from time to time there are defections from the ranks. In addition to that old standby—centrifugal force, which according to the ideas of the builder is caused to act upon the throttle or ignition; air and water pressure are also relied upon for this purpose.

A patent, however, has recently been granted to the makers of the De Dion cars for a purely electrical system of governing. As already referred to, more or less resort has been made to retarding the time of ignition by means of the customary centrifugal governor, which may be termed a mechanically actuated electrical governor, but in the system under consideration the current itself supplies the moving force. The principle is a familiar one in electrical engineering usually being incorporated in a number of safety and overload devices in connection with generators such as circuit breakers and voltage regulators.

The source of current is a continuous current magneto primarily installed for ignition. As this is geared direct to the motor or otherwise connected so that it maintains a rate of speed relative to that of the motor, the voltage of its output will vary as the speed changes. Only a part of the current generated by the magneto is necessary for ignition purposes, the remainder acting on an electromagnetic regulator of the usual solenoid and plunger type, connected in shunt across the ignition mains. The soft iron core or plunger of the solenoid is controlled by a spring against the pull of which the current must act. Its motion is in turn transmitted to a device for advancing or retarding the ignition, though it may also be employed to act upon the throttle or as an exhaust valve lifter.

It is obvious that the apparatus being once adjusted for a voltage corresponding to a definite speed, the motor cannot exceed this speed because as the voltage tends to increase, the regulator begins to act and tends to prevent the speed rising. In order that the regulator may be adjusted for different speeds, varying the tension of the counteracting spring may be resorted to, or the solenoid may be provided with several independent windings, both methods being covered by the patent. The latter is naturally the more positive and has the further advantage of being capable of control from a distance as from the steering wheel. This is effected by the use of a commutator switch enabling the current to be diverted through any number of the windings or all. The strength of the pull or attraction exerted by each of these windings is of course, accurately calculated to effect a corresponding movement of the device controlling the ignition or throttle as the case may be. For instance, with the speed allowed by sending the current through the first section of the coil represented by one, the retardation and accompanying drop in speed may be one-half, one-third and one-quarter or in any other gradation of steps desired.

For Illumination of Closed Cars

One of the most recent developments that owes its inception to the widespread use of inclosed bodies is the provision of an extra accumulator for lighting the interior. In its latest bulletin the National Battery Co., of Buffalo, N. Y., calls attention to a special set of their "Unit" accumulators, which they are putting out especially for this purpose. It is composed of four cells in hard rubber containing jars, specially adapted to withstand breakage, a hard rubber bridge in the bottom being provided with a soft rubber lip that acts as a cushion on which the plates rest. They are intended for use with 8 volt lamps.

ANNOUNCEMENT

The New Model 1906

Rainier

30-35 H. P.

has arrived. Note specifications below, then inspect it and try it. Experts who know Auto-cars from A to Z will be forced to admit that in beauty, workmanship, enduring strength and every other requisite of a perfect touring car, this magnificent new Rainier is THE American Automobile.

Engine.	30-35 H. P., 4 cylinders, water cooled.
Ignition.	Sims-Bosch Magneto—make and break spark.
Transmission.	Sliding train. 3 speeds forward and one reverse.
Rear Axle.	Bevel gear drive, clutch driven hub. Ball bearings.
Front Axle.	I Beam section. Ball bearings.
Frame.	Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.
Wheel Base.	104 inches.
Wheels.	Imperial whalebone, grade A 2nd growth hickory.
Tires.	Continental 34 x 4.
Valves.	Mechanically operated, inlet and exhaust interchangeable.
Carburetter.	Float feed, requiring no adjustment.
Brakes.	Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
Body.	Full aluminum, double side entrance.
Equipment.	Two head lights, 2 side lights, 1 rear light, 1 horn.

Price, $4,000.

The 22-28 H. P. will be continued as heretofore, without any changes.

4 cylinder—98 inch wheel base—La Coste coil. French battery. Continental Tires. Aluminum side door body.

Price, $3,500.

BOTH MODELS GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

The world's broadest and most liberal automobile guarantee. Landaulet bodies for immediate delivery. Limousines for October and November delivery.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Boston Agents: MORRISON-TYLER MOTOR CO.

Good Agents wanted in unassigned territory.

MERCEDES CARBURETTER

Famous German Concern Makes a Significant Change—How the New Device Operates

One of the most notable features of the 1906 model of the Mercedes cars which has recently been completed will be found in the carburetter, and the principles upon which it is based are indicative of the marked effect that French initiative has on the design of the German car. It will be recalled that French experimenters have been studying the use of the multiple jet and multiple air inlet type for some time past, and many of the leading builders in that country have placed patents to their credit on the particular forms evolved by them, principally since the opening of the present year. It is accordingly not surprising that the carburetter of the new 70 horsepower Mercedes should be of this type.

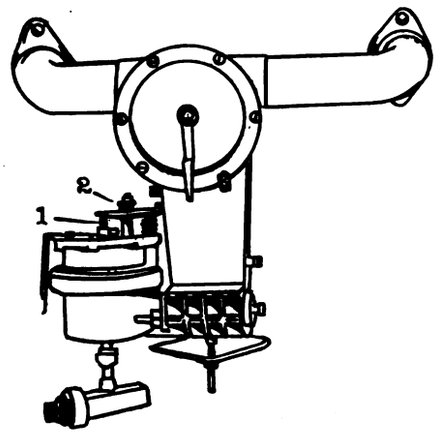

Fig. 1.

The carburetter complete, with its branched feed pipe ready to be fitted to the engine, is pictured in Fig. 1. The usual float feed chamber will be recognized by its form at the left hand side, but in connection with this a somewhat novel departure has been made. Protruding above the centre of this chamber appears the end of the usual central needle for automatically regulating the flow of liquid. This is indicated by No. 1. Just to the right of it will be noticed another needle somewhat similar in form, which is normally held up by a weak helical spring; this controls the flow of fuel to the jets further to the right and lower down. Between these two needles there is a pillar supporting a cam disk, 2, which simultaneously presses both needles down upon their seats. This disk is connected to a small lever on the dashboard, so that the flow of fuel to and from the carburetter is entirely under the control of the driver.

The four jets are so arranged as to receive an equal feed of liquid, but the size and number of outlets in each vary considerably. For instance, the first jet, or the one nearest the float feed chamber, is perforated by but two small holes, while the last, or fourth jet, at the right hand end of the group, is pierced by four openings of much greater diameter. The two intermediate jets have the same number and size openings, two in each case. The upper ends of the jets are entirely closed, the holes being drilled in the walls close to the top so that the fuel is sprayed out radially.

The mixing chamber, which is directly above the jets, is solid with the branched induction pipe, and its upper end is widened and made circular in order to house the rotary throttle valve. It is divided vertically into four distinct compartments, one above each jet, and each compartment terminates at its upper extremity in the cylindrical throttle valve casing. The entire mixing chamber is water jacketed, fed by pipes connected at the unions shown at 5 and 6, Fig. 2, and the four compartments are entirely open to the atmosphere beneath, as shown in both illustrations. At their upper ends the four compartments form ports 7, 8, 9 and 10, varying very greatly in size, and which are covered and uncovered by the rocking inner member of the throttle valve, a separate view of which, No. 11, is given at the right of Fig. 2. The extreme left hand opening, No. 7, which corresponds to the smallest jet of the four, is but a mere slit, the others increasing in size by about 50 per cent until the largest, likewise corresponding to the largest jet, is reached. Surrounding the smallest jet the mixing passage is small in section, but around the other three jets the chambers are of considerable area. A powerful injective action is accordingly obtained when the first and smallest jet is in operation alone, and ample carburetion can thus be maintained even though the amount of air admitted be reduced to the minimum.

In action the operation of the throttle valve brings the curiously shaped port, 12, of the moving member, 11, around to the left, so that it communicates with the first, or slit-like, port at the left of the series of openings corresponding to the jets beneath before any of the others are opened. With the engine running light, the required volume of mixture can then be obtained to a nicety by altering the relative position of the port and the slit, this being accomplished from the steering wheel by means of a lever connected to the crank operating the throttle valve and shown hanging down from the centre of the casing in Fig. 1. To obtain more power, the valve is moved further to the left, when the V shaped edge, 13, of the moving member begins to uncover the largest port, 10, at the same time as the port, 12, gradually reduces the feed through the slit or first port at the left of the series. Further movement opens the large port fully, and then uncovers the remaining ports, 9 and 8, consecutively. The jets, one after the other, are thus successively brought into action, until whereas at first only the smallest was in operation, all three large jets, 8, 9 and 10, are supplying fuel to the engine. All the air required for the mixture enters at the open ends of the mixing chambers, coming up around the metal dish-like fitting placed beneath the trunk from which the jets spring.

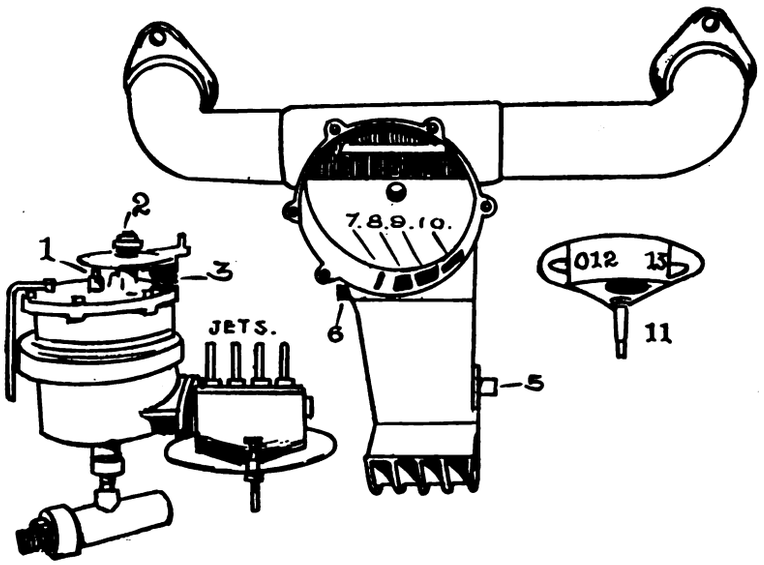

Fig. 2.

Care in the Paint Shop.

In the paint shop, as in the other factory departments, the much preached but little practised rule, "A place for everything, and everything in its place," should be inviolate. Sponges and chamois should be kept in dry places. Drop cloths should be numbered and size given in each corner. Shellac brushes should be washed after being used, and kept in a drawer or box, and if needed you will simply have to place them in alcohol or shellac a day before. New or partly used brushes should never be placed in water; the only proper way to keep them in good condition for any length of time is to place them in a large pot or keg of mixed color, just enough paint so that the bristles will not touch the bottom. Varnish, enameling and staining brushes are best kept clean and straight by suspending them in oil, either with the patent brush holder or by boring holes through the handle and held with a wire.

How the Sultan Was Converted.

How the Sultan was converted to automobiling makes a diverting tale, and shows that this more or less well known individual adds to his many other bizarre qualities that of the canny Scot. He was willing to take a car as a present; he would not look a gift automobile in the gasolene tank, but paying for one was another story entirely—that was where his enthusiasm dwindled to the vanishing point. The Sultan is always reported to have had the greatest horror of automobiles of every kind.

According to a cable from Paris, the Khedive of Egypt is responsible for the conversion. The latter dignitary while recently in the French capital purchased two high powered, luxurious touring cars, and the manufacturer promised him a third as a gift if he could induce the Sultan to become the purchaser of a car of the same make. Some time after his return the Khedive wired back that he was unsuccessful in persuading his Turkish highness to buy a car, but that he would take one as a gift. The manufacturer cabled his acceptance of the arrangement, considering it as first rate advertising. Before he could be induced to enter the car, however, the ruler of all the Turks had every part of the car dismantled and its use explained to him, with a view to proving its solidity as well as the absence of anarchistic or other mysterious and noxious devices.

"Seventy miles in 3 hours 42 minutes—from Springfield (Ill.) to Peoria (Ill.)—raced the big racing autos of Pete Weast and Alderman Simmons and Simmons won by the bare margin of two minutes." This, in itself quite enough, is the interesting dispatch from Peoria of a "remarkable" feat.

The Undertaker's Little Joke.

Many are the queer advertising methods employed, but the most incongruous has been perpetrated by a Maine undertaker. To each automobile owner whose name he was able to secure he sent the following card, with the admonition that it be tacked on the dash:

"Take position on seat, turn on steam, open gauge wide. See that safety valve is set at 1,000 pounds and then notify (over)

The other side read:

"J. A. Ferris & Sons, undertakers and manufacturers of coffins and caskets. This side up!"

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau Street, New York.

PENNSYLVANIA PRC CLINCHER

There are no perfect Motor-Cars, nor any perfect tires—as yet.

But if you have a car which you consider almost perfect perhaps you would like a tire fit to associate with it.

The Week's Patents.

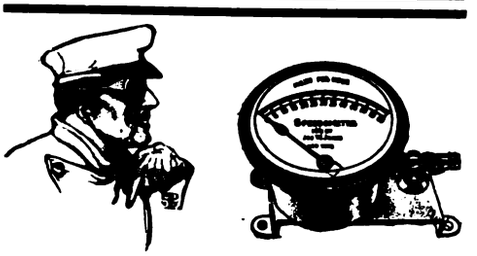
801,730. Lubricator. Herbert M. Lofton, Atlanta, Ga., Assignor to National Investment Company, Savannah, Ga., a Corporation of Georgia. Filed October 29, 1904. Serial No. 230,503.

Claim.—1. The combination with the drive-shaft, and the axle shafts geared together, of the casing inclosing said parts and provided with lateral tubular portions encircling the axle-shafts and with inner bearings for the said axle-shafts, the outer bearings for the axle-shafts provided at their lower sides with reservoirs for the oil, and with ports leading from the bearings to said reservoirs, sleeves encircling the axle-shafts and extending between the inner bearings and forming conduits through which the oil may pass from the inner bearings to the outer bearings, return-channels for the oil being provided between the reservoirs at the out bearings and the casing, the inner and outer bearings for the drive-shaft, a sleeve extending between said bearings for the drive-shaft, a sleeve extending between said bearings, and a return-channel between the outer and inner bearings for the return of the oil supplied to the outer bearings, substantially as set forth.

801835. Ball-Bearing. Rudolph H. Apelt, Roxbury, Mass. Filed February 25, 1905. Serial No. 247,318.

Claim.—1. In a ball-bearing, the combination, with an outer bush provided with ball-races at its end portions, of two inner sleeves provided with ball-races at their outer end portions and screw-threaded portions at their adjacent ends which engage with each other said sleeves having also central holes provided with serrations, balls arranged between the opposed ball-races of the said sleeves and the said bush, and a shaft which engages with the said serrated holes of the sleeves.

801,850. Electrical Distributer for Gas-Engines. Lee S. Chadwick, Ridley Park, Pa. Filed March 26, 1903. Serial No. 149,637.



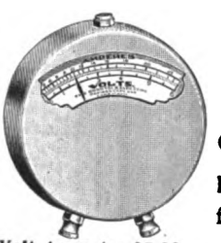
Claim.—1. In an electrical distributer for gas-engines, in combination, a distributer-body having a periphery comprising a contact-segment of conducting material connected with one pole of the circuit, a segment of conducting material beyond the contact-segment and insulated from the circuit, a narrow strip of insulation between the segments of less width than the width of the contact-face of the brush, the distance between the contacting ends of the brushes being greater than the length of either of said segments, thereby presenting a substantially continuous periphery of conducting material, while excluding a path for the current from one brush to another while either brush is simultaneously in contact with the contact-segment and the adjacent segment.

801,852. Vehicle-Wheel. Alfred Cousen, Detroit, Mich. Filed April 4, 1904. Serial No. 201,608.

Claim.—1. In a wheel, the combination with an inner and an outer rim, of springs forming the sole connection between said rims and consisting of a flat strip of spring metal bent to form S-shaped portions to resist the radial movement of one rim toward the other and intermediate portions each composed of a flat strip of spring metal having double bends intermediate its ends and connecting the inner end of one S-shaped portion with the outer end of the next S-shaped portion, and means for securing the springs to the inner and outer rims at the inner and outer ends of the S-shaped portions.

801,898. Electric Power-Transmission Device. Herbert McNulta, Anaconda, Mont. Filed December 10, 1904. Serial No. 236,369.

Claim.—1. A motor-vehicle consisting of the combinations of a prime mover, run-



ACCURACY!

The accuracy of the Speedometer is attained by the mechanically perfect application of an absolutely unchangeable law. The standard of perfection of this instrument will never be equaled by devices based on theories, the practical application of which is so impossible that they were discarded in the development of the Jones Speedometer. Do you know of our Protection Tag? Write for information.

ning at approximately constant speed, an alternating-current generator, one element of which is driven by said prime mover mechanically, a shaft to be driven, carrying the other element of said generator, an alternating-current motor whose one element is fixed to said shaft, and whose other element is stationary, and a transformer electrically connected between said generator and said motor, for varying the electromotive force supplied by said generator to said motor.

801,927. Fuel-Mixing Device for Gas-Engines. Harry J. Smith, Buffalo, N. Y., Assignor to the Alberger Company, Buffalo, N. Y. Filed October 11, 1901. Serial No. 78,342.

Claim.—1. A fuel-mixing device, comprising an air-supply, a gas-supply, two cooperating volume-controlling members, one of which is movable-relatively to the other and one of which has a port, and a separating member arranged between the air-supply and the gas-supply and entering said port and having its edge flush with the joint between the last-named members, said separating member and the cooperating volume-controlling member being movable one relatively to the other for varying the proportion of air and gas, substantially as set forth.

801,934. Universal Joint. George W. Toney, Waltham, Mass., Assignor to Frank Burgess, Quincy, Mass. Filed February 27, 1905. Serial No. 247,407.

Claim.—1. A universal joint comprising in its construction a ball provided in its periphery with an annular groove, a yoke consisting of an annular ring portion located in said groove and a flat shank portion, said shank portion divided in two parts, and a sleeve fast to said yoke.

802,005. Metallic Tread for Resilient Tires. Wallace C. Lyon, Hyattsville, Md. Filed December 16, 1904. Serial No. 237,173.

Claim.—1. A tire-protecting device comprising a series of interchangeable links, each having a hook at one end and a pin at the opposite end with an indenture adjacent to said pin, the inner face of each link being concaved, said links adapted to be interlocked and form an endless chain, as set forth.

802,009. Spring-Wheel for Vehicles. Digby C. Master. Helouan, near Cairo, Egypt. Filed February 9, 1905. Serial No. 244,935.

Claim.—In a spring-wheel for a vehicle the combination of a hub, a number of sleeves radiating from the hub, a rim, and flexible spring-spokes bent at the outer end which can move slightly in the rim and placed back to back in pairs at the inner ends which fit into the sleeves.

802,029. Die for Forming Radiator-Disks. Benjamin Briscoe, Detroit, Mich. Filed October 17, 1904. Serial No. 228,868.

Claim.—1. The combination with cooperating punch and die members for cutting a sheet-metal disk, of a stationary punch arranged centrally within the die member having its upper end of pyramidal form, with its apex below the plane of the cutting edge of said die, said movable punch being provided with a recess for receiving said stationary punch, a member complementary in form to said movable punch and surrounding said stationary punch and movable thereon, and a yielding support for said member.

802,038. Carbureter for Hydrocarbon-Engines. Franklin W. Hagar, Nashville, Tenn. Filed April 19, 1904. Serial No. 203,863.

Claim.—1. In a carbureter, a mixing-chamber having an open end, a main air-inlet port, means for controlling the latter, a suction-chamber arranged within the end of the mixing-chamber, contracting the area of the latter, and having ports discharging transversely of the contracted portion thereof, a sleeve disposed axially of the mixing-chamber with its bore communicating at one end with the suction-chamber and at its opposite end with the exterior of the carbureter, a valve for controlling the communication between said bore and the suction-chamber, and a feed-duct in communication with the suction-chamber, substantially as described.

802,050. Elastic Wheel. Carl M. P. G. Lungwitz, Cassel, Germany. Filed September 3, 1904. Serial No. 223,193.

Claim.—As an article of manufacture, a wheel having a felly consisting of two concentric rings arranged with an interposed space, ring-like disks arranged on opposite sides of the wheel, said disks being secured to the outermost ring and having portions arranged on opposite sides of the innermost ring and bridging said space between the two rings, a floating ring arranged in said space having its opposite edges coacting with said disks, whereby it is prevented from lateral displacement, and springs interposed between the felly-rings and said floating ring substantially as described.

802,118. Vehicle-Wheel. Gustav A. Schoche, Dresden, Germany. Filed June 26, 1905. Serial No. 266,987.

Claim.—1. A vehicle-wheel comprising in combination with the axle and ball-bearings, the hub-sleeve, a trough-like annular extension on either end of said sleeve with alternately-spaced perforations for the spokes, a two-part, slantingly-bored clamping-ring in said hub-sleeve extensions, means to temporarily clamp these two parts together, a wedge-ring in said hub-sleeve extension, flattened seat portions on said wedge-ring, means for tightening said wedge-ring within said extension, and shoes or sockets on the felly to receive the outer ends of the spokes, substantially as described.

802,125. Valve Gear for Explosive Engines. Ernest R. Uhlin, McDonald, Pa., assignor of one-half to Barrett D. Tillinghast, McDonald, Pa. Filed December 15, 1903. Serial No. 185,251.

Claim—1. The combination, with an explosive engine, of means for controlling the admission of an explosive mixture and the escape of spent gases to and from the cylinder, comprising a casing in communication with the cylinder, having a gas inlet port, an air inlet port and an exhaust port, a single tubular valve closed at its outer end and located within the casing controlling said ports and the communication between the casing and cylinder, and means for operating the valve.

802,146. Changeable Speed Gearing. Oliver W. Johnson, Cleveland, Ohio. Filed June 29, 1904. Serial No .214,666.

Claim—1. In changeable speed gearing, the combination of a power driven shaft, a second shaft coaxial with the power driven shaft and adapted to have the power taken therefrom for operating the machine or part to be driven, a series of power transmitting shafts grouped about the power driven shaft, speed gear trains between the power driven shaft and the series of power transmitting shafts, a master wheel connected with the aforementioned second shaft for rotation therewith, gear wheels loose upon the respective power transmitting shafts and in mesh with the master wheel, and means for connecting the loose gear wheels with their supporting shafts to impart the required speed to the master wheel, substantially as described.

802,159. Apparatus for Molding Rubber Tires and the Like. John L. G. Dykes, Chicago, Ill. Filed September 6, 1904. Serial No. 223,473.

Claim—1. In an apparatus for molding rubber tires and the like, the combination with a mold having a laterally apertured delivery nozzle and means for forcing plastic material therethrough, of means for guiding and directing a covering strip of non-plastic material drawn through said aperture by frictional contact with the surface of said plastic material as the latter is expressed through said delivery nozzle, substantially as described.

802,175. Clutch and Changeable Speed and Reversing Gear Mechanism. Frederic G. Seeley and Leopold Tolch, London, England. Filed May 2, 1904. Serial No. 206,095.

Claim—1. In an apparatus of the class described, a stationary casing, a driving shaft passing into one end thereof, a driven shaft passing into the other end thereof, a gear box loosely mounted on the inner ends of said shafts, a gear wheel secured to the inner end of each of said shafts within the said box, other gearing in said box and supported thereby and by which the last named wheels are connected, an annular clutch member secured to said casing at the end through which the driven shaft passes, a circular clutch member secured to the driven shaft within said casing, an annular member mounted between said clutch members and adapted to operate in connection with both, and means for moving the annular brake member toward and from the gear box and securing it thereto, substantially as shown and described.

802,216. Carburetter for Hydrocarbon Engines. John H. Johnston, Paris, France. Filed September 14, 1903. Serial No. 173,102.

Claim—1. In a carburetter for explosion motors, means for regulating each of the fluids of the combustible mixture, operated directly by the suction of the motor, each means comprising vessels communicating with each other and containing a mass of mercury, a communication between one of the said vessels and the suction tube, and a passage for one of the said fluids regulated by the displacement of the mercury which oscillates in the vessel in concordance with the greater or less suction of the motor.

802,259. Changeable Gearing. John M. Billingsley, Billingsley, Tenn. Filed December 18, 1903. Serial No. 185,653.

Claim—1. A variable speed mechanism, comprising a driving shaft having oppositely disposed grooves arranged therein throughout a portion of its length, a driven shaft having grooves arranged therein throughout a portion of its length, gear wheels loosely mounted upon each shaft, and means operating simultaneously within said grooves for interchangeably keying oppositely disposed wheels to their respective shafts.

802,299. Universal Joint. Vladimir Lorenc and Victor Lorenc, Berlin, Germany. Filed November 30, 1904. Serial No. 234,927.

Claim—1. In a universal joint, the combination, with a movable element having bifurcated ends, of a ball pin arranged to be embraced by the bifurcated ends and provided with ribs, and means for adjusting said ribs radially of the ball pin.

THE STEEL BALL CO., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6 days endurance and economy run at Long Branch. In a run of 3202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of this we fully realize and its help in getting this record for our FRAYER-MILLER car.

Yours truly,
THE OSCAR LEAR AUTOMOBILE CO.

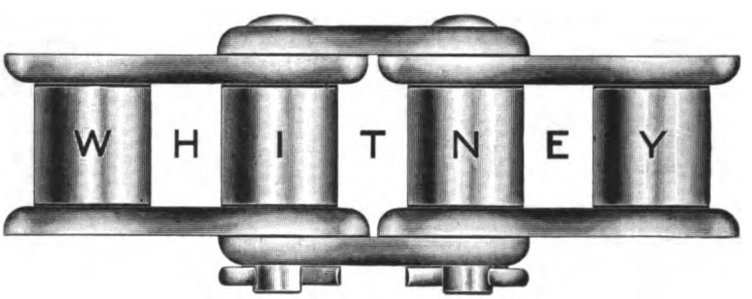
Watch the efficient double chain drive. It gives greater strength with less weight and has many other advantages.

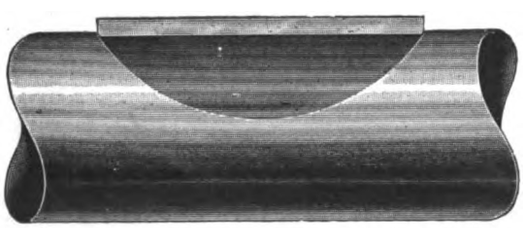
The New 1906 Model "Whitney" Chains on certain cars with double chain drive are absolutely noiseless and are breaking all previous records for efficiency.

If spockets are correct the results will surprise you.

No Noise



No Trouble



1906 Model "Whitney" Detachable Roller Chains—Patented.

"Whitney" Standards for dimensions of Roller Chains have been adopted by most of the Leading American Car Builders and we are pleased to announce they have at last been accepted by other Chain Manufacturers at home and abroad. For years we have recommended our efficient and uniform Standards for pitch sizes and diameters of rolls, and although these Standards have heretofore been strongly opposed by certain Chain and Automobile Makers, we believe the ideal condition is now near at hand. For 1906 Model Cars of all styles and weights, six sizes of chain can take the place of over thirty sizes used in the past.

New 1 Inch Pitch

There are reasons why

MORGAN & WRIGHT TIRES ARE GOOD TIRES

Reason 4

RESILIENCY.

¶ First, last and all the time an auto tire must be resilient—springy—full of life.

¶ A good tire must, together with its toughness, strength and proper fabric-construction, be sufficiently pliable to give comfort to its user over all kinds of roads.

☞ **Two causes tend to produce resiliency in Morgan & Wright tires: an uncommon amount of pure rubber stock and a fine element of elasticity that is contributed by our special fabric-construction.**

¶ Users of these tires say they are a "happy medium" between tires that are two hard for comfort and those that are too soft for service.

¶ They are good tires because they meet every requirement of good tires.

POPE Waverley ELECTRIC AUTOMOBILES

FALL AND WINTER PROFITS INCREASED.

AGENTS who handle both gasoline and electric cars find the fall and winter season, when trade is quiet in gasoline automobiles, just the season for pushing the sale of Waverley Electrics, especially the Station Wagons and Coupe Top Chelseas—the electric business supplements so nicely the gasoline trade that the wise ones reap the profit and keep their force busy throughout the year instead of passing through a dull season, when the demand for gasoline cars slackens.

We have the convertible Coupe-Top Chelsea ready for delivery. The top removed makes it a stylish Electric runabout.

Catalogues on request.

DON'T EXPERIMENT
Just Sell
THE FORD

Mr. Agent:—Over 2,000 Automobile buyers decided during the past season not to experiment. They all bought "Fords." It is even more important for the retailer to *sell* a car of known merit than it is for the purchaser to *buy* one. The buyer only loses his *money*, but the agent who sells a car not up to standard loses both *prestige* and *reputation.*

The success of the Ford Motor Co. is built on the success of the Ford Cars, and you know how great our success has been. Remember that people like to do business with successful firms, and a *car with a reputation is easier to sell than an unknown.*

You know the general rush to the Ford exhibit at the shows, and how they all ask, "*What has Ford this year?*" plainly indicating that automobile men look to Henry Ford for new ideas and originality of design.

We have a surprise or two up our sleeve this year—particulars about October 15th—nothing before, except that there is certainly good business ahead for the Ford agent in 1906, and it might be well to write us and see if we can give you the proposition and the territory you require.

TALKIN' OF THE COST OF UP-KEEP

The Royal Tourist cars are run by their owners at less repair expense than any other motor cars built. You simply do not have repairs. Ask an owner of a Royal how much it costs him to maintain it. Then compare his figures with any other car, big or little touring car or runabout. Royal owners everywhere. Ask one.

Why is this? Every part is made and put together with proper care. Money is freely spent for best materials. That's why!

That is also the reason why we were able to roll our car over in the Vanderbilt Trials and then finish among the first.

The Expected Revolution Has Come!

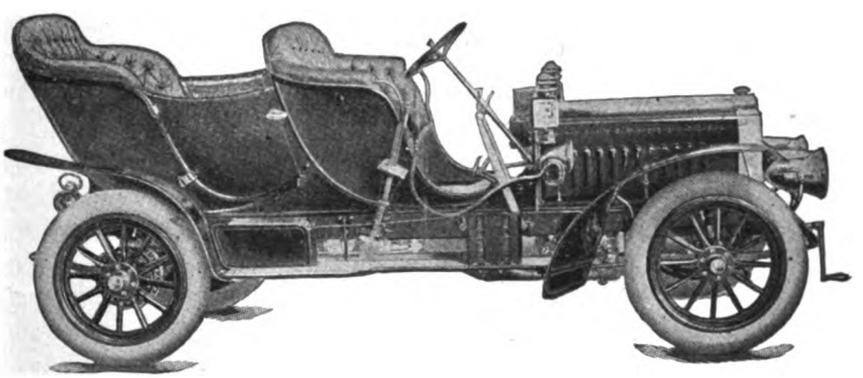
If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found the only good reason why you should *not* buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the *two* cycle two cylinder Elmore engine.

Understand—the *two* cycle two cylinder Elmore engine produces *two impulses every time the fly-wheel turns.*

As you know, the two cylinder *four* cycle furnishes only *one* impulse every *fourth* time the fly-wheel turns.



In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

THOMAS

1906

In spite of the fact that we are completing the finest fire-proof factory in the world, with a capacity of one thousand high powered automobiles per annum, it looks very much as though last year's scramble for Thomas Cars was going to be repeated.

Last year, premiums of all the way from $150 to $750 were refused for Thomas cars. We were likewise compelled to refuse orders for 50% of our capacity.

The only sales we lost were those of a few unposted persons here and there, who couldn't see how so much value could be sold at so reasonable a price.

That idea was demolished last season, and the fact that the 1906 Thomas is far costlier than the 1905 model without a change in price makes it unquestionably the greatest automobile value in the world to-day.

In brief, what you have to consider is a car which demonstrated last year its superiority to cars costing from $1,500 to $4,000 more money.

A car with 50 H. P. (actual), which is quieter than it was last year; smoother than it was last year; has larger motors; is far more beautiful; far more comfortable, seating five or eight, all fronting forward; with perfect clutch; perfect control; four-speed Hess-Bright ball bearing transmission; four powerful brakes; forgings throughout; material guaranteed to be the costliest made; fifteen Hess-Bright bearings and one roller.

Analysing this 1906 offering of power, beauty and the highest degree of construction, and bearing in mind what I have said to you about the probability of a greater demand than we can supply even with our increased capacity of 1,000 high powered automobiles per annum —do you not think it advisable for you to investigate the Thomas without delay by consulting our nearest representative?

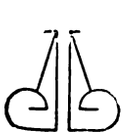
Congratulations

from a dealer in a rough-road country on the service obtained from

GOODRICH TIRES



WITH THE BAILEY TREAD.

"We wish to congratulate you because of the splendid way your Goodrich-Bailey tires have given satisfaction and service to us and our customers. They not only wear longest with the least show of use, but seem to be free from weak spots, such as fabric breaks and rubber and fabric parting company on the Tread, the latter seems to be a sure thing on some tires that we know of.

We are looking to 1906 Goodrich and expect to be partial to them, because we believe they deserve it if their previous reputation is any criterion to go by."

—*Asheville Cycle and Auto Co.*, Sept. 23, 1905.

THE BAILEY "WON'T SLIP TIRE." Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, sleaing or skidding.

Rims branded in the channel with this copyright mark have been ispected and pronounced perfect. We guarantee our tires only on rims so branded.

G&J

Motor Car Tires

THE MOST SERVICEABLE TIRES MADE

No Internal Heating

The thread fabric construction makes the tire so pliable that it changes position in service with the least possible resistance, which means that the tires are very resilient, fast, and free from internal heating.

No Pinched Tubes

The tire is fitted with a flap, which prevents the tube from coming in contact with the rim, or from getting under the edges of the case, preventing pinched tubes.

No Creeping

The flap forms a strong frictional contact with the edges of the clinches, holding the edges firmly to the rim for its entire circumference, so that it is impossible for the tire to creep.

HAYNES

A RECORD OF RECORDS.

We entered the Vanderbilt Cup Elimination Race for only one purpose. We wanted to demonstrate what a HAYNES touring car could—and would do, in competition with racing monsters.

We had been making what some people called extravagant Claims for the HAYNES—and we wanted to prove them.

They are proven.

The HAYNES finished as neat a race as was ever witnessed, and won a place entitling it to representation on the American Team.

The Haynes Car will be the selling car of next season.

This evidence is conclusive evidence to the intending purchaser.

We want a few good agents. Write quick for particulars.

Orders for this car are booked in the order of their receipt.

The Incomparable WHITE

The Car for Service.

MODEL "F" SIDE-ENTRANCE WHITE

This is the sixth model of the incomparable White steam car to be offered to the public. In our judgment, and in that of the many automobilists who have seen the car, the Model "F" leaves nothing to be desired.

There is something more than the luxurious appearance of the car, its speed and noiselessness of running, to influence your judgment in favor of our car. That "something more" is the uniform and unbroken success of White cars in all reliability and endurance contests, starting in 1901, and an unequaled record of accomplishment by a host of private owners.

THINK IT OVER

THE CELEBRATED BRAMPTON CHAINS

Made from Self-Hardening Steel.

Morris & Wilmarth,
Stock, Grain, Cotton and Coffee,
32 Broadway,
New York, July 22nd 1905

Mr. C. E. Miller,
496 Reade Str.,
New York.

Dear Sir:-

I wish to write you regarding the Brampton chains which I purchased for my Franklin car.

No. 1 I have used all the time and have given it about as hard a pull as it is possible for a chain to receive. All over the mountains of Orange County, New York, and between New York, Philadelphia and Lakewood until I am tired of the road.

The long chain on the Franklin is a pretty staff proposition and many, in fact, most of my friends state that their first trouble on that car is that chain breaks and I have met people who have worked for hours to get their chain fixed on the road, but I have never met a Brampton in trouble and mine so far has not a scratch on it.

No. 2 is in the paper in which your salesman wrapped it for me, and is resting in the bottom of the car waiting for No. 1 to break.

My partner, Mr. Wilmarth, President of the L. I. Automobile Club, has a Brampton on his Winton and has had practically the same result as myself. He got me in line for the Brampton and there I stay.

Very truly yours,

Dict.

No More Borrowing Cars Without Owner's Permission

The Hill Lock Valve

(here shown), is a new device and a good one. It is connected at any convenient place in the gasolene pipe and when locked and the key withdrawn prevents the gasolene from flowing to the carburettor and consequently the engine cannot be started. The key cannot be taken from the lock until the gasolene supply is entirely shut off—when shut off keep the key in your pocket. Impossible for anyone to steal your car. Your fuel supply is **locked,** but your car can be pushed to the wash-stand for cleaning, or into the street in case of fire. It is a small device made entirely of brass and turned with a "special key"—no two keys are alike. The lock is of the finest grade, it has five tumblers and cannot be picked or opened without the "right" key. Three keys are furnished with each lock. The locks are perfectly tight, being tested by gasolene under a pressure of one hundred pounds. It is made for all sizes of pipe from the smallest motor-cycle or launch to the most powerful touring car. Price, $5.00. **Special price to Supply Houses and Automobile Manufacturers.** Apply to your supplyman or garage. If not found in stock, address

E HILL, Jr.,

Why Goodyear Detachable Auto Tires Won't Rim Cut

WHEN an Auto Tire gets rim-cut, it's time to feel for your pocket-book and ask yourself, "What tire shall I get *next* time?"

For a rim-cut tire is pretty near its finish.

And the chances are ten to one that if you are forced to ride around the block on an ordinary tire with ordinary rims your tire will be rim-cut before you get there. Because ordinary rims are just like a dull jack-knife. Now if you wished to cut a strap with that dull knife, and the strap was held like Fig. 1 you couldn't do it, because your strength would not be great enough. But if you take the strap like Fig. 2, with a little sawing you can cut it.

Fig. 1

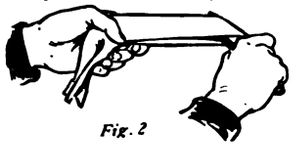

Fig. 2

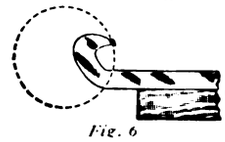
Fig. 3

Fig. 4



That's exactly the way the ordinary rim cuts the ordinary tire. When the tire is inflated, like Fig. 3, even the tremendous weight of the car is not sufficient to cause the rim to cut the tire.

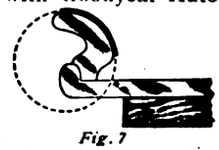


Fig. 5

But just as soon as it gets flat, like Fig. 4, then the rim begins to cut it, just as the knife did the strap in Fig. 2.

Now look at the picture of the Goodyear Auto Tire on the Goodyear Universal Rim (Fig. 5.) The portion of the rim against which the tire rests forms the arc of a large circle. That rim can no more cut the tire than you could have cut the strap by using the handle of the knife instead of the blade.

Fig. 6

Notice the edge of the ordinary rim used with ordinary tires (made into a circle), in Fig. 6, and compare with the Goodyear Universal Rim, used with Goodyear Auto Tires (Fig. 7.) Then you can see more clearly what we mean.

Fig. 7

We (and others) have ridden the Goodyear Auto Tire on Universal Rims *absolutely flat* for **25 miles** on rough roads without the least injury to the tire. We have the evidence if you would like to see it.

This is only one reason why wise riders are specifying Goodyear Auto Tires on Universal Rims for their new cars. Our "Good News Book" gives ALL the reasons. It is intensely interesting to Manusacturers, Dealers and Riders seeking relief from tire troubles.

PUT YOUR FINGER ON THIS.

¶ Many automobiles will, when in perfect condition and under control of an expert demonstrator, surmount extreme road conditions with apparent ease.

¶ Experienced users will tell you this is not enough. The practical motor car should have reserve power sufficient to meet all road requirements under adverse motor conditions and in the hands of the ordinary non-professional operator.

¶ The Rambler has this surplus power. It is a matter of paramount importance.

SURREY, TYPE ONE, a five-passenger, medium-weight touring car, ready for the road, with lamps, horn and full equipment of tools, etc; $1200. Cape top or canopy top, with glass front, $100 extra,

SURREY, TYPE TWO, a five-psssenger touring car, of more elaborate design, with double chain drive, full canopy top and glass front, $1650.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, November 2, 1905. No. 6

TO WHOM COMMISSIONS BELONG

Massachusetts Supreme Court Settles a Vexed Question—Dismisses Maker's Appeal.

That much mooted question as to whether an agent in one town is entitled to commissions on sales made by an agent in other territory to residents in the territory of the party of the first part has been again decided, this time by the full bench of the Supreme Court of Massachusetts in the case of Dr. Roy M. Garfield, of Worcester, against the Peerless Motor Car Co.

As the agent of the company, Garfield claimed to have had exclusive sale of its motor cars in Worcester and vicinity, and asserted that he was entitled to the commissions for the two cars sold at the Boston agency of the company to persons who resided within his territory. At the trial he introduced evidence to show that, although the contract did not especially provide for such conditions, he was entitled to the commission by the usage of the trade. To the admission of this evidence and to the refusal of the presiding judge to give certain rulings, the company excepted.

The verdict was for the plaintiff for $840 and interest, the full amount of the commission claimed by Garfield on both sales. It was the contention of the company that the place where the sale was made, and not the residence of the buyer, governed the payment of commissions.

Thomas Plans Paris Excursion.

If the plans of E. R. Thomas, of the E. R. Thomas Motor Co., do not go awry, there will be a considerable delegation of Americans present at the Paris show, which opens December 8.

Mr. Thomas himself had decided to go when the idea of making up a party suggested itself. Accordingly he obtained steamship and hotel rates, and found that the trip on an excursion basis can be made at a wonderfully low rate, not to exceed $225, which includes the best of accommodations. He has suggested to all of the Thomas agents the desirability of visiting the show, and has extended the invitation to join the party to Americans generally. He believes that they have nothing to fear or to lose, and that there may be something to gain by viewing the best and latest that Europe holds. The plans as outlined will bring the party home in ample time for Christmas.

New Foundry in Hartford.

The Capitol Foundry Co., recently organized by Waterburg (Conn.) men, has secured the old plant of the Standard Foundry Co., in Hartford, and is making ready to bid for the trade in automobile castings. The officers of the Capitol Foundry Co. are: President and general manager, F. W. Stickle; vice-president, A. A. Tanner; secretary, William B. Judd; treasurer, Frank S. Wilmot. They are all Waterbury men. Mr. Stickle was lately with the Manufacturers' Foundry Co., of that city.

Export Trade Maintains Strength.

During the month of September, 1905, the value of automobiles exported was $194,499, as against $123,487 for the same month of the previous year, an increase of $71,012. For the nine months ending September, 1905, the total value of exports amounted to $2,235,633, as compared with $1,445,986 for the same period of the preceding year, a gain of $789,647.

Fire Destroys 1500 Automobiles.

One of the biggest fires in the history of the automobile industry occurred at Chicago, Ill., on last Friday, 27th ult., when 1,500 cars were destroyed at the factory at No. 914 West Lake street, but, strange to relate, the pecuniary loss was small—$1,000. The building was occupied by the Acme Toy Automobile Co.

Pope Disposes of Providence Branch.

The Pope Mfg. Co. have discontinued their branch in Providence, R. I., and disposed of its effects. The garage and the accessories were sold to the Shepard Co., agents for the Pierce cars, while the Pope agency was placed with the Rhode Island Motor Car Co.

Body Plant Goes Up in Flames.

Fire on Friday morning last, 27th ult., destroyed the plant of the Central Mfg. Co., makers of automobile bodies, at Connersville, Ind., entailing a loss of $100,000. The insurance is $28,340.

CADILLAC CONSOLIDATION

Formally Perfected, it Entails Slight Change of Name—Capital Increased Fivefold.

What was the Cadillac Automobile Co., of Detroit, capital $300,000, is now the Cadillac Motor Car Co., capital $1,500,000.

The change was made on Friday last, 27th ult., when the new-old company filed its papers with the Michigan authorities.

It marked the formal amalgamation of the Cadillac Automobile Co. and the Leland & Faulconer Mfg. Co., which have been closely allied for a considerable time. The latter concern at all times made the Cadillac engines, and virtually joined interests with the Cadillac Automobile Co. several months since. Following the filing of the certificate Lew W. Bowen, A. E. F. White, Clarence A. Black, William H. Murphy, Henry M. Leland, William E. Metzger and Wilfred C. Leland were elected directors of the new company.

The capital stock of $1,500,000 is divided into 15,000 shares of $100 each, the stockholders named being Clarence A. Black, Lem W. Bowen and Henry M. Leland, 5,000 shares each. Portions of their allotments are held as trustees. The objects of the association stated, are to manufacture, buy and sell cars, carriages, wagons, boats and vehicles of all kinds; to manufacture, buy and sell castings, tools, machinery, motors and engines.

None of the capital stock is paid in in cash. The total net assets of the Cadillac Automobile Co. are given as $1,000,000, of which $200,000 is business and goodwill. Buildings and land at Cass and Amsterdam avenues are valued at $418,118.26; cash, $39,416.81; merchandise (finished product and raw material), $358,733.21; machinery, tools, patterns, models, fixtures, supplies, etc., making up the total.

The Leland & Faulconer Mfg. Co. puts in: Cash, $123,249.34; outstanding accounts, $40,349.87; machinery and foundry equipment, $104,059.34; merchandise and supplies, $93,866.15; business and goodwill, $75,000, with indebtedness, $31,000, making the total net asets $500,000.

The stock has been to a great extent in the

Digitized by Google

same hands, and a co-relation has existed among the officers of the two concerns. Those of the Cadillac Automobile Co. were: President C. A. Black; vice-president, A. E. F. White; secretary, Lem W. Bowen; treasurer, William H. Murphy; assistant treasurer, Wilfred C. Leland; general manager, Henry M. Leland and those of the Leland & Faulconer Mfg. Co.: President, Lem W. Bowen; vice-president, A. E. F. White; secretary, William H. Murphy; treasurer, W. C. Leland; general manager: Henry M. Leland.

"The business of both concerns has shown a remarkable growth," said Henry M. Leland. "While the original companies were organized with a capital stock of $300,000 and $175,000, respectively, I can say that every dollar of the present capitalization is represented by something tangible. The Cadillac Automobile Co. did a larger business last year than any other automobile company in the world, its output being 4,000 machines. We do not believe in declaring dividends before they are made or counting our chickens before they are hatched; but we think we are safe in expecting a still larger business next year."

Kansas City to Have Big Plant.

Before January 1 the Kansas City Motor Car Co., which was recently incorporated with a capital of $150,000, and which absorbed the business of the Caps Bros. Mfg. Co., of Kansas City, expects to have its first cars on the market. The Caps brothers have been making cars in a modest way for several years—probably a dozen or so having been turned out—but the new company will, it is declared, build at least one car a day. The product will consist of light gasolene propelled touring cars and delivery wagons. Each car will bear the name "The Kansas City Car," which has been copyrighted.

The company has purchased a thirty acre tract of land on Independence road, in the east bottom district of Kansas City, and the factory buildings are already under way. Two of them are 50x150 feet in dimensions, two stories high, and the blacksmith shop 50x50 feet. All are of brick. The officers are: President, Frank E. Wear; vice-president, J. E. Caps; secretary treasurer, R. Caps; general manager, George K. Wheeler, and superintendent, John C. Caps. Mr. Wear, Mr. Wheeler and J. E. Caps are directors.

De Dietrich Sold Out at Auction.

Short work was made of the effects of the De Dietrich American branch. They were ordered sold by the receiver, and were disposed of under the hammer on Thursday last at the New York garage of the embarrassed concern. Fifteen cars and one motor boat were sold, netting a little more than $38,000. The car which Gabriel drove in the Vanderbilt race last fall, which was valued at $15,000, brought a beggerly $1,950. It was purchased by Walter Allen, of the former firm of Allen, Halle & Co., who has acquired the De Dietrich rights for this country. A so-called "Pullman" car, worth $16,000, was bid in for $3,500, while most of the touring cars brought but one-half of their listed price.

The Week's Incorporations.

New Orleans, La.—The Independent Auto Co., Ltd., under Louisiana laws, with $15,000 capital. Corporators not named.

Detroit, Mich.—The Modern Motor & Machine Co., under Michigan laws, with $15,000 capital. Corporators not named.

Portland, Me.—H. J. Willard Co., under Maine laws, with $100,000 capital; to make automobiles. President and treasurer, H. J. Willard.

Cincinnati, Ohio—The Auto Car Co., under Ohio laws, with $25,000 capital; to conduct a garage. Corporators—Herbert Van Ness and James Ratliffe.

St. Joseph, Mo.—The Wyeth Automobile & Supply Co., under Missouri laws, with $5,000 capital. Corporators—Huston Wyeth and J. Edgar Eberly.

New York City, N. Y.—The Alborak Auto Co., under New York laws, with $3,000 capital. Corporators—J. T. Finn, E. F. Sullivan and G. E. Welsh.

Hornellsville, N. Y.—Archer & Co., under New York laws, with $10,000 capital; to manufacture motors. Corporators—A. M. Archer, L. M. Archer and E. G. Stanley.

Cleveland, Ohio—Paxton Motor Co., under Ohio laws, with $10,000 capital. Corporators—Calvin D. Paxton, Robert Dash, Charles B. Solders, Otto T. Leisy and Alvin D. Paxton.

Indianapolis, Ind.—The Muncie Auto Parts Co., under Indiana laws, with $15,000 capital. Corporators—Hugh L. Warner, Charles T. Quale, C. Roy Hathaway and Harvey L. Hooke.

Cleveland, Ohio—Glenville Garage & Machine Co., under Ohio laws, with $5,000 capital. Corporators—Jay L. Lewis, J. F. Kirtland, C. F. R. Phillips, C. M. Phillips and Oak McCray.

New Brunswick, N. J.—Middlesex Motor Co., under New Jersey laws, with $50,000 capital; to deal in automobiles. Corporators—H. Clark Saunders, Louis A. Voorhees and Charles A. White.

Toledo, Ohio—Commercial Motor Truck Co., under Ohio laws, with $20,000 capital; to manufacture gasolene commercial vehicles. Corporators—Charles S. Keller, John E. Moran, H. W. Hoover, Gus Haas and Otto Kreiger.

Albany, N. Y.—Albany Garage Co., under New York laws, with $50,000 capital; to make, sell and store horseless vehicles. Corporators—E. Palmer Gavit, Matthew Van Alstyne, W. L. L. Peltz, Wm. A. Visscher and Frederick W. Rockwell.

Matheson's New Factory at Wilkes-Barre.

According to present indications, the Matheson Motor Car Co., of Holyoke, Mass., will be installed in its new home in Wilkes-Barre, Pa., long before January 1, as progress in the building of the factory has surpassed expectation. Some parts of the plant will be in operation within six weeks, as the work of construction will permit, the first hundred feet of the main building being completed and the workmen are now putting up the second section.

The plans call for one main building one story high, 600x80 feet, to be constructed of concrete, fireproof throughout. In connection with the main structure there will be a blacksmith shop, the latter being 80 feet in length and 60 feet in width. The boiler house will also be separate from the others, and that will be 30x40 feet. Only a short distance from it the engine house will be located, and it will be the same size as the boiler room. There will be a number of offices, and room will be allowed on either side of the building for any additions that might want to be made. The general location of the building could not be surpassed, as it is situated on a farm, around which there are acres of untouched land, all of which will be utilized for the erection of dwelling houses for the company's employes.

Last week at Wilkes-Barre the directors met and elected all the officers but a treasurer, this vacancy to be filled later. The officers elected were: President, Charles W. Matheson; vice-president, Henry W. Palmer; secretary, F. F. Matheson; directors, Lowell M. Palmer, Henry U. Palmer and Henry M. Brigham, of Brooklyn, N. Y.; Charles W. Matheson, F. F. Matheson and Charles R. Greuter, of Holyoke, Mass; J. Fred Mueller, of Grand Rapids, Mich.; F. M. Kirby, T. L. Newell, W. C. Sheperd and R. Nelson Bennett, of Wilkes-Barre, Pa.

Armory Will Be Ready.

Reports that have been afloat that the 69th Regiment's Armory in New York would not be completed in time to permit of the holding of the A. C. A. or "Independent" show in January, were given their quietus this week. The Motor and Accessory Manufacturers made inquiry on the point and were given the fullest and most convincing assurances that the structure will be finished in ample season.

Orange County's First Car.

The first automobile ever constructed in Orange County, N. Y., is awaiting its finishing touch—namely, a coat of paint—at the Miller cart factory in Goshen. It is a 30 horsepower gasolene car, built as an experiment. If it goes, the cart company will doubtless change its name.

M. & W. Opens in Portland.

Morgan & Wright have established a branch at No. 86 Sixth street, Portland, Ore. It will be conducted in connection with the Ballou & Wright business at that address.

The Auto & Power Appliance Co., of Cleveland, Ohio, has increased its capital from $25,000 to $200,000.

TWEED HAS A SECRET

It Makes Steam and Gasolene Unnecessary and—But Read the Wondrous Tale Yourself.

Perpetual motion has broken loose again, this time in Minnesota, and, judging from all appearances, the attack is one of the worst on record. Of course, the automobile is the immediate cause of the outbreak, and, though the malady has thus asumed one of the most virulent forms imaginable, but a single victim has succumbed to it up to the present, so far as it known.

The particular manner in which the much desired phenomenon is to be accomplished in this case is by the use of a new combination of metals (blended secretly by the inventor), which acts on steel in such a way as to overcome the effect of the action of gravitation temporarily, and at the will of the master hand. The following enthusiastic description, which is preceded by the statement that the inventor, Thomas Tweed, of Wheatly, Minn., is even now on his way to St. Paul to exhibit there his wonderful contrivance, speaks for itself.

"The motive principle is entirely new and is certainly the greatest thing on record. It looks much like any other autombile except that, standing erect at the back of it are two cylinders of solid steel, nickel plated and weighing five hundred pounds each. They are attached by levers and wheels to the running gear of the machine, and as they alternately move up and down they propel the vehicle at any required speed along the road, without any expenditure of steam or gas or anything else that costs anything for motive power.

"The wonderful principle of the invention is this: that Mr. Tweed has discovered a combination of metals, a secret with him, of course, that possesses the marvellous power of insulating the attraction of gravitation.

"The metal in the discs is alternately placed by automatic machinery first under one of the steel cylinders and then under the other, the one under which it is placed immediately losing all its weight and being raised by the other, which in descending turns the machinery if the automobile. When the descending cylinder has reached its lowest point the insulating disc is moved beneath it and away from below the other, and the weight is instantly changed to the upper cylinder, which in its turn moves the running gear as it comes down. Each cylinder has its separate disc, and the power can be regulated with far greater accuracy than is possible with any other means of propulsion. It can be made to run up a steep hill at the rate of twenty miles an hour, or to creep along a hard, level pavement at a speed not exceeding two miles per hour.

"Mr. Tweed in his first public test of the machine, ran it thirty miles an hour for forty-eight consecutive hours, a distance of 1,440 miles, without a second's stop and at a total cost of only 17 cents, which was for oil. He and a friend took on a load of provisions and lived in the car for the two days."

For a Factory in Mexico.

A syndicate of St. Louis, Mo., capitalists, in which H. L. Hull seems to be the leading spirit, has made application to the Mexican government for a concession to establish a factory for making automobiles and locomotives. The petition states that the company is willing to invest $1,000,000 near the City of Mexico or in one of the States bordering upon the federal district. It also binds itself to commence constructing the buildings within a year after the granting of the concession. The petition asks for the free importation for ten years of all the material used; all models for engines, boilers, iron work, etc. It also asks for exemption from taxation for ten years on all the capital put into the business, with the exception of the stamp tax, which is never remitted.

Blomstrom Adding Two Big Buildings

When the two new additions to the C. H. Blomstrom Motor Co.'s plant, Detroit, Mich., are complete, the capacity of the concern will be trebled. Two brick buildings, one 290x50 feet, and the other 150x50, will be ready for occupancy in a fortnight. Each building is two stories high, and will be used for assembling and finishing purposes. The machine shop will remain in the old building.

Continental Increasing Its Facilities.

The Continental Motor Co., of Muskegon, Mich., has contracted for a new factory building at the corner of Market and Water streets. It will be 120 feet long and 65 feet wide, two stories high, with a wing 30 by 60 feet for the boilers, storage, storeroom and vault for tools and patterns. It will have a concrete foundation, with walls of solid brick. The contract price is $10,000.

Oxford to Move to Fostoria.

By subscribing for $50,000 of the capital of $300,000 of the Detroit-Oxford Automobile Co., now located at Oxford, the Board of Trade has induced the concern to move to Fostoria, Ohio. The company contracts to build and sell two hundred cars at $1,500 each during the first year.

Making Headway in Pittsburg.

The recently incorporated Pittsburg Motor Vehicle Co., of the city from which it takes its name, is erecting a one story frame factory building at Summerlea and Georgia streets. The estimated cost is $6,000.

Ford Opens in Detroit.

The Ford Motor Car Co., of Detroit, has opened a branch in Buffalo, N. Y., at 727 Main street. A. M. Robbins will be manager.

CLIFTON CHOSEN AGAIN

A. L. A. M. Re-elects Him President—All Other Old Officers Also Retained.

The members of the Association of Licensed Automobile Manufacturers think a lot of the men who have served their official interests during the year, and not without reason. They had an opportunity to demonstrate the fact yesterday and they did so in convincing fashion. It was then that the annual meeting of the association occurred at the New York offices. It was a very full meeting and it lost no time in re-electing each and every one of the old officials, as follows:

President—Charles Clifton, George N. Pierce Company, Buffalo, N. Y.

Vice-President—William E. Metzger, Cadillac Motor Car Company, Detroit, Mich.

Secretary—L. H. Kittredge, Peerless Motor Car Company, Cleveland, Ohio.

Treasurer—H. H. Franklin, H. H. Franklin Manufacturing Company, Syracuse, N. Y.

Executive Committee—Chas. Clifton, F. L. Smith, Olds Motor Works; E. H. Cutler, Knox Automobile Company; M. J. Budlong, Electric Vehicle Company, and S. T. Davis, Jr., Locomobile Company of America.

And, as a matter of course,

General Manager—George H. Day.

Allotting the Show Space.

H. W. Chapin, D. J. Post, H. E. Raymond, J. W. Gilson and Peter Steenstrup, who constitute the Allotment Committee of the Motor and Accessory Manufacturers, are in session this week at the Hotel Astor, New York, apportioning the space set aside for them at the several shows. Yesterday they finished with Madison Square Garden and to-day will take up the A. C. A. show at the 69th Regiment Armory. To-morrow will be devoted to the Chicago exhibition. The committee's task is not proving an easy one, as there are about 130 of their members to be provided for, and considerable pruning and squeezing have been found necessary to make room for all of them.

Whitney Buys a Factory Site.

The Whitney Mfg. Co., the well known chain makers, of Hartford, Conn., last week purchased a factory site on Hamilton street, in that city, on which ultimately they will erect a big plant. It is not likely, however, that building operations will commence for a year or so, as the Whitney lease of their present quarters has still a considerable period to run. The new site is adjacent to the plants of the Hartford Rubber Works Co. and the Whitlock Coil Pipe Co.

New One in Chicago.

The Charter Mfg. Co. is the style of the new concern that has taken over the business of the Lubricator Mfg. Co. In addition to the lubricators, it will handle a general line of automobiles and railway supplies.

The Constructive Principle of Fisk Tires Involves

A Technique So Simple in Manipulation and So Positively Accident-Proof

that it should readily appeal to any discriminating purchaser.

Beads of a wedge shape are applied to a flat rim and held by rings which are rolled on an angle corresponding to that of the bead, so that when drawn down by clamping bolts, the bead acts as an inside cone wedge, with the result that the tire is firmly held to the rim, without air pressure or circumferential contraction.

A Tire so Locked to the Rim Incorporates a "Life Preserving Principle" and Reduces Tire Maintenance to an Economic Basis.

CADILLAC CONFIDENCE

During October we have booked orders from dealers for just 1120 Cadillacs for 1906 delivery—only a starter.

Every one of these dealers has ordered at least as many cars as he had in 1905, in some cases twice the quantity. But not one of them has even seen a sample of the cars he's bought.

Taking Chances?

Not a bit. They know that Cadillacs have always been right, and as the Cadillac Company has never led them astray, they have confidence that they will continue to be right. No freaks, no experiments to be tried on the public—just Cadillacs.

They know that Cadillacs are the kind that give satisfaction, the kind that sell and stay sold and don't worry them to death afterward. They know, too, that most buyers know it and that the others are learning it fast.

We're talking 1906 business.

CADILLAC MOTOR CAR CO. - - - - Detroit, Mich.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, NOVEMBER 2, 1905.

For 7000 Miles of Good Roads.

Don't overlook that ballot for fifty million dollars' worth of good roads—Amendment No. 5, as it will be officially styled.

Only New Yorkers can cast the ballot, but the automobilists of many other States will "root" for it, and right vigorously, too.

The very prospect of seven thousand miles of additional good roads in the Empire State is enough to make the automobilists of every other State open wide their eyes. The bare suggestion of a hard, smooth, macadam highway from New York to Buffalo should be sufficient to bring pleasant dreams to the owners of every vehicle of whatever nature in New York, and their families and friends. The opportunity to obtain it is worth considerable self-sacrifice.

That opportunity will be forthcoming on Tuesday next. Don't neglect it.

Clutch Tendencies.

Clutches have come and gone, most of them on paper to be sure, but some in practise, in spite of which it was not until the advent of the present year bringing with it the multiple disc type that the supremacy of the old leatherfaced cone was at all threatened. One of the most peculiar features of the adoption of the latter form is the fact that despite its much greater cost and complication it has been taken by builders of the highest priced and cheapest cars simultaneously. It was a feature on at least a few of the line of one foreign maker of high repute as early as the fall of 1904, on which it was adopted as a standard part of the equipment a few months later, but of these cars the price of the cheapest ran well into the thousands. At the same time it became a feature of the 1905 line of a domestic builder, whose most ambitious effort does not list at much over the four figure mark. And it has also been adopted by some whose product is at neither one of these extremes—the middle class that constitutes such a very large part of the annual total output.

Not that the multiple disc is the only competitor in the field against the simple cone type. There are others, but with the exception of the growing use of the planetary change speed gear, which does away with a main clutch, and must now be reckoned with as a factor on cars of greater power than ever before, the adoption of these rivals has been in such scattering instances as to make but faint impression on the whole. They have their advantages no doubt, but believers are few, and, as goes without saying, they likewise have their disadvantages, and when weighed in the balance appear to have been found wanting in the majority of instances. To return to the multiple disc type, many reasons will be apparent upon observation as to why it is superior in some respects to other forms and why on the other hand it has drawbacks which make some designers chary of placing faith in it.

In the first place, to take its bad points before its good ones, it is a vastly more complicated piece of mechanicism than the leather faced cone, for example, and further, its initial cost is correspondingly greater. In other words, it costs the maker considerably more to make it a feature of his car than the installation of the cone would. Should it happen to go wrong on the road there are many chances that its repair will prove a hopeless job for the average chauffeur, where the latter would under circumstances no more serious be capable of putting the cone clutch in condition to get home with. Further than that, repairs are apt to cost more, for it is not such a simple matter to dismount and reassemble it. But, coming round to its good points, it is not apt to require the repairs so often. Metal is opposed to metal instead of to leather, and, more than that, the area of the opposing surfaces is far greater and they run in oil. Despite the very lightest form that can be given to the cone clutch, this must be made of rather large diameter, usually that of the interior of the fly-wheel, and its inertia and moment are on this account found to be unduly great. Owing to the number of discs or plates it is possible to employ it becomes practical as well as feasible to make these very small comparatively, with good results. The use of lubricating oil between the plates renders it necessary to squeeze out the film thus formed before they take hold positively, so that it is not as easy, if possible, to engage this form with the same unpleasant suddenness that has usually characterized the use of the simple form at the hands of the inexperienced driver. In short, with the multiple disc type a "fierce" clutch should not be possible, and this means as well that it is not given to sticking to the same extent, for there is nothing to "freeze" it together.

Taken all in all, the advantages of this type appear to appeal to designers favorably, as is indicated by its increasing adoption, some additions to the ranks for 1906 having already announced the fact of their conversion. It would thus seem to be gradually getting a firmer hold by retaining those adherents already acquired and constantly augmenting the number, for, so far as known, none who have once made it a part of the standard equipment of their cars have discarded it, either for a return to older forms or in favor of something new. Despite this, so far as numbers are concerned, the internal cone still reigns supreme, and probably will never disappear altogether.

No Trade Control of Sport!

It is right and proper that the trade should seek to discourage attempts to hold contests held at manifestly unwise and unfavorable seasons of the year, but it is wholly improper that any trade should seek practically to arrogate to itself the control of any sport by virtually adopting a sanction system. It is a dangerous procedure.

Sport and trade cannot be made to com-

Digitized by Google

mingle, and in every effort to force such a state of affairs there lurks the germ of unlimited mischief and turmoil which can benefit neither department.

The National Association of Automobile Manufacturers should have a care in attempting anything of the sort. It is the privilege of every one to stay out of a contest if he chooses to do so. To employ a club to force him to do so is—well, it is very unwise, and likely to prove a boomerang.

What Constitutes Finality.

Finality is a word seldom used in its strict significance in speaking of engineering design to whatever applied. Locomotive design followed the same lines for such a number of years consecutively, with no change other than that brought about by increased demands for power necessitating correspondingly larger parts, that the statement of its having reached finality was apparently well founded, and held good for such a period that its disturbance appeared extremely remote. Then experiments with compounding demonstrated the efficiency of the latter, and to a small extent at least the compound has displaced the single acting locomotive.

There are those who stand ready to predict that the motor car, in so far as its basic design is concerned, has approached very close to what may be termed finality. And this is probably as true of the car of to-day as it ever will be of the motor driven vehicle of the future. Given the dimensions and design of the essentials of a score of the cars now turned out by representative builders, there would not be the slightest difficulty in tabulating them and with the result bring forth a composite by equalizing the small differences apparent. And this car that represented the maker of each of the twenty from which it had been evolved could be adopted by any of them as his own as a model for duplication without diverging materially from the design he previously followed.

So much for the small differences extant among the great number of cars now on the market. Has this close approach to uniformity been the result of slavish copying or of a general recognition of the fact, tardy in some cases to be sure, that the specifications embodied in the present day type were those best adapted in every way for the end in view? Observation of the trend of development in the past few years indicates that both were factors of powerful influence in the matter. With the appearance of what is now the accepted standard, some makers immediately discarded the results of several year's study and experiment and copied the new form; others were firm in the belief that they were on the right track and adhered to their original conceptions, even after the widespread adoption of the new form had demonstrated not alone its far greater superiority from an engineering standpoint, but likewise its universal popularity. This, of course, has reference to the gradual displacement of the horizontal engine under the body by the vertical motor under the bonnet for all except light cars. And the same holds true with regard to many details of design not calling for such a sweeping change.

For example, take the case of valve operation; the automatic valve has been dying a lingering death for two or three years past, and is still on the scene, though its representation is so greatly diminished that it may well be said to be at its last gasp. The same applies to the armored wood frame, though possibly not to an equal degree. It in turn has gradually been displaced by steel. Batteries are slowly giving way to mechanical forms of ignition, and the accumulator is taking the place of the dry cells, but here the transition is much more gradual, for various reasons. But probably in none of the instances cited, and they represent but a fraction of those that might be brought forward, will the form that has had to give way before an improvement that has ousted it as standard construction disappear entirely. Nevertheless, the improvements, after having stood the test of several years' use, may properly be said to represent finality of design of the element they represent.

Once an industry has successfully emerged from the chrysalis stage, revolutionizing changes are about as improbable as they were frequent when in the throes of transition. With a generaly recognized starting point of conceded high efficiency, further development must in the very nature of things be gradual. Thus in one sense, the car of to-day may well be said to represent finality of basic design as much as did the locomotive of a quarter of a century ago. But it will mean little, for while the car of 1906 will be practically indistinguishable in the majority of instances from its immediate predecessor, and the same will hold good in the case of those of each succeeding year as far in the future as it is desired to look ahead, the car of a quarter century hence, if compared with that of to-day, may make the latter appear archaic, though each of the steps in the process that brought this about occurred so imperceptibly that it could readily be said of any one of them that it marked finality of design where it was concerned.

Motor Cars for Candidates.

What would the politician of to-day do without the motor car? is a question that is hardly more answerable than the other, What did the politician of yesterday do without it?

To-day, the political aspirant makes his bow to the populace of one borough, says his little say, bows again, and in twenty minutes is making the same bow and saying the same say to the howling accompaniment of the enthusiasts of the next borough, twenty miles or so away. In another half hour he will be fifteen or twenty miles further on, and enthusiasm will still be making men's throats raw and thirsty. Wherever he goes he is followed by a group of reporters, who count the crowd and listen to the band at each stopping place, and then follow on to the next. They also are in motor cars.

In the old days it was all done, but in long delayed fashion, through the medium of that well known institution, the "Hack." Sometimes it took all of two days to do it. Sometimes it took two hacks, a railway train and a horsecar, and then the meeting had to adjourn because the candidate had been delayed in transit. It is all very wonderful, and one of the wonders that is yet not at all wonderful is how the politicians set at defiance the speed laws of their enactment, and with not a cop to say them nay.

The electioneering automobilist is of necessity a scorcher, but woe betide the "cop" who has the hardihood to attempt checking the speed.

According to a tale from the West, a man in Milwaukee had a cook who, when he purchased a motor car manifested so much interest in it that he allowed her to learn to operate it. Now she is a full fledged chauffeuse, goes on long runs, cares for the machine and even does a bit of repairing now and then. When the coachman-chauffeur began to crowd out the machinest-chauffeur there was a deal of wailing from the latter fraternity, but the sequence was inevitable, as the occupation of the former was being supplanted. But when the chook-chauffeuse begins to gather up her apron and prepare to manipulate the tire-iron and the monkey wrench, what will the chauffeurs' union have to say and who will get dinner?

WHEN BUYERS COME TO BUY

Here's the Line of Talk the "Association" Hands Out—"Just-As-Good" a Leading Card.

If industry, assisted by "just-as-good" argument, counts for aught, it is reasonably certain that the "Automobile Buyers' Association," which recently took up its abode in the Metropolis, will not lack that quality which is supposed to contribute so largely to business success. When the buyer of a second-hand car in search of equipment located the association on the second floor of a downtown building, he found one man in blue jeans, shirt sleeves, under a paint besmeared automobile cap, assiduously applying kalsomine to the walls of the office where the Automobile Buyers' Association has located itself. One desk occupied a railed off portion of the room, and the varnish on the panels was still damp. There was ample room for stock, but none was in sight.

"Yes, this is the 'Auto' Buyers' Association," vouchsafed the individual on the stepladder with the paint brush in one hand, as he critically inspected his visitor. "What can I do for you?"

"Well, I wanted to see the manager concerning the purchase of some supplies," replied the visitor, "but there does not seem to be any one about."

"Yes, yes," hastily interposed the man upon the ladder as he scrambled down and took a seat at the aforementioned desk. "I'm your man. You see, we have just moved in and I am getting the office ready for our large stock.

"Tires? Oh, that's easy—can quote you prices far below anybody else. What size? 30x3½. Any particular make? The X——? Let's see."

Then he hastily figured on an envelope which bore the business card of the association in one corner.

"I can give you a set of four, all complete—inner tubes, lugs and all—for —— each, but why don't you take the Z tire? It is just as good, if not better, and I can give it to you for less money. Why, certainly, they're brand new; no madeover tires in ours. Give you makers' guarantee beside our own guarantee, and if they are not as represented, why—'Money Cheerfully Refunded'—that's our rule.

"But hold on! I-'ve-e got an i-d-e-a— Just the thing! Save you lots of money. Funny I did not think of it sooner! Why not join our association and derive all the benefits?"

Then he launched off into the abstract and began to unfold the plans and objects of the Automobile Buyers' Association—"the pioneers in the field of cooperative purchase of supplies."

"We intend to get out a mammoth catalogue—sorry I haven't one to give you now, but the printers are so slow—that will embrace everything ever made for the auto, and what is more to the point, we'll list every article cheaper than any other house. Now, of course, anyone is privileged to buy from us at catalogue prices, but by enrolling with the association a person is entitled to an additional 5 per cent off catalogue prices. The cost for membership is only $1—a mere matter of form to pay for the extra work of the secretary in keeping accounts. We expect to get 20,000 members, so we will make a little something, although we have to cut margins so close.

"Every member of the association will receive an additional 5 per cent when his purchase amounts to $100. Oh, no! You don't have to buy that amount all at once. We will open a ledger account with each member, and in addition to his 5 per cent off on every purchase, when the purchases amount to $100 he will be credited with $5—take it out in trade or cash—doesn't make any difference to us."

"Better try the Z— tires, though; you'd save $8 on the set. Same thing, same price, same service, same profit to us, and in every way just as good and we can quote you better figures. Isn't that a splendid investment for a dollar, though? Better let me put your name down as 'Member No. 1.'

"Lamps? Certainly; all kinds. Why, we handle everything but the automobile itself. Well, for your car you would want two side lamps. Acetylene; they're the only reliable kind. Have to have a generator, but that does not cost much. The S— and the R— lamps are very good, but they are controlled by the trusts. (Sic!) You see, the manufacturers would not sell me any goods if I cut prices on them. Of course, you would get your membership discount of 10 per cent. Those S— or R— lamps would cost you in the neighborhood of $70 complete, but we are having a lamp made expressly for us—just as good, never blows out, our written guarantee goes with each set. I can give you a pair of side lamps, complete with generator and save you good money. You'd better join.

"How are we able to quote such prices? Oh, we divide our discount with you.

"What do I know about the Blank Storage Company, on —— street? You had better keep away from them. We have to be straight—working under a charter of the State of New York, capital $10,000. See, here is our seal and our stock blanks."

He produced a book of highly lithographed stock certificates, the only noteworthy feature of which was the noticeable lack of any names being inscribed to the shares. He did not condescend to explain why none had been sold. Then he produced a typewritten list of names.

"These are all owners, 20,000 of them. We will send them our catalogue as soon as it is off the press, and expect to have them enroll. We belong to an association that furnishes us the names of all automobile owners in the country—they are genuine—every one of them. That is how we can get the business."

The details of his business—the business of the Automobile Buyers' Association—having been fully explained, he let fall some interesting remarks anent the business methods of the so-called storage company.

"I'll tell you why you should keep away from them. I worked for them several years as salesman. When a man comes in to buy anything the clerk sizes him up pretty accurately. If he looks prosperous and 'easy' he gets 'stuck,' that's all. Suppose, now you came in the store to buy a second-hand lamp and I waited on you. If you looked 'easy' it would be to my advantage to 'do' you. I would trot out a lamp that we usually sell for $5, but if we were beaten down long enough would probably let go for $3.

" 'How much?' you ask.

" 'Twelve dolars,' I reply.

"If you haggled over the price I might let you have it for $10. If I beat you out of $5 the company gives me $1 for my shrewdness. It is just that way all along.

"But we—the Auto Buyers' Association—are doing a legitimate business. The charter you, know. We have to.

"Sorry you won't enroll to-day; it would be to your everlasting advantage. However, any time will do. Come in again," concluded the "Automobile Buyers Association," as he vacated the revolving chair at the desk to resume his work with the paint and brush.

Stage Lines Formed and Forming.

Press dispatches for the week ending November 2 announce the inauguration of the following motor stage lines:

Emery, S. D.—G. A. Tusla, a liveryman, has purchased a motor car for use in his business and will replace his stagecoach with it.

Nyack, N. Y.—Stockholders of the Rockland County Motor Stage Co. voted at a regular meeting to purchase a trial vehicle at once and put it into experimental service over the proposed route without delay.

Cambridge, Ohio—A line of fifteen passenger coaches, to run between Cambridge and Wheeling, W. Va., over the old National Pike. Two coaches will start simultaneously from Fairview, located about midway between the two points, and will proceed in either direction. Through pasengers will be transferred at this point. Two round trips will be made daily.

The following proposed motor stage routes are also recorded:

Versailles, Ind.—L. H. Hotchkiss, of Dayton, Ohio, is urging the installation of a line tween Osgood and Vevay.

Xenia, Ohio—J. S. Harshman, of Springfield, and George and William Smith, of Cedarville, are promoting a line between Xenia and Cedarville.

Urbana, Ohio—John Jenkins, of Urbana, is about to inaugurate a trial line between Urbana and Mechanicsburg. A single machine will be used as a feeler.

Plano, Ill.—M. Fisher, of the Joliet and Aurora Electric Railway, of Joliet, and ex-Mayor John Raymond, of Aurora, are planning a line between Yorkville, Plano and Sandwich. Two fourteen-passenger 'buses will be put on experimentally.

In the Retail World.

The Reo Automobile Co. has opened a new garage at 283 Halsey street, Newark, N. J.

William Brennan is preparing to build a garage on Church street, Long Branch, N. J.

Frank A. Miller purposes building a garage on Seventh street, near the Southern Pacific Railroad property at Riverside, Cal.

Don P. McClure, of Oskaloosa, Iowa, is enlarging his garage in that city. A complete repair shop, of course, figures in the plans.

Thomas Dolan is preparing to erect a garage at Torresdale, Pa. The building will be of stone, two stories and measure 53x88 feet.

Lane & Parsons, of Hartford, Conn, will establish a machine tool manufacturing and automobile repair shop at Sodus, N. Y. Operations will not begin, however, until next year.

Ground has been broken in Atlantic City for the erection of a garage for Andrew P. Johnston, which, he claims, will be the largest in the State. It will be finished by spring and is to cost $125,000.

Herbert Austin has assumed control of the Acme Automobile Co., at 484 Broad street, Newark, N. J., formerly run by L. J. Wyckoff. Mr. Austin has not yet decided what machines he will carry.

C. R. Deuch, the Erie, Pa., dealer, has moved into his new two story fireproof garage, 82½x82½ feet, at Twelfth and State streets. A new feature is the use of steam pressure for cleaning cars.

A force of men are razing a number of old frame buildings on the property of the Lock Haven Knitting Co., on Cornisa street, Lock Haven, Pa. Calvin R. Armstrong will erect a large garage on the site.

The Auto Car Co., which has just been incorporated at Cincinnati, Ohio, with $25,000 capital, intends to build a garage at Eighth and Sycamore streets, that city. The structure will be of concrete—that is, fireproof.

The Rockford (Ill.) Tack & Nail Co. has decided to discontinue the tack business and devote their energies toward the business of selling and repairing motor cars. The agency for several well known cars has been secured.

The Essex Automobile Co., Newark, N. J., is constructing a new building, 50x60 feet in dimensions, one story high, adjoining their present location in Lombardy street. The building will be one story high, and will have a cement floor.

The Autocar agency in Providence, R. I., which for the last two years has been conducted by Thomas & Lowe, with A. S. Hitchcock as manager, has been taken over by A. S. Hitchcock and G. H. Brown. They will occupy a store at 13 Dorrance street, and will operate as Hitchcock & Brown.

A. E. Morrison, former manager of the Peerless branch in Boston, who recently formed the Morrison-Tyler Motor Co., in that city, has finally located at 121 Masachusetts avenue, opposite Boyleston street. In addition to the Rainier, he will also handle the Maxwell-Briscoe line.

Homan & Schultz are the latest New York dealers to make ready to move northward of Columbus Circle. They have leased a portion of the four story garage which is to be erected at the southwest corner of Broadway and 62d street.

The Auto Supply and Storage Co., of Baltimore, Md., which for the past six months has leased the building at 1,416 Madison avenue, has purchased the property and will make a number of improvements. A two story addition to the rear, 28x60 feet, is among the projections.

A new garage has been opened in Little Washington, Pa., by Swart & Bailey, which will in all probability be operated as a subagency of the Standard Automobile Co., of Pittsburg. An extensive line of cars will be carried, including the Pope-Toledo, Pope-Waverly, Winton, Packard and Olds.

A five story fireproof, brick, stone, concrete and steel garage will be erected by the Albany Garage Co., of Albany, N. Y., on Chapel street. Its dimensions will be 66x72 feet. The salesrooms will occupy the entire first floor, and the remaining stores will be utilized for storerooms, repair shop, offices and waiting rooms. The building will be equipped with electric elevators, turntables, etc. C. Sutherland Ransom will be general manager of the company.

H. Clarke Saunders, the veteran bicycle dealer of New Brunswick, N. J., has incorporated as the Middlesex Motor Co., of which he is the president. Charles A. White is vice-president, and Louis A. Voorhies secretary-treasurer. The company has secured options on a large tract of ground at Carroll place, corner of George and New streets, in the heart of the city, and will shortly build a large one story stone garage. The White steam car will be the leader.

General J. T. Cutting, the head of the new Oldsmobile Co. of New York, is to celebrate the fifth anniversary of the entry of the Oldsmobile into this city by a reunion of Oldsmobile owners. He has engaged the Empire City track for Election Day, November 7, and invited all owners of Olds cars to participate in the reunion. Following luncheon and a drawing for a 1906 Olds runabout, a number of short races and gymkhana events will be run on the track.

Edward Talcott Moore, of Newburg, N. Y., is a born inventor, according to a local newspaper. He began inventing at the early age of ten years, and has continued the practice at intervals up to the present time. Now, at the age of twenty, he is inventing his way through Syracuse University, having just entered the freshman class. After having perfected an electric clock, and an electric massage machine, he turned his attention to automobiles, and has lately received $5,000 royalty on an automatic switch for shifting the ignition current from the battery to the magneto.

Manhattan Storage Catches a Tartar.

For at least once in their rather interesting and more recent career the Manhattan Storage Co., which is the title under which the New York firm of Grinburg & Morris prefer to trade, have paid the price of one of their ways of doing business.

Several months since a man with a used Indian motor bicycle entered their establishment and offered it for sale. The price was low enough to induce them to purchase it without even asking to see the bill of sale. In due course they sold the machine at a considerable advance, of course. Also in due course F. A. Baker, a Brooklyn dealer, sought the purchaser of an Indian motor bicycle which he had sold on the installment plan, only to discover that he had defaulted his payments and skipped the country, after having become embroiled in some trouble and after disposing of the machine to Grinburg & Morris. Several months later the missing Indian was discovered in Long Branch, N. J. The owner of it readily told where he had bought it in good faith.

Baker promptly called on Grinburg & Morris to settle. They indignantly told him that he would have to fight for his money. He immediately accepted the challenge and instituted suit in the Brooklyn civil court. Twice was the trial postponed. It was due to come up again on Tuesday last. But on Monday both Grinburg and Morris, who are said to have retentive memories, thought of the past, and a great white light dawned on them; with the dawning disappeared all desire for "fight" and the publicity which it would entail. They had recourse to their checkbook and wrote out a check for what probably is the most expensive motor bicycle they ever handled. The amount included even the fees of Baker's lawyers.

How Dealers Will be Admitted.

The show committee of the Association of licensed Automobile Manufacturers has indicated the exact procedure that will govern "trade admissions" to the Madison Square Garden Show. As was already known, these admissions will be limited to the morning hours previous to 11 o'clock, but to prevent the abuse of the privilege that has existed in the past, the visiting dealer, on entering the building on the first day will be required to sign the registry book, and also sign his name on the back of his card. To obtain admittance on the remaining days he must prove his identity by again signing his name, which signature must correspond with that on the back of the card.

"Possible," not "Imposible."

In the Morgan & Wright advertisement of last week it was stated that "by a series of exhaustive tests we have proven that it is impossible to so thoroughly amalgamate these parts as to make separation practically impossible; and every Morgan & Wright tire must stand the test before it leaves the factory." The use of the word "impossible" was a clerical error. It should have read "possible," a distinction with a mighty difference.

Economy Test Shows Effects of Solar Plexus Punch.

When a man or event receives a powerful punch in the solar plexus, if he or it presents a limp appearance there is ample excuse for it.

This is the case with the so-called national economy test promoted by the New York Motor Club, which was inaugurated on Monday last, 30th ult. It is national in name only; and if the blunt truth be told, is of merely passing importance. The club, however, is in no wise responsible for this state of affairs. It undertook the task in good faith, but without regard to season. At this time of the year automobile manufacturers are bending every energy to producing models for the succeeding season. They have thought and time for little else; least of all have they a desire to exploit their old cars.

The New York Motor Club took no cognizance of these conditions, and went ahead with the promotion of its economy test as if all was easy sailing. Then it was that a solar plexus punch was delivered by the National Association of Automobile Manufacturers, which "whereased and resolved" that, as this is no time of the year for contests of any nature, members should hold aloof therefrom. The resolution was not binding, but it was generally respected. It was the punch that doubled up the "economy test" and left it limp and groggy. The club held onto the ropes, however, and tried hard to smile. As the blow did not wholly knock the contest down and out, the promoters tried to put on as brave a face as possible, and, although every move since the blow

Digitized by Google

was administered has brought a wince, they are "going through the motions" as originally outlined.

The motions began on Monday, when nine cars set out from the starting point in New York. Of the nine but one is representative of the older and more conspicuous makers. As five classes had been provided for and a gold and silver medal "hung up" for each class, it is evident that honors will be easy.

The starters were as follows:

No. 1—24 H. P. Frayer-Miller, Lee Frayer, driver. Total weight required, 750 pounds. Passengers, Lee Frayer, driver, 155 pounds; E. S. Williams, 179½; H. H. Knepper, 145; R. Atkinson, 149; J. P. Walker, 134. Total live weight, 762½ pounds. Left at 8:38 a. m.

No. 2—20 H. P. Marmon, A. Largensen, driver. Total weight required, 600 pounds. Passengers, A. Largensen, 183 pounds; O. H. Slacer, 137½; Theo. Schulz, 149; C. Levine, 161. Total live weight, 630½ pounds. Left at 9:19 a. m.

No. 3—16 H. P. Reo omnibus, R. L. Lockwood, driver. Total weight required, 1,500 pounds. Passengers, R. L. Lockwood, 129 pounds; C. H. Craft, 149; Duncan Curry, 198; Mrs. Duncan Curry, 138; W. A. Enders, 175; Mrs. W. A. Enders, 172; R. H. Montgomery, 188; Mrs. Leary, 159; John C. Wetmore, 157; Mrs. Hodgdon, 127. Total live weight, 1,692 pounds. Left at 8:50 a. m.

No. 4—8 H. P. Reo runabout, C. C. Singer, driver. Total weight required, 600 pounds. Passengers, C. C. Singer, 134 pounds; J. C. Cochrane, 196; F. O. Edwards, 152; R. M. Owen, 140. Total live weight, 622 pounds. Left at 8:43 a. m.

No. 5—15 H. P. Compound, D. F. Graham, driver. Weight required, 750 pounds. Passengers, D. F. Graham, 217 pounds; A. E. Schwartz, 165; A. Lazzaro, 127; J. L. Alexander, 178; F. X. Brown, 170½. Total live weight, 857½ pounds. Left at 9:01 a. m.

No. 6—15 H. P. Compound, F. C. Carter, driver. Total weight required, 750 pounds. Passengers, F. C. Carter, 144 pounds; R. D. Palmer, 179½; S. F. Gallaher, 174; V. M. Coyne, 164; H. Kelly, 78. Total live weight, 739½ pounds. Ballast, 10½ pounds. Total weight, 750 pounds. Left at 8:44 a. m.

No. 7—15 H. P. Compound, C. P. Hatch, driver. Total weight required, 600 pounds. Passengers, C. P. Hatch, 127½ pounds; George A. Banker, 170; Mrs. C. P. Hatch, 141½; J. W. Hatch, 167½. Total live weight, 606½ pounds. Left at 8:55 a. m.

No. 8—8 H. P. Oldsmobile. Total weight required, 600 pounds. F. Munroe, driver. Passengers, F. Munroe, 149 pounds; W. C. Hancock, 176; W. H. Harrison, 123; T. Gleason, 166. Total live weight, 605 pounds. Left at 8:43 a. m.

No. 9—20 H. P. Wayne, A. L. Kull, driver. Total weight required, 750 pounds. Passengers, A. L. Kull, 210 pounds; E. L. Ferguson, 145½; F. Gremmell, 145; J. G. Moore, 165; A. F. Comancho, 140. Total live weight, 805½ pounds. Left at 9:07 a. m.

There was no crush at the starting point. There was none there whose business did not require it—the few officials, a handful of newspaper men and photographers, with a few disinterested plasterers who were working on the Smith & Malby garage. Had it not been for the placards on the competing cars the few passersby would not have turned an eyelash.

The cars had been filed with gasolene and oil and the tanks sealed the night before and left where they were until between the hours of 8 and 10 o'clock. The first to get away was the Frazer-Miller. It left at 8:38 a. m. Each car carried an observer and its quota of passengers, the former to keep detailed records of all repairs, adjustments and replacements, oil and gasolene used and all expenditures.

Monday's objective point was Philadelphia, and with the exception of No. 5, the 12-15 horsepower compound driven by D. F. Graham, which stripped its gears near New Brunswick, N. J., all the cars arrived at the City of Brotherly Love in good shape. The little Olds runabout lost one of its passengers at New Brunswick. He had arisen to stretch himself, when the car swung around a curve and pitched him out. He was rendered unconscious, but was not seriously hurt. The record of the day was made by the 16 horsepower Reo omnibus driven by R. L. Lockwood. The expenditure for gasolene was $2.18¾, figured at 25 cents per gallon; 25 cents for oil; 93¾ cents for time consumed putting in a chain link and $2.21 for ferry charges, making a total of $5.58½ for ten passengers, or 55 4-5 cents per capita.

As the gasolene tank of the air-cooled Frazer-Miller had not been opened on Monday, its consumption could not be obtained. Its only expenditure was for ferry toll, which amounted to $1.69. Excepting the Frazer-Miller, the Reo runabout had the lowest expense account of any car—$1.07 for fuel and $2,62½ for total expenses. The Oldsmobile spent $1.65⅝ for gasolene and 3⅜ cents for oil. Its total expense was $4.38, averaging $1.09 per passenger.

As none of the minor expenses, such as charges for repairs on machinery and tires, are yet forthcoming, it is difficult to summarize the performance of each car.

Tuesday's run was back to New York. One accident caused the only excitement during the day, and, fortunately, it was not serious. A. L. Kull, in the Wayne, met with four runaway mules near Merchantville, and rather than "buck" against the obstinacy of the oncoming quadrupeds he decided quickly and ditched the car. Only two spokes in one of the rear wheels were broken, and as the committee concluded the accident was unavoidable the Wayne car will be allowed to continue the contest on a new wheel, no charge being made against it.

As several of the passengers liked the fraternal atmosphere of the Quaker City, three of the contesting cars were shy ballast when the start was about to be made for New York. The Reo 'bus took on three high school boys, who were glad to play "hookey" for one day, and the Olds runabout and the Wayne each brought a Philadelphian to Manhattan.

The Compound, driven by C. P. Hatch, blew out a tire near Hightstown and had to replace a shoe at a cost of $28.50. The Marmon was the only other machine to encounter trouble, having 18¾ cents for mechanical and $1.12½ for tire troubles charged against it. As the tanks had not been opened the average expense for the return trip from Philadelphia could not be figured.

However small the operating expense may be the test so far has brought to light the great cost of ferriage. On the trip to and from Philadelphia the cars were required to use the ferry no less than six times, and this will increase the expense to a remarkable degree. For instance, the ferriage of the Reo 'bus for two days amounted to $5.72.

Before even leaving New York on the third day's run to Albany the Frayer-Miller No. 1 came to grief. At Central Bridge it stripped its gears, and finally started for the capital after a delay of thirteen hours. Of the survivors the Marmon car No. 2, which led the contestant from Philadelphia Tuesday, was the first to finish at Albany Wednesday night, having covered the 150 miles in 9 hours [illegible] minutes.

Quite a sensation was sprung in Albany when one of the observers reported to the committee that six passengers in the Reo 'bus left the car at one point and gave it a boost over a hill. The referee added to the cost $2.25 for labor, making its total cost $7.73½ for the day's run to Albany, or 77.3 cents per passenger. Lockwood, the driver, has filed a protest.

Six runs, one each day, constitute the economy test, as follows: New York to Philadelphia, Pa., 90 miles; Philadelphia to New York, 90 miles; New York to Albany, N. Y., 150 miles; Albany to New York, 150 miles; New York to Southampton, L. I., 101 miles; Southampton to New York, 101 miles. Total distance, 682 miles.

The basis of comparative charge as against railway transportation for the entire test shall be as follows: New York to Philadelphia and return, per passenger, $4.00; New York to Albany and return, per passenger, $6.00; New York to Southampton and return, per passenger, $4.53.

The basis of charge will be as follows:

Gasolene, 25 cents per gallon; machine oil, 40 cents per gallon; cylinder oil, 80 cents per gallon; time of engine or general repairs, 75 cents per hour; new parts, catalogue price; chain repairs, 50 cents per hour and catalogue price of new links; all moneys paid for any purpose, such as legal fines, bridge tolls, ferry charges and necessary fees of all description.

Tire charges will be: Time of tire repairs, 50 cents an hour, charges to be assessed in respect to any occupant of the car who assists or any repair man on route; punctures of inner tubes, 75 cents each; blow-outs of inner tubes, 75 cents each; time to inflate inner tubes or replace same, 50 cents per hour.

MONDAY—NEW YORK TO PHILADELPHIA—90 MILES.

ROCKFORD, ITS RACEMEET

Not What Was Originally Planned, but Honors Were Easy and Well Distributed.

About October 1, when the leaves began to turn, the Rockford (Ill.) Automobile Club issued a "defi" to Fate. They were going to break the bonds of superstition and hold a race meet on the 13th of the month, and, furthermore, there were going to be just thirteen events, and in one of the events thirteen cars would start. Well, the meet "came off," but not at the time intended, nor were there thirteen events or thirteen cars in any one of them. The hoodoo could not be broken, "bad cess to it!" On the 13th ult. it rained. Jupiter Pluvius opened the floodgate with a vengeance. Evidently frightened at their temerity in defying superstition, the officials of the Rockford Automobile Club, who had the affair in charge, decided to postpone the meet until Wednesday of last week, the 25th ult. To further guard against a repetition of the weather on the 13th, the number of events was scratched.

It worked like a charm, and although the races were few, with fewer entries, the five or six hundred spectators who had assembled at the Driving Club track seemed to get keen enjoyment from the sport. The fastest time of the day was made by L. Gordon Harrison, in a Stevens-Duryea, who drove a mile exhibition in 1:15 flat. What was expected to be the biggest event of the day proved a fizzle. Harrison's Stevens-Duryea lined up against Shoemaker's Searchmont, and the result can easily be imagined. The inevitable something or other happened to one of the few cars of this latter make in existence, and it went down and out before the three-mile post. Harrison finished the five miles in his own dust in 6:50. The two-mile event, for runabouts, was closely contested, and resulted in a victory for J. E. Miller's Maxwell. In the three-mile event, for fully equipped touring cars, Harry Owens, driving a 22 horsepower Buick, crossed the tape first. Another Buick, with Havens at the wheel, finished second. Time, 5:05. In the three times around race, for air-cooled cars, James Rogers, in a Premier, finished first. Strachan, in a Marion, was second. Time, 4:37½. The summaries:

Two miles, special—J. E. Miller, 8 h. p. Maxwell, first; William McPherson, 9 h. p. Cadillac, second; Carpenter, 8 h. p. Rambler, third; Dwight Cutler, 7 h. p. Oldsmobile, fourth. Time, 4:08½.

Three miles, for touring cars, fully equipped and carrying four passengers—Harry Owens, 22 h. p. Buick, first; Havens, 22 h. p. Buick, second; Bennett, 16 h. p. Rambler, third. Time, 5:05.

Three miles, for air-cooled cars—James Rogers, 16 h. p. Premier, first; Strachan, 16 h. p. Marion, second; Rex Savage, 14 h. p. Franklin, third. Time, 4:37 1-5.

Five miles, for cars over 20 h. p.—L. G. Harrison, 22 h. p. Stevens-Duryea, first; Shoemaker, 30 h. p. Searchmont, broke down. Time, 6:50.

One mile against time—L. G. Harrison, Stevens-Duryea. Time, 1:15.

What Minneapolis Will Teach Them.

The young Men's Christian Association of Minneapolis, Minn., is one of the most recent branches of this organization to take up the study of the motor car in detail. The curriculum provides a series of ten lessons, as follows: Lesson 1, Four cycle gasolene engines—its history; ignition, exhaust, suction and compression; 2, valves, exhaust inlet, automatic and machine worked; 3, spark system, coils, vibrators, commutators, advancement and time of spark; 4, carburetters, needle, pin and flat variety; 5, oiling and cooling systems; 6, bearings and vibrations, including the principle of muffling and smell and "soft coal smoke"; 7, transmissions and clutches; 8, chains and shaft and the steering gear and batteries; 9, rear axle and springs, including general method of attachment and repairing; 10, setting and tightening wheel bearings, and removing and repairing tires.

Tag Test Case Up for Hearing.

The Unwin test case, which is an attack on the validity of all laws imposing a license or registration fee, and which is backed up by the National Association of Automobile Manufacturers, was yesterday given a hearing in the Court of Common Pleas for Hudson County, New Jersey. Counsellor Terry, for the defendant, filed a vigorous brief of some thirty-four typewritten pages, in which he aggressively attacked the legality of the New Jersey law. He handled the whole tag and numbering system without gloves and maintained that it "violates those clauses of the Federal Constitution which prohibit double taxation and which guarantee that every citizen shall have equal protection, and that no citizen shall be deprived of his liberty or property without due process of law."

"Ju tice" in Gov. Folk's State.

Loaded shotguns are now used to punctuate the ethics of the police trap in St. Louis, Mo., the masked battery being considered a necessary adjunct to the usual stopwatch and handkerchief equipment. On Sunday, October 29, no less than four parties of prominent motorists were held up peremptorily and bade to "stand and deliver" in the most modern and approved fashion. One of them was halted and ordered to show his receipt for his license fee. Although he displayed the number, when he failed to produce the receipt he was taken into a barn, "tried" and "relieved" of $19.50.

Why Wicks Favors Cup Races.

At least one man has given ample proof that the Vanderbilt Cup race pays. He is J. Wicks, who owned the farm land on which the grandstand was erected and who let the parking, tenting and other privileges. He this week placed an order for a 30 horsepower Pope-Toledo.

ORMOND, ITS PROGRAMME

Championships f r Everyone and a Large Bid for a Record and Press Notices.

The programme for the Ormond-Daytona Carnival, which will occur during the week of January 22, made its appearance this week. With it came out what was a matter of fairly general knowledge, i. e., that the two Florida towns and several hotels having buried their rivalries and other differences W. J. Morgan would again manage the carnival for the Florida East Coast Automobile Association. In the events scheduled, which are as follows, a bid will be made for two miles a minute, in an event of that distance which requires that the winner shall attain that pace, which will supply good material for press notices if it serves no other purpose:

One-mile middleweight championship (gasolene).

One-mile heavyweight championship (gasolene).

One-mile championship (steam).

One-mile world's championship, free for all. for Dewar Cup.

One-kilometre record trials for each weight and power class.

One-mile record trials for each weight and power class.

Two-miles-a-minute record, free for all. (The winner must equal or exceed 120 miles an hour.)

Five-mile middleweight championship (gasolene).

Five-mile heavyweight championship (gasolene).

Five-mile championship (steam).

Five-mile free-for-all championship.

Ten-mile middleweight championship (all powers).

Ten-mile heavyweight championship (all powers).

Ten-mile free-for-all championship.

Ten-mile handicap—Open to contestants who start in previous events.

Fifteen-mile free-for-all championship.

Fifteen-mile pace handicap for American touring cars fully equipped.

Thirty-mile free-for-all championship for American-built cars.

One-hundred-mile free-for-all championship.

Senator's Drastic Cure for Drunks.

State Senator McKee, of Paterson, N. J., has announced to his constituents that he will introduce at the coming session of the legislature an amendment to the State automobile law. It provides a penalty of three years in prison and a fine of $1,000, without the alternative of either, for any person caught driving an automobile in the State while intoxicated.

New York Association Adopts Signboard.

At the quarterly meeting of the board of directors of the New York State Automobile Association, held at Rochester, Saturday, 21st ult., it was naturally decided to favor the proposed amendment to the constitution providing for the issuance of bonds by the State for the sum of $50,000,000 for good roads.. A signboard of metal, a blue background with white block letters four inches high, was adopted as the official signboard of the association, and will be placed at intersecting roads throughout the State, and it was voted to have headquarters of the association at the two shows to be held in New York City during the week of January 13 to 20. The admission of three new clubs—the Watertown Automobile Club, the Cataraugus County A. C. and the Richmond County Club—to membership completed the business, when the directors were entertained at luncheon by the Rochester organization.

Dayton not Dead but Disrupted.

Apparently the report that the Dayton (Ohio) Automobile Club had decided to "shut up shop" because of a lack of interest was a little previous. It was simply a factional fight that caused the old officers to resign, but new ones were immediately elected, as follows: President, Bert Wolf; vice-president, J. J. Cooper; secretary-treasurer, W. J. Lukaswitz; directors, John Rock, W. J. Lukaswitz, Louis J. Wehner, Adolph Latin and Joseph L. Schenck. A committee was appointed to secure new club quarters.

Scranton Motorists Get Together.

Preliminary formation of an automobile club took place at Scranton, Pa., last week. These officers and committees were chosen: President, M. B. Fuller; vice-president, Thomas Sprague; secretary, Robert Peck; treasurer, A. P. Bedford; executive committee, Valentine Bliss, G. A. Singer and G. B. Jermyer; committee on roads, A. B. Dunning and G. A. Singer; committee on constitution and bylaws, F. M. Vandling, M. L. Smith and Alfred Harvey.

Vermont Club Elects Officers.

At the annual meeting of the Vermont Automobile Club, the following officers were elected for the ensuing year: President, H. W. Hall, Burlington; first vice-president, J. M. Boutwell, Montpelier; second vice-president, J. B. Manley, Brattleboro; secretary-treasurer, John W. Gordon, Barre. The report of the secretary-treasurer showed the finances of the club to be in a healthy condition and gave the membership as 108.

Sholes is Cleveland's President.

F. T. Sholes was elected president of the Cleveland (Ohio) Automobile Club at the annual election held last week. The other officers chosen were: Vice-President, A. Ward Foote; secretary, George Collister; treasurer, Windsor T. White.

Again Attacking Pennsylvania's Law.

Argument on the validity of the act of April 23, 1903, General Assembly, State of Pennsylvania, governing suits for damages arising from the use of motor vehicles, was heard in the Court of Common Pleas, Philadelphia, last week on a motion to strike off a non-suit in the case of Frank J. Floyd against Albert H. Chandler.

In January last a valuable trotting mare owned by Floyd ran away on Montgomery Pike on account of the alleged carelessness of Chandler, who was driving an automobile and did not stop when requested. The mare fell and was badly injured. Floyd brought suit for $1,200 against Chandler, but Judge Audenried entered a non-suit, ruling that the suit should have been brought in Montgomery County, where the accident occurred, according to the terms of the act of April, 1903. Attorney Robert P. Kelly, in his motion to strike off the non-suit, declared that the act was unconstitutional under previous acts. He argued that the legislature has the right to make an act regulating the use of automobiles as a police regulation, but that when it attempted to determine the jurisdiction in which suits for damages should be tried it went beyond its limits. The court reserved decision.

Ohio Women Make a Discovery.

According to Ohioians the Woman's Club of Canton, is one of the "brainiest" organizations in the country. They have discovered a new proof that the prophets of the Old Testament days were divinely inspired and that they were given a long look into the future. Not only did they foretell the destruction of the city of Jerusalem, the coming of the Christ and other historical events, but the ladies have discovered that the prophet Naham stood in spirit at the threshold of the Twentieth century and saw the automobiles gliding over the asphalt avenues and boulevards, or saw the devil wagon racers touring the country roads and leaving in their wake the maimed and the dead. This fact was demonstrated by passages of the Old Testament quoted and read at a meeting of the club.

Farson Again Named for President.

By placing John Farson at the head of the regular ticket of officers for the Chicago Automobile Club, to be voted on at the annual election next week, the nominating committee sprung a coup on the three rival factions. Instead of three tickets and a warm campaign, the annual election is likely to be the quietest in the history of the club, with little, if any, opposition to any member of the regular ticket. The ticket follows: For president, John Farson; first vice-president, Allen S. Ray; second vice-president, B. H. Marshall; secretary, Sidney S. Gorham; treasurer, T. J. Hyman; directors, Ira M. Cobe, Robert Tarrant, Jr., F. C. Donald, N. H. Van Sicklen, Jerome Ellis and Charles Gregory.

Long Swamp Road is Opened.

When the widening of what is known as the Long Swamp road, near Scranton, Pa., is completed automobilists will have at least one highway in the country where they can open the throttle without fear of being haled into court. The road is the private property of the Scranton Gas & Water Co., and until now automobiles have been prohibited from using it. The work of widening will be completed by November 15, and will be made so that two automobiles can pass with safety at any point. This will complete the system of roads that the Scranton Gas & Water Co., through the efforts of its president, W. W. Scranton, has constructed at great expense around Lake Scranton and in that vicinity.

Warding Off Winter Weather Effects.

Now that the promise of cold weather is growing more assertive, all the motorists' kind friends are offering advice as to the best methods of caring for the machine during the winter months. Generally they advise the use of a calcium chloride solution on the cooling system. They tell how to mix it and how to put it in the tanks, but they never stop to give directions for removing the crystals which are certain to accumulate before the opening of spring. It should be remembered in this connection that glycerine and alcohol, when properly blended in solution, give absolutely no trouble on this score, and, besides, serve to absolute advantage in warding off the effects of the cold.

Levi Spins a Golden Yarn.

Gold mining by automobile has now come into vogue, say the daily paragraphers, and cite the case of J. E. Levi, of somewhere in the East, who claims to have a gold nugget three inches in diameter mined a la motor car. The story told is that Levi stopped in Denver to have his touring car overhauled after a tour through Southern Colorado. While wiping off some of the machinery the gold nugget dropped to the floor. The explanation seems to be that the gold was caught by a wheel, thrown up and lodged securely in the mechanism at the bottom of the car, while travelling the rough country near La Junta.

"See France" by Motor Bus.

A new phase of the commercial motor car proposition has been opened up by the recent announcement of the London Motor Omnibus Co., which has been running 'busses in the great metropolis for several months to good advantage, that on November 18 a special motor coach will leave London, provided a sufficient number of seats have been taken, for a thirty days' tour through France. The route will include a circuit taking in Nice, Monte Carlo and Mentone, returning by a different way, and the fare of 50 guineas will include first class accommodations for passengers and baggage throughout, the tour being personally conducted.

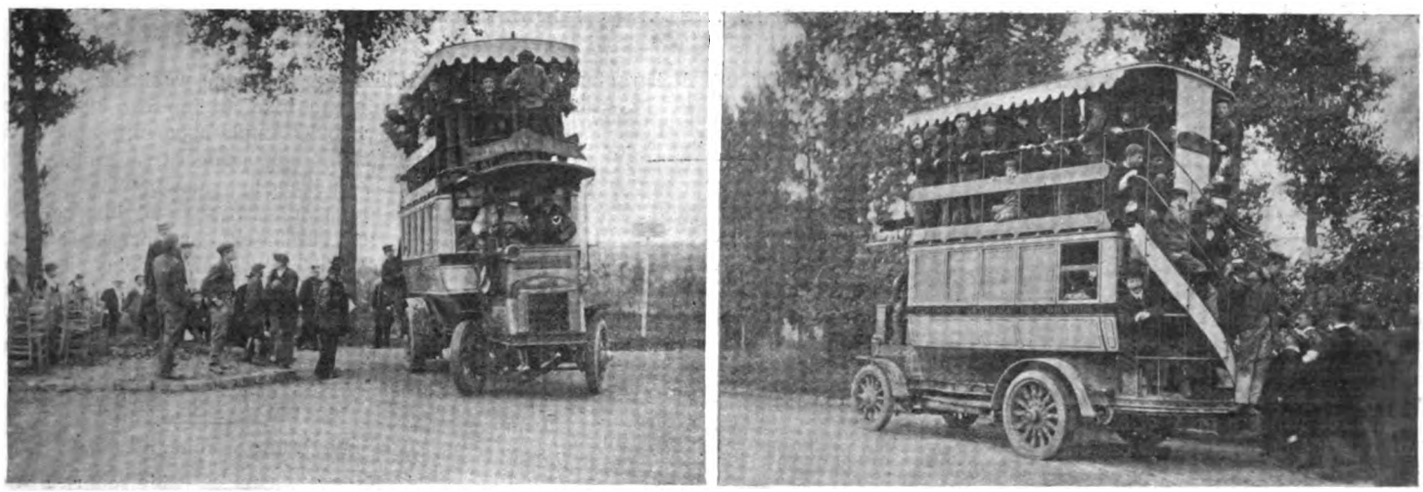
WHAT PARIS TALKS ABOUT

Last of Season's Contests and Outlook for those of Future—Basis for Touring Trials.

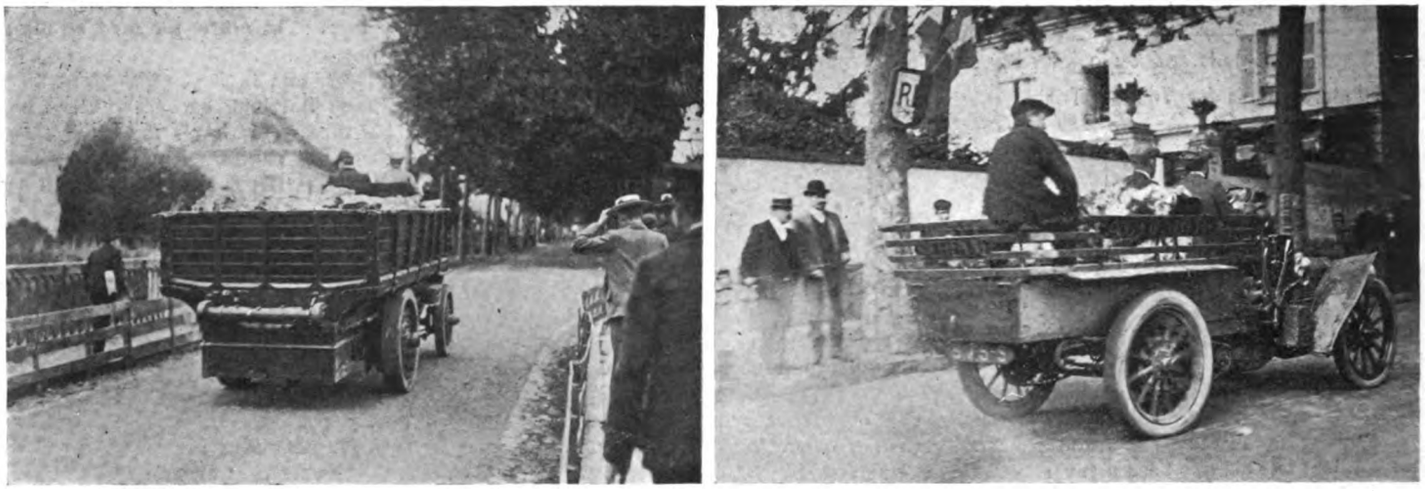
Paris, Oct. 20.—Of the three automobile meetings which terminate the season, the final one at Gaillon on Sunday helped to retrieve the partial failures of the previous contests at Chateau-Thierry and Dourdan. As a popular spectacle the classic Gaillon hill climb was a decided success, for there could certainly have been not less than 10,000 people crowding on each side of the famous hill that is known to every one who travels by road between Paris and Rouen. This gradient has always been a favorite one with makers because, being absolutely straight, it allows the cars giving their maximum effort, and for this reason there was quite a large number of entries for Sunday's contest, mostly, however, consisting of touring cars.



The experience of Gaillon has in fact shown once more that the leading firms are determined to hold aloof from the fall meetings, since there was only one French maker competing in the class of big speed vehicles. On the other hand, the foreign makers were in very strong force, and the Mercedes especially were making desperate efforts to efface the bad impression created by their failures during the past season. They entered no fewer than five cars, including three of the new type of 120 h. p. The only other big competitor was the six cylinder Napier, driven by Clifford Earp, which found its victorious career brought to an end by the victory of Baron de Caters, whose car beat the big Clement-Bayard by a second, with the Napier tying with one of the light cars for third place. A feature of Gaillon was again the excellent showing of industrial vehicles and motor cycles and tricars which seem likely in the future to be a special feature of the fall meeting, in the event, that is, of its being kept on the programme.

If the experience of Sunday goes for anything we may expect to see Gaillon maintained as a classic event, even if it be found necessary to suppress the other meetings at Chateau-Thierry and Dourdan. The prominence being given to touring trials and industrial vehicles at these meetings emphasizes once again the change which has come over the French trade. As the Automobile Club has decided that it will authorize no more racing in this country makers have no inducement to build speed machines, and in the absence of such vehicles it follows that the speed categories in the different tests will undergo a natural extinction. It has however yet to be seen how far the French Automobile Club will be able to carry out its policy of suppressing long distance races. In England the club has officially decided to follow the French lead because apparently it is unable to see what other course is open to it, and more especially no doubt because it finds that the tourist trials in the Isle of Man are a very good substitute for racing, while from a manufacturing point of view the results are likely to be far superior. Germany and Italy are not of the same opinion, for while the latter country has benefited enormously by the success of Italian cars in the races held during the past season, Germany has retrograded on account of its consistent failures, and, therefore, while the one country wishes to continue its successful racing career the other means to do everything in its power to revive racing and thus retrieve its somewhat tarnished reputation.

For this reason the proposal of Germany to convene an international conference to discuss the advisability of holding one big international race a year must be taken seriously. Certainly it is causing a good deal of embarrassment to the French Club. This body has requested the German Club to postpone its proposed conference until after the annual international conference, which is held in Paris during the show in December. Seeing that England is already sufficiently served with its tourist trials I do not think that it will be particularly anxious to back up Germany in the agitation for an international race. Therefore, the only strong support that country is likely to receive will be from Italy, and in a smaller measure, perhaps from Belgium, because the holding of one big race would imply the suppression of the Ardennes contest. On the whole, I do not think that Germany will succeed in its attempt to revive a race on the Bennett lines, and that the status quo will be maintained with the races in the Ardennes and over the Bressia circuit, in which French and other makers will be at liberty to compete if they feel it to their interest to do so.



Meanwhile France is entirely occupied with the development of its industry upon a purely practical basis. The two great events for next year are to be the competition of touring cars around Europe and the race for pneumatic tires, both of which offer so many difficulties in organization that it will probably take a considerable time before all the details are satisfactorily worked out. The task of providing a basis for the touring trials is being left to the manufacturers, who are considering various proposals for classifying the vehicles. They have at present three formulae under consideration, one in which the power varies proportionately to the bore of the engine, another in which the power varies according to the cylinder capacity, and the third in which the power varies proportionately to the surface of the piston and the square root of the stroke. So far as the carriage bodies are concerned, it has already been decided to adopt the spider body with hood for the first category, the double phaeton with canopy for the second category, and the limousine for the third category. Each passenger must carry thirty kilos of baggage, which, however, may be made up of tools and accessories if preferred.

Another instance of the effort being made to develop the practical character of automobiling is seen in the number of competitions and demonstrations that are being organized for the forthcoming show. There is to be a competition of motor cabs and other motor vehicles for town use which

ONE OF THE BUSSES THAT COMPETED IN THE FRENCH HILL CLIMBING CONTESTS.

Digitized by Google

TYPES OF COMMERCIAL VEHICLES IN THE FRENCH HILL CLIMBING CONTESTS.

will have to cover a course of sixty miles in Paris accompanied by official observers. A big demonstration is also to be made with industrial vehicles, when all the different firms will assemble their 'buses and trucks outside the Grand Palais and then go in procession all over Paris. Seeing that there may be some hundreds of such vehicles it is obvious that such a demonstration must have excellent results in impressing the public with the importance of this new and promising branch of the industry.

Among other competitions is one for self-starters, for which a prize of $2,000 is being offered. This competition is the outcome of the recently formed Academy of Sports. Possibly you may not have heard of this Academy of Sports, and even in Paris there are not many people who know of the existence of this body, although the forty "Immortals" who compose the Academy would probably be greatly aggrieved if they were told that they were not such an important factor in the automobile movement as they believe themselves to be.

It occurred one day to a well known motor journalist to create this body on the lines of the French Academy, with the same number of forty life members and empowered with the same autocratic judgment on everything connected with the sports it is supposed to represent. The promoter of this new academy did not have any difficulty in getting around him thirty-nine spirits having the same magnificent ideas of their own importance as himself, and while some of the appointments are certainly justified it is difficult to see by what claims others can have found a way into this august body except on the assumption that the academy is a sort of friendly mutual admiration society. One of the most distinguished members is M. Henri Deutsch de la Meurthe, the well known gasolene millionaire, who has offered the prize of $2,000 for the best device allowing of the motor being started from the seat. Of this sum one half will be offered for the best device presented at the show in December next, and the remainder for a similar competition in December, 1906. The device must be of a mechanical character, and will be tested on cars with motors of at least 20 horsepower.

As They do it in Japan.

As in everything else the Japanese have adopted Occidental standards in compiling their patent legislation and the Japanese law in addition to providing for the issue of patents also protects patterns against imitation and infringement. The law is similar to the German "Gebrauchsmuster-Schutz Gesetz" which boiled down simply means "design patent law" or literally "usual sample protection law." This extends protection for three years and may be renewed at the expiration of that period; its enforcement is said to have had a very beneficial effect upon the makers of things "made in Germany" who pirate their competitors designs, but unfortunately it does prevent stealing that of outsiders.

According to the Japanese law no article can be protected, a description of which has been published in the Japanese papers, or that has been used in the country before application. The latter must be made through accredited patent agents and the article undergoes a careful examination by the Patent Office. Protection is only extended to new ideas but adaptations or combinations of existing articles are admissible. In fact it must not have an original basis which should be made the subject of a patent proper. Infringers are severely dealt with, not only by fines but also by imprisonment.

Sweden in German Hands.

In Sweden the automobile business is said to be almost entirely in the hands of the Germans, although several local firms have begun the manufacture of low priced machines, and not a few American runabouts are to be seen in use. The Swedish users, having had but little experience with the more expensive types of machine, have come to the conclusion that $600 is about the limiting price for a motor car. Consular reports are authority for the statement, however, that as the members of the wealthier classes are beginning to take an interest in the movement, there is ample opportunity for a good business in high grade cars, provided it be carried on liberally, allowing plenty of latitude for demonstrations and instructions to intending purchasers, and arranged so that there should be little or no delay in the supply of spare parts. Stockholm, Gothemburg and Malmo are said to be the most likely towns, while Norrköping is a rich industrial centre which offers good facilities alike to the maker and dealer.

Here's the Automobile Skate.

According to a recent cable report, a young Swiss engineer is said to have successfully evolved the "automobile skate," or "motor boot." It consists of a pair of stout boots, weight not given, each of which is mounted on a miniature automobile running on four wheels of about a foot in diameter. The two work independently of one another, and should one break, the other is said to be capable of carrying the traveller along without any difficulty. It is claimed for the new invention that an average speed of twelve miles an hour is possible over country roads all day long without undue fatigue on the part of the operator.

Offsetting of Cylinders.

Speaking of the growing practice of offsetting cylinders in motor car construction, a foreign print is authority for the statement that the following ratios have been adopted by the leading Continental makers: Length of piston 1.1 bore; length of connecting rod, 2 stroke; amount of offset, .6 stroke. This enables the designer to use a connecting rod somewhat shorter than is common practice, thereby reducing the height of the motor, without losing anything from the increased angularity of the rod.

The Winton Motor Carriage Co. is preparing to erect a one story frame building, 85x 45 feet, at its plant on Berea Road, Cleveland, Ohio. It will be used as a restaurant for the company's employes.

FOR THE MOTOR POLICE

New York to Purchase Twenty More Machines and not Solely to Chase Scorchers.

In his budget for the coming year, Police Commissioner McAdoo, of New York, has included a sum to be expended in the purchase of twenty motor bicycles for the use of a detail of the men of his force. This comes as a result of a considerable experiment which he has already carried out in the department, and from which he has come to the conclusion that certain of the work of the police can only be accomplished by means of a motorcycle squad.

Primarily, the work of the motor police is in checking overspeeding on the part of reckless and incompetent automobilists, and for this work the equipment is absolutely essential. Also, for the more general work of the traffic squad in the boulevard and suburban districts the motor bicycle patrol is placed at a great advantage over the ordinary cavalry police. That there is also a growing need of a motor police for the pursuit and arrest of those of the criminal classes who are availing themselves of the motor car as a means of carrying out their evil designs is perhaps a new idea, but one which is nevertheless perfectly patent. Says one of the great dailies in discussing the subject:

"There is much startling evidence to prove that an entirely new class of criminals, quick to appreciate the possibilities of the automobile, is making of them a very dangerous weapon. Already autos have been held up by up-to-date highwaymen skilled in the use of the machines who are capable of carrying off their booty. To the burglar, again, the automobile offers a most effective means of escape. A thief running through the streets at once attracts a crowd; the same man comfortably seated in an automobile, may escape at much greater speed, safe from suspicion or pursuit in the most crowded streets. As the mechanism and control of automobiles becomes more familiar the number of thefts of these machines is certain to increase. Any criminal who can control such speed as the automoble affords suddenly gains a dangerous advantage in carrying ing out a great variety of crime.

"The considerations of the advantage that the control of this dangerous weapon lends to criminals have led many thoughtful people both automobilists and others, to favor an increase of the automobile police squad. The means of rapid locomotion obviously should be in the hands of the police as well as of the citizens, whether they be honest or dishonest. The fact that there are some twenty-three thousand automobiles in New York State alone at the present time renders such considerations of the greatest importance."

Certainly the methods of the detection of crime and the arrest and conviction of the offenders should keep pace with the nature and method of the offence, and, granted the use of the motor car to those whose intentions are illegal, then the police should as well be provided with an equaly advantageous means of following up the evildoers and bringing them to the bar of justice. Up to the present time the only apparent use and need of a "motor police" has been in the checking of the unlawful speeeding of automobiles. For this purpose there is doubtless a considerable need of men who are equipped suitably, but the matter of excessive and unlawful speeding seems to be one which will take care of itself in the course of time, and, with the education of the motorists to a realization of what constitutes careful driving, and with the education of the lawmakers to an understanding of the statutory needs in this respect.

In the matter of street patrolling and the overtaking of escaping criminals who are thoroughly up to date in every respect, there is and ever wil be an imperative need of a good and efficient patrol, which is equipped in such a manner as to enable it to cope with any emergency which may arise, and to cope with it forcibly and effectually.

Tudor Farm as a Rendezvous.

To meet the needs of automobilists of Providence, R. I., and Boston, Mass., who desire an objective point on their runs through that section of New England, the Tudor Farm Motor Car Club has been formed, with 150 charter members. The clubhouse, which is ideally located on the shores of Lake Walourslopoag, in West Sharon, two miles from Sharon, is the first of its kind to be established in Southeastern Massachusetts. It is situated midway between Boston and Providence, on the straight road between those cities. Ninety acres of land surround the clubhouse. Dorsey L. Greene, of Boston, has been elected president; Amos H. Whipple, of Boston, vice-president, and Emil Camus, of the same city, treasurer.

New York Central's Automobile Cars.

The New York Central Railroad is building two cars expressly to transport automobiles, and to be attached to passenger trains only. Considerable demand has arisen for such equipment when persons going to and from country places wish to take their automobiles on the same train with them. The cars for automobiles will be of the general design of the road's baggage cars, except that a round top roof will be used and a door seven feet wide and eight feet high will be placed at one end of the car.

How It Helped the Hunters.

Instead of waiting for a train which usually arrives at a time the shooters do not want it, members of the Kubler Gun Club, of Mount Eden, Cal., have decided to use the automobile hereafter on hunting expeditions. The experiment was tried last week with a steam car, and whether the car caused luck is not said, but the seven hunters returned at night with 350 ducks.

MOTORPHOBES IN SESSION

The New Jersey Brand Hears a Truckling Motorist Favor Higher Fees and Large Numbers.

Another step was taken last Friday night in the movement inaugurated by the Anti-Automobile Association, at North Branch, N. J., for the purpose of curbing automobilists, reckless or otherwise. When Colonel Joseph S. Frelinghusen, of Raritan, who owns an automobile, was nominated by the Republicans for State Senator, and Senator Samuel S. Childs, of Bernardsville, was renominated by the Democrats; there came the rub, as the association had previously determined not to support any candidate who owned an automobile. However, the members determined to hear just where each candidate stood on the automobile question and invited them to address the association. Senator Childs will be given his opportunity at a later meeting, but last Friday night Ruppel's Hall, the headquarters of the motorphobes, was filled to hear Colonel Frelinghuysen.

He declared he owned an automobile, but favored any reasonable means to prevent careless automobilists from reckless speeding. He said he believed it would be a good plan to have automobilists when they take out a license to pay a much higher fee than at present; that the number should be on the back, higher up and in larger figures, as well as on the front of the machne.

Irving Hoagland, of Franklin Park, the Republican candidate for member of Assembly, also spoke. He said he thought that before a new automobile law was made the present one should be enforced. He believed it would be a good plan to place officers at certain limits, let them have signals and take out their watches and time the automobilists. If the drivers exceeded the rate of speed permitted by law, let the signal officers have the power to arrest them without a warrant.

Would Have Banners, Not Tags.

Out of the Middle West, Indiana, the State that is noted for its authors and poets as well as other products of the soil to be particular, comes the suggestion that the usual number-bearing placard should be done away with, and in its place a "banner with strange device" substituted. To quote the sponsor of the scheme, who is hopeful that the next sitting of the assemblage of State Solons may consider his system favorably and enact a law accordingly, "a red flag or banner, square, diamond, round or triangular for each automobile—to stand up three or four feet above top—different automobiles to have different colors or combinations of colors and different shapes." The reason given is that such adornments could be seen much further than the numbers, "which are hung so low on the machine as to be wellnigh out of sight."

THE INDUSTRIOUS CHAUFFEUR

The Shattering of His Dream that Came in Sudden and Saddening Fashion.

By the explosion in Chicago one day last week of an apparatus designed to revolutionize the running of automobiles, Henry Brown's hopes, his body, his apparatus and a valuable touring car were rudely shattered. Incidentally, another man was kiled.

Long ago, twenty-four months, in fact, Brown entered the service of J. Finlay Barrell, a Chicago stock broker, to act as his chauffeur. When Henry was a little chap in knee breeches attending school he always had a knack for inventing things, and his doting teacher prophesied for him a brilliant career. Naturally such a plebeian occupation as a mere driver of an automobile did not satisfy Henry's lofty ambitions. He would yet be a great man, and some day, perhaps, posterity might gaze upon Henry Brown's picture in the Hall of Fame. Such is the ambition of every inventor.

Henry's invention was one designed to reduce the cost of motive power for self-propelled vehicles to the minimum, and by the use of acetylene gas in a little machine, of which he alone knew the secret, speed could be increased 100 per cent. As Mr. Barrell did not keep Henry busy as a chauffeur he had lots of time to apply to the perfection of his invention. His plan promised much; it was just the thing. Thus said a few fellow drivers to whom he unbosomed himself.

In the arrival of a special car and the plans for a final test Brown saw emancipation from his "dog's life," as he expresesd it, and several friends visited him in the morning and congratulated him upon his success, for had not "Henry Brown, inventor," said it could not possibly fail?

Brown's employer had not, however, been so sanguine of his employe's success; in fact, he considered the contraption dangerous, and had forbidden experiments in the garage, but, as all the world knows, a mere rebuke or the like will not deter or dissuade an inventor from his purpose. Somehow or other the cruel world never seems to take the majority of revolutionists seriously. It is the latter's misfortune, perhaps.

The momentuous day had at last arrived when Henry Brown would prove to the doubting Thomas—otherwise his employer—that he had a "good thing" and would not hereafter be dependent upon J. Finlay Barrell for a living. Brown had set the machine up with the aid of an aged negro named Powell, and was just screwing the last nut on when a loud explosion shook the building. When the smoke had cleared away Powell was found outside the garage with one leg completely severed from his body, and Brown lay still by the debris, clutching in his hand a wrench with which he had turned the last screw which marked the completion of his work. His left eye had been blown out, his right leg was broken and his side was lacerated and bleeding where a piece of splintered steel from the cylinder had entered his side. Barrell's car was blow to atoms. Powell, the negro helper, died a few minutes later.

In view of this, it is not likely that the wonderful invention will be placed on the market except through the columns of some joke purveyor.

Motor Cars in Greece.

United States Consul Horton, of Athens, Greece, has the following to say concerning the demand for self-propelled vehicles in that part of the world: "There are twelve automobiles in this consular district, or, to speak more definitely, in the city of Athens. Three of these belong to the King and the princes. His Majesty's automobile is quite a luxurious affair, and is said to have cost some 20,000 francs ($3,860). That owned by Prince Andreas was presented to him by the Czar of Russia. Most of the automobiles in use here were bought in France at a cost of from 4,000 to 10,000 francs ($772 to $1,930). Three new ones are now on their way to this country.

"Automobiles are classed by the tariff law as four-wheeled carriages, which, upholstered or not, used or unused, pay a duty of 300 francs ($57.90) each, besides octroi, etc. In the case of a high-priced carriage, with sumptuous furnishings, duty is assessed on value declared in invoice and bill of lading, and importers are advised to obtain an invoice from the Greek Consul in the country from which the shipment is made. In this latter case the duties are 20 per cent of the assessed value, $25 octroi, and 5 per cent on the 20 per cent. Parts or accessories to autos pay according to their assessed value. Automobiles are classed as carriages for the reason that machinery is admitted into Greece free of duty."

Akin to "Rocking the Boat."

Always it is wise to take the advice of the looker-on with the proverbial grain of salt, as witness the recent incident at a London garage in which a friend of a chauffeur insisted in pouring gasolene over the mechanism of a car which he was cleaning with kerosene "because it was quicker." The chauffeur was working in a pit under the machine at the time, and before he could get out of his trying position the whole outfit was a mass of flames, and the man was so badly burned as a result that he died within a short time. At the inquest the friendly chauffeur, whose name was Smeltz, said that he had not thought of the possible danger. That, however, did not in the least affect the result.

Greasing the Steering Gear.

Although it is not readily accessible in most cars, and although it requires but little attention, the driver should not neglect to force a syringe full of grease into the steering box once in "about so often"; it insures the proper and sufficient lubrication of that most important organ.

IN FAVOR OF MOTOR BUSSES

London's Traffic Commission Sees Good in Them but has to Resort to an "If."

In the report of the advisory board of engineers to the London Traffic Commission, which has just been made public, several interesting points are brought out. The action of the committee in not more favorably reporting on the motor 'bus question, which is agitating Great Britain at the present time, has been widely censured, but it appears that, although the report of the commission did not bring it out clearly, the engineers were favorably impressed with the performance of the mechanically propelled 'bus in contradistinction to that drawn by horses.

In fact, they even went so far as to point out that in practice the speed attainable by the motor 'bus exceeded that of the older types and approximated that of the tram lines. The following figures were quoted in proof of the assertion:

Speed in miles per hr.	Rush hours.	Slack hours.
Horse omnibus.....	3½—6	5¼— 8
Electric tramway....	5½—7	8½—11½
Motor omnibus.....	6½—8¼	8⅛—11½

The committee also framed the conservative opinion that should it be found that vehicles of this sort could be worked and maintained at the speeds quoted, it thought that they would come to have an important bearing upon the transport of passengers in London, and might effect the consideration of railway and tramway policy.

In regard to the real work of the commission in seeking some means of relieving traffic congestion, some very pertinent suggestions were brought out, particularly with regard to the municipal policy which chooses wide junctions and "circuses" for the erection of various obstacles to traffic such as the entrances to underground lavatories, statues and lampposts of unnecessary size. Also the policy of splitting up the highway into two narrow lanes by the erection of trolley posts and lamp poles, as well as cab ranks was heavily scored.

There is meat for reflection in the two points here brought out, and room for its application here as well as in the English metropolis. The motor 'bus must, sooner or later, make its appearance here as a successful institution, but the streets must be cleared of traffic in order to make room for it.

Improving the Hammer Handle.

Cut a three-quarter-inch piece out of the handle two inches from the hammer head. Slot each end of the cut to receive a piece of spring steel three-thirty-seconds-inch thick and as wide as the handle. Fasten the steel with rivets. The extra work requires but a few minutes longer and well pays for the trouble.

"INSIDES" OF THE MAGNETO

Not the Puzzle that Many Persons Fancy it to be—Just How it Operates.

Reams of paper and barrels of ink have been expended on explanations of the workings of the magneto, and the end is not yet in sight. Despite it all, the first question of the novice is, How does it work? and What are you going to do with it if it breaks down on the road? It is not too much to say that to the majority of motorists, many of them otherwise well versed in the principles of high tension ignition, the magneto is a deep and unfathomable mystery, and doubtless will remain so in the case of those who are willing to let it go at that.

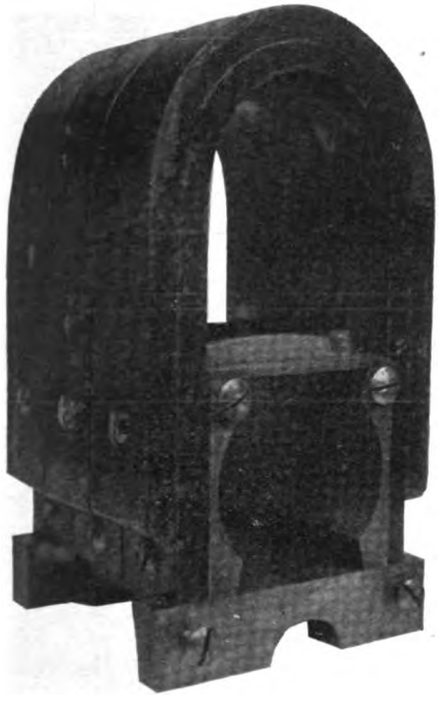

Fig. 1.

The subject is of particular interest at the present time owing to the increasing adoption of the magneto; such, for instance, as the installation of the Eiseman high tension system as a standard feature of all 1906 Packard cars; and those who are anxious to know what sort of mysterious "innards" are concealed by the compact looking arrangement alongside the engine that seldom comes in for much attention, so long as it continues to operate as it should, will be surprised to learn how simple it is in reality. Doubtless the man who confesses to such a depth of ignorance on this point is equally dark as to what happened when he turned the crank on one of the old style telephones. Concealed within the box was nothing more or less than a small magneto of identically the same construction as those employed for ignition purposes. The crank turned a large gear, which meshed with a much smaller pinion on the armature shaft of the magneto, and the current generated by the rapid turning of the latter rang the bell at the other end of the line.

Owing to no attempt being made to centre the entire ignition system at one point by placing both primary and secondary windings on the armature, the Eisemann is considerably less complicated than other high tension systems which incorporate synchronous generation and distribution. As its groundwork it embodies a replica of the small telephone magneto just referred to, but in a somewhat larger and more powerful size. This is, in short, the simplest type of electrical generator ever invented, and its design dates back to the very dawn of the discovery of the generation of electricity by mechanical means. It consists of the permanent magnetic field composed of three compound magnets which are but enlarged copies of the horseshoe magnets familiar to schoolboys. These are made of a special quality of Tungsten steel, which possesses the peculiar property of retaining magnetism to a greater degree and for a much longer time than almost any other steel known. Heat and vibration both affect the retention of this peculiar force in the steel, and unless the latter be of the proper quality the strength of the field will diminish perceptibly, often within a few months. This was one of the great drawbacks present in the low priced magnetos turned out in this country a few years ago for automobile use. They started off first rate, but in some mysterious manner—that is, to the uninitiated user—they seemed to "die," and sooner or later became utterly useless. They were accordingly discarded in disgust in favor of a return to the battery, whereas the only thing needed was remagnetization of the field; but owing to the material used the process would have to be repeated once or twice a year to insure constant operation.

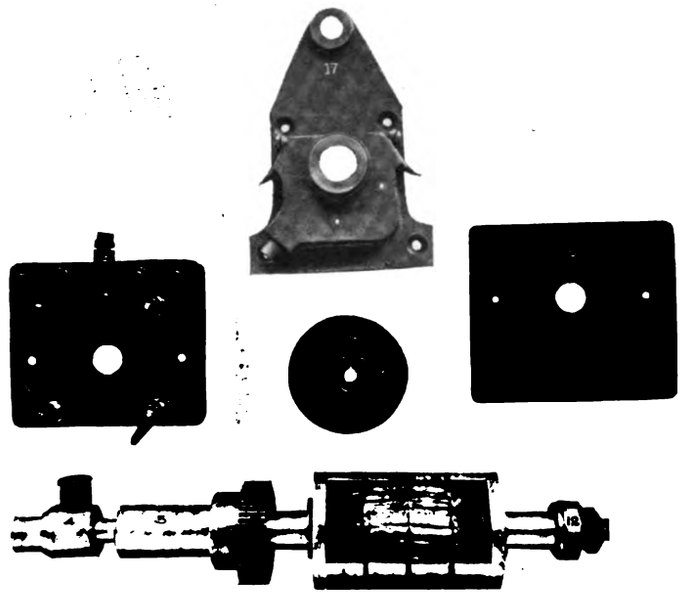

Fig. 2.

Experience with this type of machine, which was placed on the market at a price far below that at which a magneto suitable for ignition purposes can be turned out, made builders sceptical as to the value of the magneto. It is not too much to say that the power of the Eisemann machine took American designers by surprise upon its advent in this country in 1902, and the majority were frank to express their disbelief in its lasting qualities. The magnets were "supercharged for exhibition purposes," according to many, while some were of the opinion that the generator of its size that would produce such a current at such slow speed had never been built, and that it was in some unseen manner connected up with the electric light mains, à la Keeley motor.

The next essential of the machine is the armature, which is shown complete at Fig. 2. This consists of a single winding of coarse wire on a soft iron core of the Siemens H or shuttle type, the first of its kind invented.

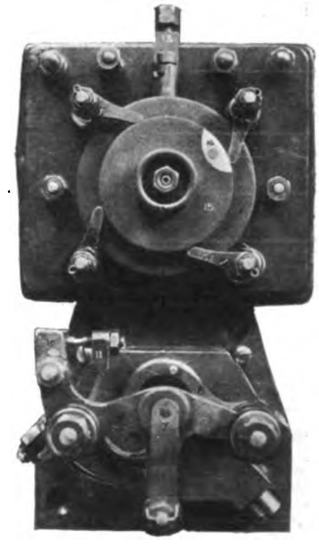

Fig. 3.

As illustrated, this also includes the pinion 3 for driving the secondary distributor 15, as well as the device for advancing and retarding the time for ignition, consisting of a key or block travelling in a spiral on the inside of the sleeve, 5, from which the drive is taken either by gearing direct or through sprocket and chain from the cam shaft. The forked end, 4, of this arrangement takes the end of a rod leading to the ignition lever on the steering wheel. Moving this causes the key to shift back and forth in its spiral path, thus rotating the sleeve and giving the armature a fraction of a turn ahead or backward, thereby changing its position with regard to the time of occurrence of the spark. The current generated by the armature is collected at the point, 6, which is a copper disc terminating an insulated wire that is led out it through the hollow shaft. A small cylindrical carbon brush, about half an inch long and the diameter of a lead pencil, slides in the yoke, 9, Figs. 3 and 4, which is insulated from the rest of the frame and is held in place by the spring, 7. The left side of the yoke, 9, is continued upward and carries an extension,

10, provided with a screw and heavy platinum point; against this bears a similar point carried on a rocker arm, 12, also shown separately, pivoted at its centre and actuated by the cam, 11, Fig. 5, shown also on the end of the armature shaft in Fig. 3. The rocker has

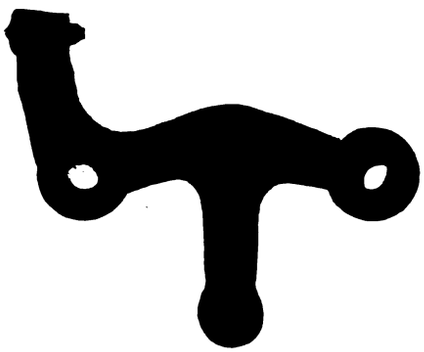

Fig. 4.

Fig. 5.

Fig. 6.

a roller on its lower end, which is struck by the cam as it turns. In order to insure a good connection the small piece, 8, Fig. 6, carrying two platinum points, presses against the inner face of the cam. Thus the armature is said to be "short circuited," or closed, except when the cam depresses the rocker end, separates the platinum points and permits the current to flow through the primary winding of the induction coil.

This occurs at what is known as the point of "maximum inductive effect," that is, when the current induced in the armature winding by passing it before the strong magnetic poles of the field is greatest. This happens twice in each revolution, or as the metal faces of the armature as shown in Fig. 2, enter and leave the embrace of the recessed pole pieces shown in Fig. 1, which is termed "cutting the lines of force of the magnetic field." Accordingly, the cam opens the circuit twice per revolution. This is done in order to obtain a self-inductive effect, which is the surging flow of current occasioned by suddenly breaking a highly magnetic circuit; the same thing that is guarded against at the trembler of a vibrator coil by the use of a condenser, as it tends to reduce the speed of the latter as well as to burn the platinum points.

The current generated is alternating, and accordingly the single coil used is of the non-trembler type, and may be placed in any conveniently-out-of-the-way location on the car, as it is not necessary to get at it. One terminal of the secondary winding of the coil is grounded on the engine frame, as is customary in all high tension systems, and the other is led to the distributor, which in the Eisemann is located directly above the contact breaker, Fig. 3. This wire is carried to the binding post, 13, which is a hollow brass cylinder containing a cylindrical carbon brush pressed against a metal ring on the disc of the distributor, 15. The latter is keyed to the secondary shaft of the magneto, and is made of solid vulcanite, with the exception of a brass sector, 16, which opens a path to the plug of each cylinder in the proper order as it passes under the four steel fingers shown bearing on it, in Fig. 3. The latter connect with the four binding posts shown in a line acros the top of the insulating panel which carries this part of the mechanism, and from which the wiring is taken direct to the plugs.

The simplicity of the wiring is one of the chief advantages of the system, and while, as described, it may be difficult for the novice to follow, this will be easy in the appended outline sketch of the connections. (See Fig. 7.) For the sake of clearness, the grounded terminal of the secondary winding of the coil, S, is shown leading to each cylinder, though in practice this is grounded at but one place on the frame or engine. The drawing shows the system reduced to its lowest terms, in order to make it easily comprehended. The armature and its connections, as already explained, are represented by A, while the circuit breaker mechanism and connection with the primary, P, of the induction coil is shown by the cam, C. In practice there is but one wire leading to the primary of the coil, the return being effected through the grounding of the armature winding on the machine and the bolting of the latter to the engine. It will be seen that the setting of the cam on the armature shaft is made with relation to the position of the brass sector on the secondary distributor disc above it, so that just as the latter is passing under one of the fingers communicating with a plug of the cylinder, the cam is opening the circuit and

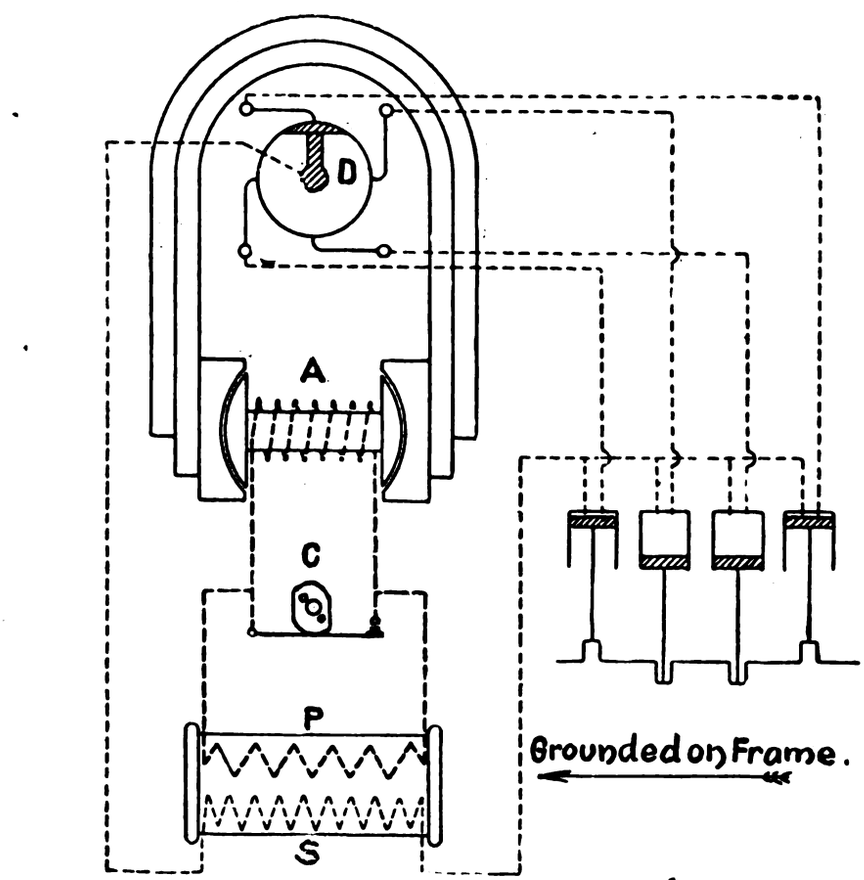

Fig. 7.

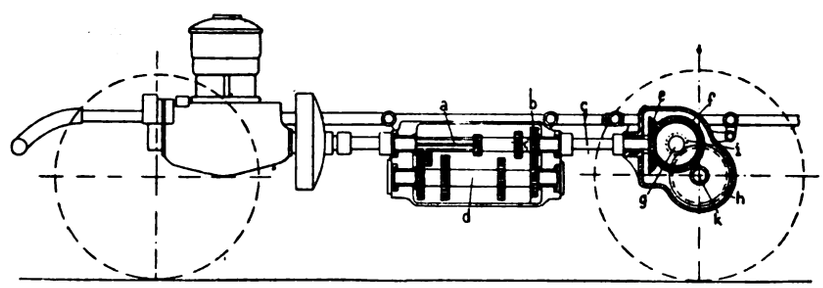
Digitized by Google

sending the current through the primary winding of the coil. As there are two high points on the cam, this is done twice for every revolution of the armature, which gives but one secondary impulse per turn as the distributor is geared to run at half the speed. The magneto itself must accordingly run synchronously with the engine, and as it is timed with the latter a direct form of drive, such as gearing or sprocket and chain, is imperative.

A word as to the most likely places to look for trouble should the machine apparently refuse to work will not be amiss. It must be borne in mind that two of the chief connections, that at 6 and 7 in the primary and at 13, Fig. 3, on the secondary distributor disc, are made through the medium of small carbon brushes. While this is a practical method for the purpose, these small pieces of carbon are apt to wear; cylindrical carbon sticks are an extremely common article with the electrician, and it is not difficult, with the aid of a file or emery, to replace these brushes from a stock piece of material, but it is advisable for convenience sake to carry spares, which cost but a few cents. When worn down far, these brushes will not make contact and need renewing, but they may sometimes give trouble; this on the primary, through being doused with oil and forming a glaze over the end of the brush, or again at the latter place, dirt or other foreign matter may find its way between the brush and its contact, although this is well guarded against.



Such things are not apt to disturb the secondary owing to its high tension. Permitting moisture to get on the distributor disc, 16, or its support carrying the terminals, is apt to cause the current to leak or jump from one to another. The result of long wear on the large platinum points of the circuit breaker, or of the derangement of the cam and rocker, may cause a cessation of operations at this point, which is, however, very unlikely. As the machine is made with ample sized bearings, and has liberal provision for lubrication, besides being very substantially put up in every particular, the foregoing practically sums up the ills to which it may be subject, and of these none but the first should happen, and that not more than once in a season. It goes without saying that a little intelligent supervision should prove an ample preventive for any, as inspection will show when the brushes have worn down and need replacement. The armature is solidly enclosed in what is practically a hermetically sealed case, so it is immune from harm. The parts shown in Fig. 2, not already mentioned in detail, are 17, which is the end plate carrying bearings for both shafts, with a grease box and wick lubricator on the armature shaft, and 18, which is a backing of heavy fibre placed behind the panel, carrying the collector fingers and terminals to insulate it.

Differences between union conductors and motormen of the street railway line in Paducah, Ky., and the company, because of the employment of non-union men, have led to a general strike. The union men will start an automobile service in opposition.

REDUCING SHAFT STRAINS

How De Dion-Bouton Have Answered Some of the Demands of the Bevel Drive.

It is a recognized principle in the design of cardan drive mechanism that the alignment of the various parts shall be such that under conditions of normal spring deflection the driving shaft shall be as nearly as possible in a straight line, so that the frictional resistance which comes with the working of the elements of the joints may be reduced to its lowest possible amount. Ordinarily there are but two methods of approximating the desired result, the first being to arrange the entire power plant on an incline plane running from the transverse centre of the motor to the centre of the rear axle, and the second being to keep the engine and transmission gearing level, but to lower it so that the angle of the drive shall be reduced as much as possible.

To reach the desired end by the latter means, which is the more commonly employed of the two, involves lowering the motor until its crank axis coincides with the axis of the rear wheels. This, however, though practically achieved in certain machines, so reduces the road clearance of the car that it is rendered of little use for touring purposes in many localities, and for this reason many designers are content simply to approach the desired end without actually attaining it.

A method of overcoming the difficulty of combining a motor which is rationally high up in the frame, and at the same time securing a driving shaft which is in concentric action under normal conditions, has just been perfected by the French house of De Dion Bouton. This, though introducing an extra gear shaft and pair of gears, nicely accomplishes the desired result, and at the same time does away with the inordinate strains which are usually put upon the live axle through the side thrust of the bevel driving gears by using a spur gear drive for the differential.

The system, which is here shown diagrammatically, utilizes a three forward speed transmission, direct connected on the high gear, which has the lay shaft placed beneath the driving member. As shown in the cut, successive positions of the sliding member upon the shaft, A, give the various speed ratios through the lay shaft, D, with its gears, and the pinion, B, which is fast upon the cardan shaft, C, culminating with the coupling of the sliding member with B, for the direct drive. The bevel gear, E, fast to shaft, C, meshes with another, F, of sensibly equal pitch, which is keyed to a short transverse shaft G. Upon the same shaft is also mounted the pinion, I, which meshes with the gear, H, surrounding the differential casing. The gears, E, F, I and H, are all inclosed in a casing made integral with the rear axle construction.

In this way the ratio of the gears, I, H, being varied to suit the taste of the designer, and their size determining the height of the driving shaft, the direct drive is proportioned to suit the power of the engine, the cardan joints are relieved of all work under ordinary conditions, and the side thrusts of the bevel gearing are transferred from the differential mechanism to that of the smaller shaft, which is especially adapted to withstand it.

To Keep Tools in Order.

One of the greatest perils of motoring within city limits is that from skidding on wet and greasy pavements. Frequently a machine which will answer true to the steering wheel on perfectly dry or perfectly wet streets develops most erratic tendencies on the same turns and when driven at the same rate of speed on a slightly wet surface. In this connection, it is well for the driver to bear in mind that no matter how great the virtue of this or that anti-skidding device, the only sure preventive is slow speed.

One of the commonest habits of the careless or indifferent driver is to jumble his heterogeneous collection of tools and repair parts in a box or roll-up case, and let them rattle as they will. Apart from the risk of damaging such parts as extra valves and spark plugs when carried in this haphazard manner, there is always more or less trouble experienced in finding the particular tool needed when occasion arises.

If a proper box with partitions for the different tools is not fitted, the extra parts should be wrapped in cotton waste or rags and carried in separate receptacles such as cigar boxes. Washers and nuts may be strung on copper wire, while the larger tools, such as spanners, wrenches, files, hammer, screwdriver and the like, are best carried when rolled up in a stout piece of cloth which should preferably be fitted with pockets for each article so that they cannot shake loose.

Complete outfits of tools for this purpose are now put on the market in cotton lined leather rollers of this kind, but in the absence of such an aid, if the cloth be tightly wound over and over so that no two tools touch, the package can be completed by strapping or tying, and it may then be placed anywhere without danger of rattling, or it may be placed in the tool box on some waste without the preliminary of fastening.

MAKING GEAR SHIFTING SURE

British Device that Automatically Controls the Lever and Prevents Slipping.

One of the most persistent difficulties which the beginner has to overcome in learning the operation of a car which is fitted with a sliding gear transmission, in which the changes are effected by means of a lever sliding over a notched segment, is that of overreaching the proper positions of the lever in making the changes so that when the clutch is let in the gears are found to but partially in mesh. Frequently when the tyro is nervous the lever is carried beyond the proper point to such an extent that the gears reach the neutral point, and under such circumstances the result is exceedingly trying both to the ears and to the mechanism as well. With the so-called selective system there can be no danger of doing this, as the movement of changing the gears is absolutely regulated by the gridiron.

In order to secure the positive action of the selective system without the added complication which it entails, an English inventor has recently perfected a mechanism by means of which the gear shifting lever is automatically stopped when the gears are in proper relation for each drive, and which will not permit of its being again moved until the pawl handle has been dropped and again raised, thus doing away with all possibility of slipping through the gears into neutral inadvertently.

In this mechanism, which is outlined in Fig. 1, the latch, B, instead of being permanently attached to the pawl rod, A, is shaped at its upper end to engage the catch, C, which is hinged to the lower end of the rod. Normally this catch is held in line with the rod by means of the flat spring, D, which is fixed to the lever, but upon its being pushed to the right it releases the latch, allowing it to be drawn downward by the spring, E, Fig. 2. A short lever, F, pivoted in the main lever has a projection at one end, while at the other is an adjustable screw adapted to press against the catch and release it when the part is moved. These parts are all attached to the main lever and move with it, except that the latch, B, is released by the lever, F, when the latter is moved and thereby freed from it. The segment used is like that used ordinarily, except for a set of supplemental notches cut into the side to correspond with the regular notches on the top. Into these supplementary notches the lower end of the lever, F, drops as the latch is seated, and by this means allows the catch, C, to grasp the latch. As the main lever is moved toward its next position the lower end of the small lever, F, is pushed outward by the segment, which is shaped for the purpose and acts as a sort of cam, until it releases the catch, C, by pushing it to the right, and thus allows the latch, B, to be drawn down upon the top of the segment by the spring, E. As the lever reaches the first notch in order it drops into it, locking the gears in position. In order to again alter the position of the lever it is necessary to release

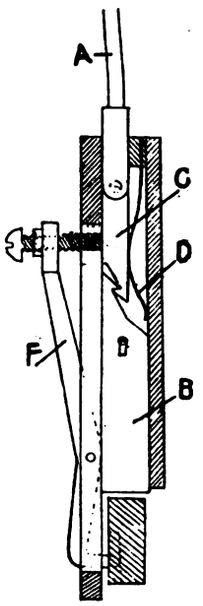

Fig. 1.

the pawl handle, when the spring, G, Fig. 2, draws it down and allows the catch, C, again to engage the latch.

By this means the choice of position for the lever is taken entirely out of the hands

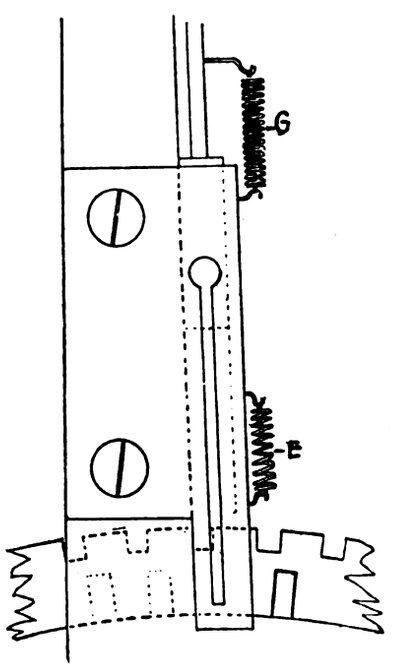

Fig. 2.

of the operator, and all that is required of him is to move it until the latch brings up in the notch, when he must release the pawl handle in order to further change its position. The device is ingenious, and should be of especial value to beginners, while it may also serve to remove a considerable source of worry from the mind of many an older and more experienced driver. That it will work to advantage there can be little doubt, since it is in principle the exact counterpart of a scheme which was used for several years upon an American car which has since become obsolete.

Hindley's Steering Gear.

Although now generally accepted as the standard mechanism for automobile steering gears, the worm and segment as generally constructed is open to several objections, chief among which is the tendency to inordinate wear with its attendant backlash. This is in a measure due to the materials used in the gears, but is perhaps equally as much the fault of the design. In the Hindley steering gears, which are made by Morse, Williams & Co., of Philadelphia, Pa., all likelihood of trouble from either of these sources is avoided, first, by the use of "forty-carbon" forged steel stock in the gears and Parson's manganese bronze in the casing, and, second, by using the Hindley spirals. In contradistinction to the ordinary straight cut spirals, the Hindley gears have concave faces, flat contact surfaces, and have also three times the actual wearing surface and have absolutely no backlash. These gears have also been used to advantage in driving the two-to-one shafts of gasolene engines.

Pittsburg's Non-Puncturable Tire.

Another "absolutely punctureless" automobile tire has been presented to the public with the best wishes of the inventor. This one comes from Pittsburg, and is the production of one James H. Swain. It is technically known as an armored tire, and is made by the H. M. S. Armored Tire Co., of Pittsburg. In general construction it is not unlike most of the tires already on the market, with the exception of a layer of impervious material which is interposed between the tread and the inner fabric, and constitutes the feature of the invention. This layer is made up of a series of strips of vulcanized fibre, each wound with a wrap of cotton braid and imbedded in the casing. The extraordinary toughness of the fibre is supposed to furnish complete insulation for the inner tube, while its flexibility when taken in thin strips is claimed to be so great that no appreciable loss in resiliency will be experienced from

Tightening the Babbitting.

Every now and then an inquiry is made as to the best method of tightening babbitt in a journal box. There have been ways and means exploited of doing such work, but the only best way is to run a new box and have the box hot when the metal is poured. To do a job of babbitting and have it theoretically and practically correct would call for having the box as hot as the metal, so that both might cool and shrink together. That is naturally out of the question in ordinary practice, but by keeping this fact in mind, the box should be as hot as possible when the metal is poured.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau Street, New York.

THE LADY AND THE FLY

Which Illustrates One of Those Troubled Occasions When the Sweet Thing Proffers Advice.

"Have you ever gone over the car from the rear tire to the water plug in the bonnet while the particular fair charmer who was your companion stood by and made idiotic suggestions as to what the trouble was until you felt that if you did finally get the car going the first place you would head for, would be the funny house? No? Well you have something yet to live for. Either your women friends are not of that type or your luck in avoiding breakdowns must be phenomenal when you have them along. There have been times when I was as certain as I'm standing here now that if Alice didn't stop telling me to look into that thing there, I think it's twisted" or something similar, I would eat her head off. Strike me flat if we haven't come as near to breaking it off half a hundred times as any engaged couple ever does without slipping over the line, just over some roadside derangement.

"Take women generally and they're content to sit in the tonneau and look placid while you grovel around and get yourself filthy with your temper on a raw edge. I suppose a man looks so all-fired businesslike when he gets himself covered with sweat and grease—sleeves rolled up, a monkey wrench in one hand and something equally vicious looking in the other that the dear things think you could run a whole machine shop single handed. They're annoyed at the delay, of course, but it's all in the day's outing according to their reckoning. Certain that they'll get home all right, and have a good time at that, for even if the machine does stall so that you can't get another kick out of her, why you're good for the car fares home no matter where it is—and if it's late, so much the better, for that means a dinner on you in the bargain.

"It's truly marvellous what a surpassing confidence they have in your ability to get there at all times. That is the placid, take it easy kind that I've just been telling you about, but every once in so often you strike a tartar; one of the ilk that you couldn't chain into the tonneau when you're stopped on the road. Down on the ground with a wise air, almost as fast as you are with a 'now I wonder what's the matter?' air in every move. It does beat the Dutch, some of the suggestions they will make to a fellow. They do it just about the way they back a horse—like the jockey's looks, or his colors happen to match their hats or some other equally certain way of picking the favorite every time. If I were given to losing my temper readily, I certainly would be apt to lay violent hands on a woman when she daintily holds her dress away from the wheel with one hand and with the other points to the flywheel or something else that happens to strike her fancy and tells me 'look at that thing, I'm sure there's something the matter with it.' You're trying to make up your mind whether to dismantle the carburetter or to recollect whether you filled the gasolene tank or not before starting and you don't like to go back to look at it for fear of getting the laugh. Under such circumstances the imperious command to 'look at that thing' disturbs your train of thought and almost incites you to deeds of violence.

"I have had lots of experience with trouble and trouble hunting and I flatter myself I know about where to look for it generally, but in spite of that I always believe in the crank as a sovereign remedy and I don't give up winding until she refuses to cough absolutely and I'm done up. Yes, I know it's foolish, but in spite of all the advice to the contrary and the information handed out by the technical wise ones in the papers, to always look for the cause of the trouble if the motor doesn't respond after half a dozen turns. There are occasions when I'm obstinate enough to take another whack at the crank as soon as I get my second wind and that without having tinkered with anything in the meantime. What is more, I have had the motor start when I was about ready to drop from exhaustion—such is the perversity of some of them.

"But to get back to the eternal feminine, I'll tell you the way one girl at least got the reputation of being a wise one and the joke is on me too. You remember about two month's back, we had the usual annual visitation of country cousins up at the house. Two girls—stunning lookers, both of them and their young brother. We make it a point to put in about three or four weeks up at their place in the country every summer, so its our time to look pleasant when they descend on us in the winter and of course, it's up to me to show them the sights and do things generally. Of course, the old lady comes along with them, but she doesn't count except on the theatre tickets. I had become the proud owner of a car between visits, and they were crazy to ride in an automobile. One or two of them owned up in the hamlet they hail from, but I never found out until afterward that one of them —not automobiles—but the sisters, the elder one, was crazy on the subject and had been studying and reading up everything connected with cars that she could possibly lay her hands on.

"They weren't in the house twenty-four hours before I found out my life would be a burden until I put my car through its paces for them. Took them all over the city and then the elder one got tired of 'city riding' as she put it; she wanted a long spin in the country—wanted to see what the car could do in the way o' speed.

"There was no way out of it, so I mapped out a trip to cover about a century and a half—at least they did and I had to kowtow and keep them from making it five hundred miles. Distance looks insignificant as the map grows smaller and then what does a woman care for a few inches more or less on a map. 'We might just take a run off here,' one would suggest, pointing out some spot only a finger's breadth out of the line of the circle they were trying to figure out. That's me, of course, I put up a holler first thing; began to tell them how far it was, poor roads and all that, but it didn't do me a bit of good for before I was half way through my little kick they'd have forgotten all about the place I was jawing against and have found another twice as bad. Too far, I'd start off. 'Too far, they'd all echo; just that little bit from here to there.' But I finally got them to leave it all to me and hid the map.

"With enough lunch stowed away in the tonneau to feed a man o' war's crew, we got away bright and early next morning and everything went just as smoothly as the "they lived happily ever after" end of a novel, until with a good century between us and home and only a few hours of daylight left we started back. Hadn't got ten miles before she began to miss. The motor would run smoothly for a few minutes and then begin to fire spasmodically and slow down and just as I would be quite sure she was going to die for good, each time she would pick up again and race off. The way I had to manipulate that clutch, spark and throttle all at once to keep her from laying down altogether was a caution. Once or twice I was sure she was stopped for good, but got the clutch out in time and with one or two preliminary coughs just on the last turn, off she'd start again. But there had to be an end of it and finally I didn't manipulate things just right and that was where I gave up. Tell the truth, I was glad of it for I was downright weary of fussing along at eight miles an hour by dint of working the clutch in and out to keep her going. I seldom come to earth to investigate as long as the motor will run and turn the drivers, but that was where I was glad to get down.

"Stretched around a bit without even looking at the engine, just as if I knew all about the trouble and didn't give a hang, sort of a confidence inspiring dodge and it worked. Then I got at the bonnet and lifted up one side. Nothing wrong in sight and not over hot so I started for the crank without touching anything. A turn and a half and it started off at eight hundred a minute just as nice as you please, and I straightened up and looked the part. I felt like the real thing, but before I could climb back in the seat there was a sickening halt in the regular hum, followed by spasmodic coughing and finally another lay down. We had two sets of batteries and as a preliminary I shifted the switch on the dash, although I did not know which point represented the freshest set by this time because I had shifted the switch back and forth a dozen times when the trouble first appeared and before we had to get down to look for it. But it looked business like and I clutched it by priming the carburetter before taking another shift

AN INCIDENT OF A TOUR IN QUEBEC.

at the crank. This time the first turn over compression set her going with a roar and I thought it must have been the battery after all.

"I won't weary you with repetition, but take my word for it we didn't get half a mile before going through the same performance and we repeated it every half mile for about the next five it seems to me, until I was desperate and finally resolved to fix things right if I had to dismantle the whole car. It was getting dark and at the rate we were going we were due home some time the next day so something had to be done. The spark was O. K. on either set of cells. She would invariably start with very little cranking so I didn't bother to look at the plugs, although my instructress had her eye on them. She had just got down out of the tonneau to stretch a bit and had assumed command. Have you looked on the inside of that thing—the what you call it—pointing an imperious finger to the junction of the four exhaust pipes. That thing, I echoed, putting my finger on the hot pipe unconsciously, but taking it away quickly enough you can be sure. No silly, that thing on the other side, the carb—whatever you call it. Oh, the carburetter. I almost groaned. I had had it all down only ten minutes before—the tank was half full and I had crawled on my back the full length of the car to see that there were no breaks or kinks in the pipe.

"The moment she saw me burn my hand on the exhaust pipe, she knew she was wrong and shifted her ground. While I had only had the carburetter down a few minutes before I didn't like to say so, because I hadn't located the trouble and the engine didn't perform much better, although I couldn't for the life of me see what was stopping the gas for I had sucked my mouth half full of gasolene in testing the spray nozzle. First I blew down into it a couple of times, but wasn't sure of it, so like the boy with the soapy water and clay pipe, I tried drawing in for a change and the result didn't sweeten my temper any I can tell you. When the dear young thing told me to take that thing apart and clean it, just as if she were ordering a maid to wash the dishes, I was about ready to boil over. But I didn't. Never mentioned a word about having been all through it not fifteen minutes before, but set about it as if I had never thought of such a thing. Had it well down when she grabs one of those fine little hair pins out of her hair and says, 'here, take this and run it through that atomizer thing.' I did just as I was told and may the drinks be on me for the next year to come if jobbing that hair pin through there didn't bring out a fly. Just a common, ordinary, everyday fly. Don't ask me how it got there. That's too much for me, you're entitled to as many guesses as I had and welcome to them. But it's easy to see how it caused all the trouble. Worked up and down the tube and got caught in the spray hole every now and again. Then the liquid dropped back and Mr. Fly with it and let some more come out.

"Didn't have a bit of trouble after that; came home on the high all the way at better than forty per. Made the girl's everlasting reputation for a wise one about a car, but save me from the woman who likes to direct operations while you do the work, for all that," concluded the motorist with the reminiscent look in his eye.

Stockholm, Sweden, now boasts the grand total of 151 motor cars, including those owned by members of the royal family, and the number is said to be increasing. The fact that nearly all the towns and villages of the country are equipped with electric lighting plants would seem to indicate that there is a good opening for electric vehicles.

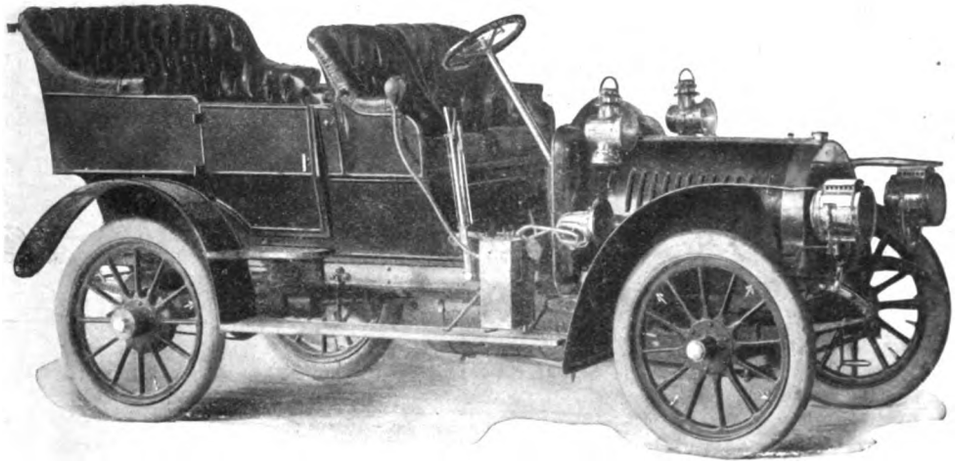
The New Model 1906

Rainier

30-35 H. P.

What is the automobile buyer going to do when he is strenuosly told that each and every one of the 1906 cars is THE BEST CAR IN THE WORLD?



He is going to do a little investigating.

He is not going to be attracted nor distracted by the whirlwind of words with which one car after another comes before the public on paper.

When he gets down to business, he will find the RAINIER in the front rank of cars that have won renown and made fast friends by actual achievement. He will find that in every inch of metal and wood, in every working part, in every line, the Rainier as it will take the road in 1906 is the very embodiment of strength, compactness, lightness and beauty —now more than ever before "The Pullman of Automobiles."

We want good Rainier agents in all unassigned territory. We can give them a car to sell that WILL sell, and that will make a new salesman of every purchaser. We stand back of the Rainier with the broadest and most liberal guarantee ever given.

Correspondence invited.

ENGINE.	30-35 H. P., 4 cylinders, water cooled.	**VALVES.**	Mechanically operated, inlet and exhaust interchangeable.
IGNITION.	Sims-Bosch Magneto—make and break spark.	**CARBURETTER.**	Float feed, requiring no adjustment.
TRANSMISSION.	Sliding train. 3 speeds forward and one reverse.	**BRAKES.**	Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
REAR AXLE.	Bevel gear drive, clutch driven hub. Ball bearings.		
FRONT AXLE.	I Beam section. Ball bearings.		
FRAME.	Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.	**BODY.**	Full aluminum, double side entrance.
		EQUIPMENT.	Two head lights, 2 side lights, 1 rear light, 1 horn.
WHEEL BASE.	104 inches.		
WHEELS.	Imperial whalebone, grade A 2nd growth hickory.		
TIRES.	Continental 34 x 4.		

Price, $4,000.

The 22-28 H. P. will be continued as heretofore, without any changes.

4 cylinder—98 inch wheel base—La Coste coil. French battery. Continental Tires. Aluminum side door body

Price, $3,500.

BOTH MODELS GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

The world's broadest and most liberal automobile guarantee. Landaulet bodies for immediate delivery. Limousines for November and December delivery.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Boston Agents: MORRISON-TYLER MOTOR CO.

Good Agents wanted in unassigned territory.

RENAULTS' SHOCK ABSORBER

Those Veteran Manufacturers Use Glycerine and Water in their Device—How it is Done.

Following the general trend noticeable in the employment of auxiliary spring devices on the part of car owners who have generally taken to supplementing the suspension originally supplied by the designer by the addition of various forms of shock absorbers to be had in the open market, the designers themselves have begun to do likewise. One of the first investigators in this field is the house of Renault Freres, of Paris, to which a patent has recently been granted on a device for this purpose.

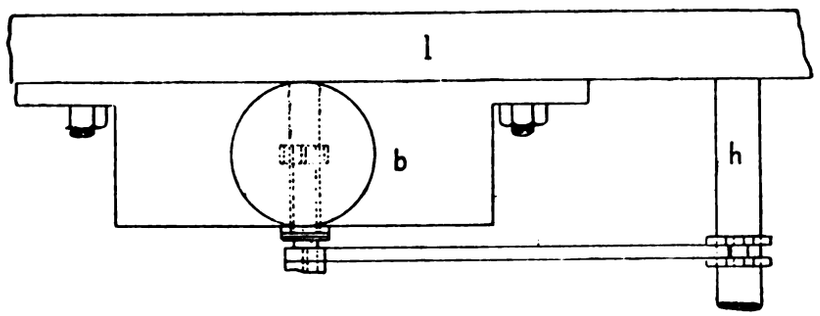

Fig. 1.

It is termed a shock absorber, and consists of a small sylinder affixed to the frame of the chassis at a convenient point. This is partially filled with a mixture of water and glycerine or heavy oil, and is fitted with a piston A, Fig. 1, the normal position of which is central, as shown. The movement of the latter is transmitted through a series of levers to the axle of the car, H, or it would be more accurate to state that the brunt of the shock received by the latter are transmitted to the glycerine cylinder and there absorbed in much the same manner as that commonly employed in taking up the recoil of modern high powered guns. The chambers, b' and b", before and behind the piston, are connected by a groove, or depression, in the wall of the underside of the cylinder, I, the depth of which is greatest at the centre and gradually decreases as it approaches each end. This permits of a small portion of the liquid passing from one end to the other reciprocally, and the canal, J, which may be closed more or less as desired by the adjusting screw K, is for the same purpose. These permit the device to oppose much or little resistance to the shocks received by the axle, and to absorb them slowly or otherwise, according to the needs of the car to which it is attached, and much after the fashion of the common door check, which works on very much the same principle and can be set to close the door slowly or quickly. An opening is provided at M through which to replenish the liquid.

The action of the device in operation may readily be understood from the sectional sketch shown in Fig. 1. Upon the road wheels violently striking an obstruction or dropping into a hollow, the excess force that is not absorbed by the tire is transmitted to the spring, which is usually connected directly to the axle. This causes the latter to rise, and it in turn transmits its movement to the lever F, keyed upon it, and so on until it reaches the piston, where it is absorbed by the latter compressing the liquid, against which it must act. The depression, or groove, I, being largest at the centre, it permits of a more or less rapid escape of the liquid at first, so that for the moment the movement of the piston is rapid, but once past the centre it closes this outlet and moves more slowly, as the only escape is then through the channel, J, and past the regulating screw at the end of it. Thus it provides sufficient mobility to take up slight shocks, and at the same time offers a great deal of resistance to more powerful blows, its braking effect preventing the springs from coming together. By means of the regulating screw it may be adjusted in accordance with the load imposed upon it. Its location upon the car is shown in Fig. 2.

Fig. 2.

WEISS'S NOVEL MUFFLER

Employes a Valve to Obtain Free Exhaust and Makes Some Strong Claims for It.

Among the various problems which have taken up their full share of the gas engine designer's time from the beginning of the automobile movement up to the present, that of suitably muffling the exhaust gases so that the noise of the wasting energy should be abated, and at the same time there should be no back pressure to detract from the effective power of the motor, has obtained its full measure. The idea of giving the gases an opportunity to expend during the muffling process was early gotten hold of, but the usual application of it in the use of a series of chambers through which the gas had to pass on its way to the outer air, and which were connected by means of a great number of tiny holes, caused a considerable loss of power.

A new device which is intended to do away with the greater part of the noise of the exhaust, and at the same time not to interfere with the freedom of the gases' exit from the cylinders, is the invention of L. T. Weiss, of No. 266 Graham street, Brooklyn, N. Y. In this muffler, which is constructed upon rather novel lines, the gases from the cylinders are discharged into a closed receptacle which has a volume nearly or quite five times the cubic contents of the cylinders. Directly after the exhaust valve has opened, but before the pressure within the muffler has had opportunity to rise to a point anything like that within the engine, a valve which communicates directly with the atmosphere is opened, and the discharge takes place through this until the main valve has closed and the pressure has been reduced to that of the atmosphere.

Thus, at the time of release, when the greatest amount of noise is generated owing to the impact of the high tension gases upon those which are at rest in the muffler or in the air, in case no muffler is used, the discharge being into a closed chamber, is absolutely silenced, while immediately thereafter, when the pressure has fallen to a point considerably below its maximum, the discharge to the atmosphere commences, but, being carried on through an ample expansion chamber, the products of combustion are deprived of the greater part of their energy, and hence the sound is not at all offensive.

The particular advantages claimed for a muffler of this type are, first of all, that the free exhaust which is obtained in this way insures a freedom from soot upon valves and cylinder walls which is not to be obtained in any other way, and, second, that by freely exhausting the products of combustion the incoming mixture will be freer than it otherwise would be, and that on this account the charge will be much less diluted and will be proportionately more powerful.

Dangers of Driving in India.

"Anyone able to get over a hundred miles of main Indian road without accident should be able to drive anywhere" is the opinion of an East Indian devotee of the car, expressed in the course of an article on the delights of automobiling in that far off country in the Motor Car Journal. "In a distance of thirty miles," he continues, "generally between 400 and 500 carts are passed, all drawn by bullocks, assuredly the most stupid animals in existence. Perhaps, though, I should give their drivers the palm in this respect, as it is absolutely impossible to guess what they will do.

"As a rule, these men are lying sound asleep on the top of the load, with a huge fold of cotton over their heads; it can therefore, be guessed what chance there is of even the most powerful horn reaching their ears. Probably after slowing down and tooting continuously the sound finds its way to the brain, and in another minute or two they begin to realize that there is something desirous of passing them. The result, if annoying, is certainly ludicrous, and can be compared to nothing so much as the sudden disturbance of an anthill. Dozens of naked legs are seen leaping to the ground, the cattle's heads are seized and the poor beasts are pulled this side or that, as the whim seizes their masters. The result is, of course, a general block, only dispersed by the use of some strong language on the part of the motorist. At times, but not too often the string of carts is on one side of the road so that the car can be driven by without disturbing the sleeping Jehus. The outcome, however, is generally disastrous, as the cattle in their terror rush off the road, perhaps down a 10-foot bank, and over go carts and contents. The drivers are always shot clear and I never heard of one being hurt, nor does the upsetting of the cart appear to worry the bullocks, as the peculiar mode of tethering enables them as a rule to keep their feet.

"To overtake a solitary cart is particularly dangerous, as you can never be sure that the man in charge will not pull right across in front of the car, as has indeed, happened to me more than once. Another curious coincidence is especially remarkable here in India; every woman and every chicken, no matter if well on one side of the road, feels impelled on the appearance of the car to cross over, quite heedless of the danger. Except on the main high roads it is very difficult to run along at any speed in this country. For the sake of economy streams and water courses are left unbridged, and many a broken spring is due to suddenly coming on a harmless looking depression without slowing up. The only close shave I have ever experienced was due to this cause, as the spring in breaking prevented the steering gear from turning and the car was off the road before I could pull up; fortunately no harm resulted."

The Canine of Center Square.

As a rule the roadside dog that takes it into his head that it is his bounden duty to scare away all passers by, seldom does anything more harmful than a little raucous vocalizing, but according to a story that comes from up the state, Center Square, a village near Gloversville, New York, has a dog that takes himself seriously in this role.

That seething center of activity is somewhat off the beaten track and automobiles are far from being a common sight there, so that when a family party bowled through in a car, the dog immediately ran out and gave battle to the strange looking monster. He seized one of the front tires in his teeth and was soon surprised to find himself forcibly revolving with the wheel. No one could exactly figure out the following sequence of events, but the result of the driver's concentration of attention on the dog caused a collision with another vehicle and the car took a ditch, sprung the front axle and dumped the passengers unceremoniously. What happened to the dog does not appear.

"Swift, Model 1901, 1902, 1903, 1904 and 1905"—it is all the same car, that has taken four years to build. Its creator, a bicycle repairer and general machinist in a little Down East town, started in four years ago to build an automobile. The result is the "Swift runabout, one speed forward, fifteen miles an hour downhill."

PENNSYLVANIA PRC CLINCHER

There are no perfect Motor-Cars, nor any perfect tires—as yet.

But if you have a car which you consider almost perfect perhaps you would like a tire fit to associate with it.

many. Filed July 24, 1903. Serial No. 166,909.

Claim—1. A starting mechanism for motors, comprising a shaft having projections, a pair of relatively rotatable elements loosely mounted on the shaft, one of said elements having helical clutch pieces and the other having slots to permit of said clutch pieces engaging the projections on the shaft, said slotted member adapted to cause said clutch pieces to disengage from the shaft when the shaft rotates in an opposite direction.

802,291. Magneto-Electric Ignition Apparatus for Explosion Engines. Gottlob Honold, Stuttgart, Germany, assignor to Robert Bosch, Stuttgart, Germany. Filed April 30, 1902. Serial No. 105,380.

Claim—In an ignition device for explosion engines, the combination, with a generator having a revoluble armature provided with two windings in inductive relation to each other, of a pair of spark electrodes, a circuit in which said electrodes and one of the armature windings are included, a short circuit in which the other armature winding is included, a condenser connected to said short circuit, and means operating synchronously with the revoluble armature of the generator and serving to open and close the short circuit.

802,321. Valve gear for Internal Combustion Engines. Francis M. Rites, Ithaca, N. Y. Filed January 8, 1904. Serial No. 188,170.

Claim—1. In an internal combustion engine, the combination with an engine cylinder, and a valve therefor provided with means normally holding the valve closed, of two valve actuating devices driven at different speeds, means for operating said valve comprising a shaft mounted in a fixed bearing and provided with an eccentric fulcrum, a valve operating member movably mounted upon said eccentric fulcrum, and means, comprising links, connecting said shaft and valve operating member to said valve actuating devices.

802,356. Steering Gear. Fred A. Law, Hartford, Conn., assignor to Electric Vehicle Co., Jersey City, N. J., and Hartford, Conn., a corporation of New Jersey. Original application filed April 3, 1902. Serial No. 101,290. Divided and this application filed July 19, 1904. Serial No. 217,156.

Claim—1. In combination in a steering mechanism, a body or frame base plate, a bearing therein for a rotating steering shaft, a rotating steering shaft, a screw on the lower end thereof, a second bearing in said base plate, a transverse shaft therein, a depending oscillating arm supported on said shaft, interconnections between the lower threaded end of the steering shaft and the oscillating arm including link connections located and moving substantially in the same vertical plane of the steering shaft, as and for the purpose described.

802,362. Anti-Friction Gearing. John M. Green, David E. Lyons and Andrew T. Garey, Los Angeles, Cal. Filed March 22, 1905. Serial No. 251,499.

Claim—1. In an anti-friction bearing, the combination of a sleeve provided with a plurality of peripheral annular flanges near the ends thereof, there being two of such flanges near each end, the outer flanges being higher than the intermediate flanges; bearing rollers intermediate said outer flanges, said bearing rollers having grooves near the ends thereof which straddle the lower flanges or intermediate flanges of the sleeve without being supported by said flanges, and spacing rollers intermediate of said bearing rollers, said spacing rollers extending over the flanges without touching the intermediate flanges and having grooves fitting over the outer flanges and being supported by said flanges.

802,386. Automobile-Horn and Means for Operating the same. Claud H. Foster, Cleveland, Ohio. Filed December 16, 1904. Serial No. 237,059.

Claim.—1. The combination, with the exhaust of an engine, of a horn provided with means for operating the same with fluid under low pressure and means for maintaining a constant pitch irrespective of a variation of several pounds to the square inch in the pressure of the operating fluid, substantially as specified.

802,389. The Ernest Gregg and Thomas H. Hirst, Birmingham, England, Assignors to William Knox D'Arcy, Stanmore Hall, Stanmore, England. Filed December 22, 1904. Serial No. 237,941.

Claim.—1. A vehicle-tire comprising a strong steel band, an outer arch-shaped cover surrounding the same, the cover being strengthened so as to be capable of resisting strong radial tension, and having wired edges, and eyebolts on the wires, substantially as and for the purposes hereinbefore set forth.

802,416. Manufacture of Vehicles, &c. Jacobus Spyker, Trompenburg, near Amsterdam, Netherlands. Filed October 21, 1904. Serial No. 229,507.

Claim.—1. The method of manufacturing vehicle bodies and the like consisting of first constructing a core of any desired contour, perforating the same, and providing the core by electrolytic means, with metallic connecting portions within the perforations and a metallic cover formed with said portions.

802,442. Motor-Vehicle. John A. Carr, Denver, Colo., Assignor of one-half to Chas. J. Koehler, Denver, Colo. Filed November 22, 1904. Serial No. 233,877.

Claim.—1. In a device of the class described, the combination with front and rear axles and a framing carried thereby, of a shaft journaled in said framing, a bearing-block inclosing said shaft, a pivot block pivotally engaging said bearing block, rigid connections between said pivot block and the front axle, means carried by the pivot block for effecting movement of said shaft corresponding to pivotal movement of the front axle, a joint interposed in the length of said shaft for accommodating such movement, and intermeshing gearing carried by said axle and shaft.

802,474. Nut-Locking Device for Vehicles. Abe L. Renwick, Elmwood, Ill. Filed Aug. 15, 1904. Serial No. 220,766.

Claim.—1. In combination with an axle-nut of a vehicle, a spring arm pivoted in the nut, there being a recess in the nut for receiving and holding the said arm when locked in place to secure the nut, and a member at the opposite end of the pivoted arm for engaging the axle, there being a notch in the said axle for receiving said member substantially as described.

802,489. Speed Changing Device. Hans Baerbalck, Hamilton, Ohio, Assignor to Hamilton Machine Tool Company, Hamilton, Ohio, a Corporation of Ohio. Filed November 30, 1904. Serial No. 234,845.

Claim.—1. The combination of a rotative shaft, two series of loose gears thereon, and a hand actuated mechanism arranged to independently lock any gear of either series to the shaft.

802,540. Speed Regulator for Explosion Engines. George A. West, Buffalo, N. Y., Assignor of one-half to Austin M. West, Buffalo, N. Y. Filed November 24, 1903. Serial No. 182,550.

Claim.—1. In an internal combustion engine, an exhaust valve, an exhaust valve stem, a cam for actuating the valve stem, a spring pressed catch normally riding against one side of the crank shaft end of the stem and movable each time the valve is opened to a position in alinement with the stem to prevent closing movement of the valve, a governor arranged within and movable with the actuating cam, the governor including a two-armed lever, one arm of which is weighted, an auxiliary cam adjacent to the active face of the exhaust cam and serving to engage the catch and move the same to release position, and a stud connecting the auxiliary cam to the unweighted arm of the governor, the wall of the actuating cam being provided with a curved slot for the passage of said stud, substantially as specified.

802,560. Rotary Engine. James H. Gamble, Colorado Springs, Colo. Filed June 9, 1904. Renewed August 29, 1905. Serial No. 276,329.

Claim.—1. In a rotary engine, a cylinder having an abutment, a revoluble piston having end flanges, and a reduced intermediate portion, the periphery of such intermediate portion being provided with pockets, and the opposing side walls of the flanges being recessed, pivotally mounted piston wings extending within the pockets and recesses, the walls of the recesses forming supports for the opposite ends of the wings when the latter are exposed to the action of steam, and auxiliary ports extending through the periphery of the piston and opening into said pockets, thereby to permit outward movement of the wings under steam pressure.

802,574. Top for Vehicles. William Lindsay, Pittsburg, Kansas, Assignor of one-half to J. B. Mantonya, Pittsburg, Kansas. Filed March 21, 1905. Serial No. 251,305.

Claim.—1. A collapsible top comprising side frames, top bows permanently connected to the same and hinged thereto, front and rear bows hinged to the frames, top bows hinged to and connecting the front and rear bows respectively, and links connecting the frames with the front and rear bows, one of said frames and its front and rear bows being adapted to fold between the top bows and the other frame and its front and rear bows.

802,581. Lubricator. David Morehouse, Delphos, Ohio. Filed January 30, 1905. Serial No. 243,295.

Claim.—1. In a lubricator, the combination of a cylinder having a tube extending therethrough from one head to the other, and secured at both ends to said heads, and a follower slidable on the tube and dividing the cylinder into oil and steam chambers, the tube having an inlet from the oil chamber at one end and an outlet to the exterior at the other.

802,600. Tire. David R. Salisbury and Oliver D. Salisbury, Owosso, Mich. Filed January 4, 1905. Serial No. 239,546.

Claim.—1. A tire comprising an inner tube, a flexible outer casing inclosing said inner tube upon the sides and adjacent the tread and having outwardly-turned edges, a base band connecting and having its edges secured to said outturned edges and means for securing said edges rigidly to the rim of a wheel.

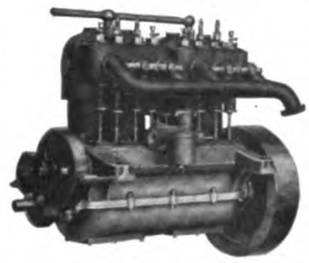
THE STEEL BALL CO., Chicago, Ill.

Gentlemen:—We desire to express our sense of the great assistance your Oiler was to us in our recent 6 days endurance and economy run at Long Branch In a run of 3202 miles made in a little over 6 days, we only used 10 gallons of oil and your oiler delivered the oil in an unfailing measure as set. Its operation was perfect at all times. The importance of this we fully realize and its help in getting this record for our FRAYER-MILLER car.



Yours truly,

Investigate " Whitney" Standards for dimensions of Roller Chains. They have been adopted by most of the Leading American Automobile Builders and have been recognized by other chain makers at Home and Abroad. If they are made universal six sizes of chain can take the place of over thirty sizes used in the past.

1906 MODEL "WHITNEY" DETACHABLE CHAINS—Patented.

Now 1906 Model " Whitney" Chains are absolutely noisless on certain cars where sprocket conditions are most favorable and they are breaking all previous records for efficiency.

We urge manufacturers in the future to machine sprockets correctly and to allow sufficient space for chain clearance. We believe, at least, 40 per cent. of the chains used in the past have been damaged by interference and an incorrect sprocket can ruin the best chain made.

THE WHITNEY MFG. CO., Hartford, Conn.

There are reasons why

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

Reason 5
DURABILITY.

¶ Lastly, a good tire is necessarily a durable tire—capable of withstanding all sorts of rough usage without making any ado about it.

¶ Durableness is dependent—absolutely dependent—upon the construction of the tire as a whole—there can be no weak spots.

☞ **Toughness, superior fabric, adequate amalgamation and a proper degree of pliableness are the essential features in a durable tire, and we claim and know and have proven that these are the paramount elements in Morgan & Wright tires.**

¶ And because they are the paramount elements, MORGAN & WRIGHT TIRES ARE GOOD TIRES.

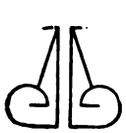
Congratulations

from a dealer in a rough-road country on the service obtained from

GOODRICH TIRES



WITH THE BAILEY TREAD.

"We wish to congratulate you because of the splendid way your Goodrich-Bailey tires have given satisfaction and service to us and our customers. They not only wear longest with the least show of use, but seem to be free from weak spots, such as fabric breaks and rubber and fabric parting company on the Tread, the latter seems to be a sure thing on some tires that we know of.

We are looking to 1906 Goodrich and expect to be partial to them, because we believe they deserve it if their previous reputation is any criterion to go by."

—*Asheville Cycle and Auto Co.*, Sept. 23, 1905.

THE BAILEY "WON'T SLIP TIRE." Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyright mark have been inspected and pronounced perfect. We guarantee our tires only on rims so branded.

THE

HAYNES

WON HONORS

A regular "Haynes" stock touring car, outclassed the especially constructed racing monsters, in the Vanderbilt Cup Elimination Trials securing a position that entitled it to a place on the American Team.

A random comparison of the cylinder capacity of the competing cars with the HAYNES (5 inch bore x 6 inch stroke) is sufficient to demonstrate what a wonderful achievement this was.

EXACT DUPLICATES—of the car that outclassed and outdistanced powerful racing monsters is offered for 1906.

LIVE AGENTS—are quick to realize the advantage of handling a car like this. Get your application in early.

We are booking orders in their turn for this car.

The Incomparable

WHITE

The Car for Service.

ANNOUNCING BULLETIN NO. 11

The most notable victory of the year scored by a stock car was the record trip of George A. Hensley in a White steamer from San Francisco to Los Angeles—a distance of 470 miles—in 21 hours and 12 minutes. This record superceded that of a 30 H. P. machine which had previously negotiated the distance in 24 hours and 56 minutes.

Three months have elapsed since Mr. Hensley's record drive and his record is still unapproached.

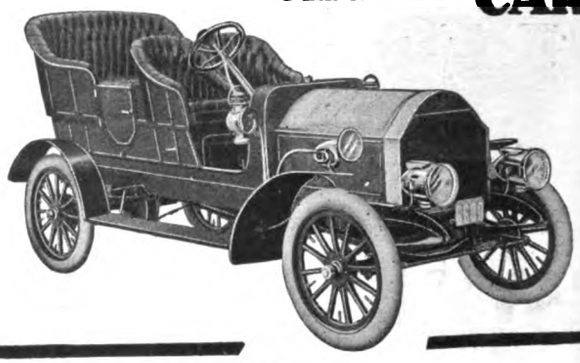
TALKIN' OF THE COST OF UP-KEEP

The Royal Tourist cars are run by their owners at less repair expense than any other motor cars built. You simply do not have repairs. Ask an owner of a Royal how much it costs him to maintain it. Then compare his figures with any other car, big or little touring car or runabout. Royal owners everywhere. Ask one.

Why is this? Every part is made and put together with proper care. Money is freely spent for best materials. That's why!

That is also the reason why we were able to roll our car over in the Vanderbilt Trials and then finish among the first.



ROYAL

Peabody, Mass., U. S. A.

The Expected Revolution Has Come!

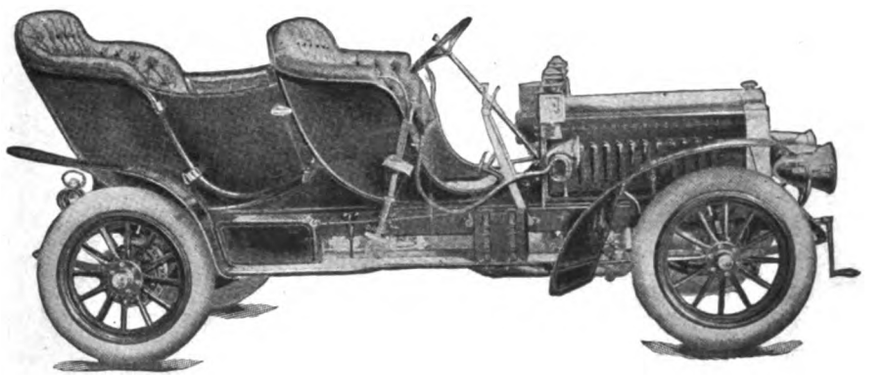
If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found he only good reason why you should ***not*** buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the ***two*** cycle two cylinder Elmore engine.

Understand—the ***two*** cycle two cylinder Elmore engine produces ***two impulses every time the fly-wheel turns.***

As you know, the two cylinder ***four*** cycle furnishes only ***one*** impulse every ***fourth*** time the fly-wheel turns.



In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time in finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached its climax this season after five years of steady improvement.

THE NEW THOMAS

Greatly Exceeds My Most Sanguine Expectations.

EXPERTS SAY IT IS A WONDER.

No customer is so critical or hard to please as the manufacturer, who, regardless of cost, absolutely determines to do his utmost to build the best Car in the world.

But, when an ordinary Stock Touring Car, without special preparation or intention, runs sixty miles an hour on the level and climbs a 10 per cent. grade on the high speed at forty miles per hour, within an hour after it first leaves the shop, it is something that not one Car in a thousand will do.

Under favorable conditions, we should do sixty-five miles an hour.

I am more pleased than ever with its speed, hill climbing, quiet operations and mechanical superiority, and cordially urge disinterested Automobile experts everywhere to rigidly investigate our claims and compare our material, workmanship and design with the highest priced Cars in the world—and we will win the verdict.

OLDSMOBILE

¶ Without going into minute details of construction of Model S (which we will gladly send you upon application), we will mention some of its features which stand out prominently, giving this machine its **marked individuality**

The Motor is of the four-cylinder, vertical, water-cooled type, developing 24 to 26 H. P. The cylinders are cast in pairs and are water-jacketed in such a manner that only the cylinders themselves are cooled, but the valves as well. All material used in the construction of the motor, as well as in every part of the machine, is carefully analyzed and tested, and each cylinder is thoroughly inspected. In common with the most up-to-date cars the motor may nearly always be started from the seat, thus doing away with the necessity of cranking. This is a very attractive feature.

The Crank Shaft is of special carbon steel and runs in long bearings. An oil pump in constant operation forces oil to all main bearings.

Cross Section of Clutch

The Transmission is of the sliding gear type, having three speeds forward and one reverse.

The Clutch is of the "dish pan", or cone type, fitted with leather surface, and a simple spring device which allows the load to increase gradually, thus doing away with any jerking in starting.

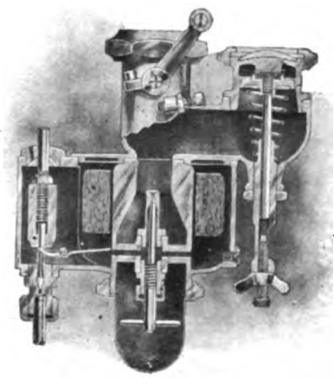
The Control is by single lever within easy reach of right hand. The whole transmission is enclosed in an oil-tight case and runs in oil bath.

The Springs are of flexible, half elliptic type, giving exceedingly easy riding qualities. Length, 36 inches front, 48 inches rear.

The Ignition consists of four unit coils operated by dry cells, storage battery or magneto. The commutator is very accurate in its action and is instantly accessible—**accessibility of parts being a feature of this car.** The spark plugs are easily examined and connections quickly and positively made.

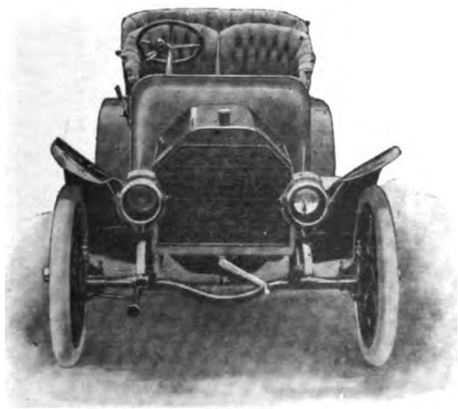
The Axles are fitted with Timken Roller Bearings throughout, and are made sufficiently heavy to withstand hard usage. **The rear axle is fitted with bevel gear drive, eliminating chain trouble.**

The Wheels are 32 inch, equipped with 3½-inch pneumatic tires. Four-inch tires for unusual or extraordinary service can be had on special order.



Cross Section of Rear Hub Brake

The Brakes. Each rear wheel is fitted with an effective toggle joint brake, which is absolutely positive in action, the large friction surface insuring a brake that brakes. Transmission brake is operated by foot lever.



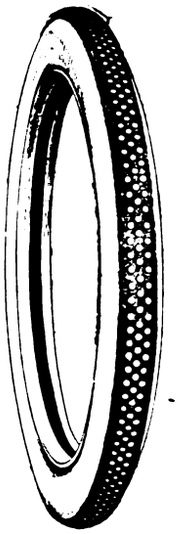
The Steering Gear is of the "worm and nut" type, controlled by 16-inch wheel placed in very comfortable position. Spark and throttle control levers are located just below the wheel on right-hand side of the post. In addition to the regular throttle an accelerator pedal is provided, whereby speed may be momentarily increased.

The Carburetor is of the most efficient and best type. Particular attention has been given to this most important part of an automobile power equipment. Our new and improved carburetor, has several distinctive features; for instance, the gasoline nozzle instead of being placed in a mixing chamber by itself, runs up through the center of the float chamber. An auxiliary air inlet is also provided, which insures the maintenance of a perfect mixture. The result is a large decrease in fuel consumption and increased power.

The Water Circulation is by gear pump driven from crank shaft. Water is forced around water-jacket and out into the radiator mounted in front of car. Sufficient cooling surface has been provided, so that the temperature of the water is always kept well below the boiling point.

Cross Section of Carburetor

Oldsmobile Model S



¶ Next week we will take up these and other distinguishing features of the Oldsmobile more in detail and show what they mean to you as a dealer or a buyer. Model "S" has a well-balanced, rangy exterior, distinctive and irresistably attractive. It has the equally well-balanced internal construction. It's the car that commands your attention on sight and holds your interest on demonstration. Orders are now being entered for these cars.

MICHELIN

The new MICHELIN ANTI-SKID TIRE adopted by all as the most perfected non-slipping, non-skidding and resilient.

WHAT A PLEASED CUSTOMER SAYS:

Mr. E. D. WINANS, 646 Jefferson Ave., Detroit, Mich.
Michelin Tire Co., New York.

Dear Sir:—The new Michelin Anti-Skid Tires are giving utmost satisfaction. They possess the resiliency and speed of pneumatics with non-slipping advantage.

Very truly,
GEO. L. FLEITZ.

Mr. C. E. Miller,
#96 Reade Str.,
New York.

Dear Sir:-

I wish to write you regarding the Brampton chains which I purchased for my Franklin car.

No. 1 I have used all the time and have given it about as hard a pull as it is possible for a chain to receive. All over the mountains of Orange County, New York, and between New York, Philadelphia and Lakewood until I am tired of the road.

The long chain on the Franklin is a pretty stiff proposition and many, in fact, most of my friends state that their first trouble on that car is that chain breaks and I have met people who have worked for hours to get their chain fixed on the road, but I have never met a Brampton in trouble and mine so far has not a scratch on it.

No. 2 is in the paper in which your salesman wrapped it for me, and is resting in the bottom of the car waiting for No. 1 to break.

My partner, Mr. Wilmarth, President of the L. I. Automobile Club, has a Brampton on his Winton and has had practically the same result as myself. He got me in line for the Brampton and there I stay.

Very truly yours,

Dict.

A DOCTOR'S OPINION

MILWAUKEE, WIS.

"I am so well pleased with the tubular steel wheels made by you for my old Winton that I feel under obligation to express to you my satisfaction with them, and I desire further to compliment your machining of the hubs to fit the new steering knuckles furnished by The Winton Manufacturing Company.

"My machine is now thoroughly over-hauled and repainted, and I was so surprised to see how much the general appearance of the car was improved by your artillery wheels that I thought I would throw you a bouquet and let you join with me in a feeling of complete satisfaction."

Very truly yours,

This AUTO TIRE is Both DURABLE and LIVELY

When you buy an *ordinary* Auto Tire, you have to decide a difficult question.

Is it best to get a hard, inflexible tire, which will rack your bones and soon put your car out of business, but which will *last a season or more*.

Or—

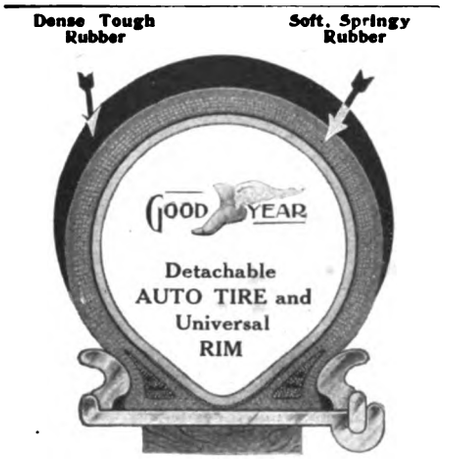
To get a soft, resilient, easy riding tire, which will go to pieces in a short time because it won't stand the wear and tear of the road?

Momentous question.

And either way you answer it— you lose.

Because if you decide on the *hard* tire, it means breakdowns on the road, and consequently liberal use of a farmer's team. It means constant repairs to your engine, a car always in the shop. Your own aching joints are thrown in for good measure.

And if you select the *soft* tire, it means punctures, tire explosions and tire troubles generally. And you have to buy new tires every little while.



It's Money,—Money—Money, either way.

You'll envy Rockefeller before you get through.

Now you can *dodge* this momentous question if you will.

Because the Goodyear Detachable Auto Tire has all the GOOD points of both the *hard* and the *soft* tire with the bad features of neither.

It's easy for anyone to understand WHY this is true. Read carefully, and see for yourself.

First, look at the section of the Goodyear Tire in the center column. Notice the crescent shaped portion in solid black where the wear of the road comes. That's dense, firm rubber, as tough as rawhide—practically no wear out to it. It's what the *hard* tire is made from.

Now right underneath this is the remainder of the outer tube (shown in grey) which is made from pure para rubber, as resilient and springy as it is possible for rubber to be. It's the same as the seldom-used *soft* tire.

These two different kinds of rubber—the dense, tough composition, to take the wear, and the soft, elastic rubber, to make you ride easy—are made into one solid piece by a special process. You can't skin the two kinds of rubber apart with a knife. Try it, if you doubt.

The soft rubber portion is strengthened by having our *special fabric* vulcanized into it. This fabric is not the hard, inflexible sail cloth used in ordinary tires, but is woven like basket work, or an open work stocking, and *gives* back and forth under pressure, and allows the elasticity of the rubber full play.

The dense rubber, the soft rubber and the special fabric together make a tire that's almost as durable as a *solid* tire, a tire difficult to puncture yet one which is as *resilient* as a man could reasonably ask.

Our "Good News Book" tells more about the good points of this trouble-saving tire. You ought to get it now, for the Goodyear Detachable Auto Tire with Universal Rim will be "the only tire" next season.

THE GOODYEAR TIRE & RUBBER COMPANY, **Grove Street, Akron, Ohio.**

THE WHITLOOK COIL PIPE COMPANY,
HARTFORD, CONN.

WHY PREMIER CARS

Appeal to All Classes.

TO THE PROFESSIONAL MAN—Because of its simplicity.

TO THE BUSINESS MAN—Because of its readiness to go at all times.

TO THE REPAIR MAN—Because of its perfect accessibility to working parts.

TO ALL MEN—Because of its low cost of fuel and maintenance.

We have much data from drivers on this latter point; for instance, one writes us: "The total cost of my running this season—5000 recorded miles—is only a trifle over one cent per mile for the car—or 1-5th to 1-4 cent per mile per passenger—total for repairs, fuel, etc., excepting tires."

These are points to remember when purchasing a car.

"The air cooled season never ends."

Side Entrance Model - $1500 Runabout - $1250

Rambler

The Car of Steady Service.

The pleasures of an automobile are in direct ratio to the serviceability of the car.

This spells RAMBLER to experienced users.

It is a car of steady day after day service that you do not have to "nurse" over every bit of bad road to prevent break-downs.

It has abundant power and is built to stand the strains of that power and the hard usage resulting from the operator's confidence in its ability to go, and keep on going, to the end of the road—and then come home again.

If this, in connection with elegant appearance and a price, low in proportion to its high qualities, appeals to you, call and ask for a thorough and convincing demonstration. Representatives in all leading cities.

Surrey, Type One, a five passenger, medium weight, touring car, ready for the road with lamps, horn and full equipment of tools, etc., $1200.

Cape top, or canopy top with glass front, $100 extra.

Surrey, Type Two, a five passenger touring car of more elaborate design with double chain drive, full canopy top and glass front, $1650.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, November 9, 1905. No. 7

CONSOLIDATED CRIES QUITS

Finds Bicycles More Profitable than Autos and Acts Accordingly—Yale Car Abandoned.

The Consolidated Mfg. Co., Toledo, Ohio, makers of the Yale car, have quit—that is, quit the business of automobile manufacture. They will, however, continue the production of bicycles, which was their original business.

To the general public this will prove in the nature of sensational news, although those "in the know" long have been aware that the Yale car had not proven a profit payer. Strenuous efforts were made by the heads of the company to turn the tide, but to no purpose.

Not even the radical reorganization effected several months since proved of avail; in fact, it proved the beginning of the end. Several big railroad men who bought into the company at the time took the bull by the horns and had an expert go deep into the concern's affairs. He reported that while the bicycle department had proved profitable, the automobile end of the business had lost money from the beginning. To mend matters, the expert said at least $500,000 would be necessary.

The report was sufficient for the interested people. They immediately ordered the ringing down of the curtain. The automobile department was promptly shut down and has ceased to exist. If the stock and machinery on hand can be disposed of, it will be sold to the best advantage, but whether or no, the Consolidated Mfg. Co. is through with automobiles. A Buffalo manufacturer made a bid for the property, but the deal fell through when it seemed on the point of consummation. Another manufacturer also made an offer for the concern's Selden license, but nothing came of it.

Cadillac Buys Metzger's Business.

W. E. Metzger, who in addition to being general sales manager of the Cadillac Motor Car Co., has maintained one of the most prosperous retail establishments in Detroit, Mich., has disposed of the latter to the Cadillac Co., who will continue it as a branch store. In addition to the Cadillac line, the Pope-Waverly electric will be handled.

Apperson Saves His Plant from Fire.

Fire in a wooden structure adjoining the brick plant of the Apperson Bros. Automobile Co., Kokomo, Ind., on Monday night last caused about $5,000 worth of damage, which is fully covered by insurance. The building destroyed was not an essential part of the Apperson plant and will cause no delay and small inconvenience. It was due to the quick action of Elmer Apperson, the head of the company, that the fire did not prove serious. When the flames were at their height he jumped for the steel door connecting the frame building and the brick factory, and, although he was painfully burned about the hands and arms, he succeeded in closing the door and thereby saved the plant.

Greater Cadillac Chooses Officers

At the meeting following the formal merger of the Cadillac Automobile Co. and the Leland & Faulconer Mfg. Co. into the Cadillac Motor Car Co., these officers were elected: President, Lem W. Bowen; vice-president, Clarence A. Black; secretary, Wilfred C. Leland; treasurer, William H. Murphy; general manager, Henry M. Leland.

Parish Locates in Reading.

The N. E. Parish Mfg. Co., which is shortly to begin the manufacture of nickel chrome steel frames, has secured a factory in Reading, Pa., close by the immense Carpenter Steel Works, with which it will be more rather than less intimately related. The necessary machinery is now being installed.

Olds Workers to Meet in Lansing.

The Olds branch managers, travelling salesmen and larger agents are due to gather and confer at the factory in Lansing, Mich., on the 17th and 18th inst. The new Oldsmobiles will be then uncovered for the first time and several matters of policy be discussed.

"E. V." Bonds are Extended.

The bonds of the Electric Vehicle Co., which matured November 1, have been extended. They are held chiefly by those intimately connected with the company.

Welch Adds $50,000 Capital.

An increase of $150,000 has been made in the capital stock of the Welch Motor Car Co., of Pontiac, Mich. Its capital was formerly $100,000.

OLDS TAKES UP TWO-CYCLES

Pioneer Makers Make a Surprising Departure—Four Cylinder Car also Listed.

What is easily the most surprising announcement of the season is the one officially made this week by the Olds Motor Works—that for 1906 they will manufacture and market an Oldsmobile with a two-cycle engine.

While their announcement of a four cylinder four-cycle touring car was not unexpected, the Olds people were uncommonly successful in keeping the two-cycle model under cover. It was only last week that the first reports of it leaked out and got abroad. But further than that this new car will be of two cylinders, and that it will list at $1,200, nothing more is now known of it. It replaces the two cylinder four-cycle horizontal Oldsmobile of this season, and that it will attract a lot of new interest to the two-cycle type goes without saying.

The four cylinder Oldsmobile will list at $2,250. Its engine will be positioned vertically, of course, and will be of 24-26 horsepower. The cylinders will be cast in pairs, and will be water jacketed even to the valves. Water circulation will be by gear pump. Cone clutch, shaft drive and sliding gear transmission, affording three forwards and one reverse, and operated by a single lever, will be employed. Four unit coils, operated by dry cells, storage battery or magneto, will comprise the ignition system. The 32-inch wheels, with Timken roller bearing axles, will be fitted with 3½-inch tires.

In addition to these two brand new models, the curved dash Oldsmobile runabout, at $650, will constitute the Olds line for 1906.

Nine More Obtain Membership.

By mail vote the following have been elected to membership in the Motor & Accessory Manufacturers: Gabriel Horn Mfg. Co., Cleveland, Ohio.; Gilbert Mfg. Co., New Haven, Conn.; Holley Bros., Detroit, Mich.; Belden Automobile Transmission Gear Co., Pittsburg, Pa.; Weed Chain Tire Grip Co., New York City; Lunkenheimer Co., Cincinnati, Ohio; Valentine & Co., New York City; McCord & Co., Chicago, Ill., and the Republic Rubber Co., Youngstown, Ohio.

The Week's Incorporations.

Chicago, Ill.—Austin Auto Club, under Illinois laws; capital not given. Corporators—John J. Miller and Fred C. Rounds.

Frankfort, Ind.—Automobile Vending Co., under Indiana laws, with $10,000 capital. Corporators—Thomas E., Owen E. and Mary E. Brumbaugh.

New York City, N. Y.—Automobile Realty Co., under New York laws, with $25,000 capital. Corporators—Jacob Reitman, A. Kreitzel and L. Lewin.

Augusta, Me.—Hamilton Automobile Co., under Maine laws, with $50,000 capital. Corporators and officers—A. P. Bibber, president; W. S. Lee, treasurer.

Oswego, N. Y.—New Amsterdam Motor Co., under New York laws, with $75,000 capital. Corporators—Charles Morgan, E. F. Terry and Alfred Brotherhood.

St. Louis, Mo.—Seaton Auto Tire Co., under Missouri laws, with $150,000 capital; fully paid up. Corporators—Henry Schiel, W. F. Seaton and A. S. Doxee.

St. Louis, Mo.—Phoenix Automobile & Supply Co., under Missouri laws, with $4,000 capital. Corporators—W. Mulford, Edward Holmes and Freeman Wright.

Brooklyn, N. Y.—Prospect Construction Co., under New York laws, with $6,000 capital; to conduct garage. Corporators—W. C. Damron, H. B. Hill and J. W. F. Ehlers.

La Crosse, Wis.—The Auto Rapid Transit Co., under Wisconsin laws, with $25,000 capital. Corporators—A. J. Stephenson, W. J. Brayton and Philip McMahon.

Utica, N. Y.—Consolidated Motor Car Co., under New York laws, with $25,000 capital; to deal in automobiles. Corporators—F. P. Miller, H. H. Mundy and G. H. Harris.

Moline, Ill.—Deere-Clark Motor Car Co., under Illinois laws, with $100,000 capital; to make motor vehicles. Corporators—C. F. Drury, R. S. Blakemore and W. E. Clark.

Williamsport, Pa.—Williamsport Automobile Exchange, under Pennsylvania laws, with $10,000 capital; to deal in automobiles. Corporators—H. A. Bubb and B. Bubb, Jr.

Chicago, Ill.—Keeley-Hunter Co., under Illinois laws, with $15,000 capital; to manufacture automobiles. Corporators—Gordon L. Gray, George P. Rowell and Henry A. Ritter.

New York City, N. Y.—Adams Vehicle Co., under New York laws, with $5,000 capital; to make and sell all kinds of vehicles. Corporators—L. C. Weir, B. W. Rowe and H. H. Gates.

Chicago, Ill.—Biddle-Murray Mfg. Co., under Illinois laws, with $10,000 capital; to manufacture automobiles. Corporators—Ralph McShaw, John D. Black and Edward C. Maher.

Atlantic City, N. J.—The Atlantic Automobile Co. and Machine Works, under New Jersey laws, with $50,000 capital. Corporators—Louis H. Hopper, Frank A. Broadhead and Clarence L. Cole.

Newark, N. J.—Motor Vehicle Co., under New Jersey laws, with $5,000 capital, all paid in; to deal in automobiles. Corporators—Alfred A. Walsh, William F. Kimber and William P. Howe.

Havana, Ill.—McFadden Mfg. Co., to manufacture gas engines of every description; capital, $24,000. Corporators—G. C. and B. L. McFadden, John W. Watts, J. H. Harvey and George Fish.

Malden, Mass.—United Automatic Supply Co., under Massachusetts laws, with $40,000 capital; to deal in automobiles. Corporators and officers—H. C. Prescott, president; F. M. Prescott, treasurer.

Jersey City, N. J.—Bergen and West Side Automobile Club, under New Jersey laws, with $9,000 capital; to conduct garage. Corporators—Walter G. Russell, Albert Levly and Winifred Green.

Akron, Ohio.—The Andrews Automobile Clutch Co., under Ohio laws, with $10,000 capital. Corporators: Will Christy, C. B. Raymond, E. E. Andrews, L. C. Miles and C. C. Goodrich; $10,000.

Battle Creek, Mich.—The American Motor & Cycle Co., under Michigan laws, with $10,000 capital; to deal in automobiles. Corporators—C. G. Currie, F. Jay Rathbun and Charles E. Moore.

Boston, Mass.—Eco Mfg. Co., under Massachusetts laws, with $10,000 capital; to make and deal in generators and lamps. Corporators and officers—R. P. Elliott, president; J. S. Pishon, treasurer.

Columbus, Ohio.—The Ohio Garage & Repair Co., under Ohio laws, with $10,000 capital; to conduct general garage business. Corporators—G. W. Hale, J. O. Lundy, E. F. Gibbons, H. D. Merrick and I. D. Hogg.

Grand Rapids, Mich.—The Michigan Motor Co., under Michigan laws, with $150,000 capital; to make gasolene engines, clutches and accessories. Corporators—Fred L. Perkins, Harry J. Perkins, Charles E. Perkins and A. C. Hinchman.

New York City, N. Y.—Auto Auction Association of America, under New York laws, with $5,000 capital; to auction automobiles. Corporators—Charles Shongood, Lindsay Russell, Charles G. Wridgeway, Walter E. Coe and Robert J. Mooney.

Royal Gets Its License.

After the meeting of the Association of Licensed Automobile Manufacturers last week, it was officially announced that a Selden license has been granted to the Royal Motor Car Co., Cleveland, Ohio. The news that such action was likely was published exclusively in the Motor World several weeks since, and proved one of the trade surprises of the time. At the same meeting of the A. L. A. M. the license of the Worthington Automobile Co. was cancelled.

Kelsey Goes to Tarrytown.

C. W. Kelsey, formerly manager of the Kelsey Motor Co., of Philadelphia, has been transferred to Tarrytown, N. Y., as sales agent of the Maxwell-Briscoe Motor Co. William N. David, of Bridgeport, Pa., has assumed charge of the Philadelphia branch.

In the Retail World.

The Holmes-Schmidt Co., Chicago, Ill., has taken on the Glide and Maxwell cars for 1906. These will be handled in addition to the Welch.

Fank Linscott and H. Frederick contemplate building a garage at Belvidere, Ill. It will be located at the corner of South Main and Meadow streets.

The Ford Motor Co. has opened a New England branch at 147 Columbus avenue, Boston. Charles E. Fay, former assistant manager of the Winton Motor Carriage Co., is in charge of it.

The Motor Vehicle Co. has been formed at Newark, N. J., with William F. Kimber president and Alfred A. Walsh treasurer and general maanger. They have leased the store at 518 Broad street, and will handle Maxwell cars.

The Highland Automobile Co., of Pittsburg, Pa., has purchased a lot 100x150 feet on the north side of Centre avenue, near South Negley avenue, for $15,500. On it they will build a two story brick garage, costing about $30,000.

The Fisk Rubber Co.'s Boston branch has been removed to 239 Columbus avenue, the store formerly occupied by the Oldsmobile Co., and almost directly opposite its former location. Necessity for larger quarters required the removal.

The four story and basement garage at 215-17 West Forty-eighth street, New York City, has been leased for a term of years by the Viqueot Co. It will be used as salesrooms, repair shop and garage for the Viqueot gasolene car.

The new Foss-Hughes Motor Car Co., organized to handle the Pierce, Cadillac and Baker cars in Philadelphia, have located at 201 North Broad street; the store is within three blocks of the City Hall, and is one of the most favorably located in the city.

The American Motor and Cycle Co., which has just incorporated at Battle Creek, Mich., has taken over the business of the Currie Motor and Cycle Co. and the Losey-O'Reilly Co., and will conduct a general sales agency and garage business in the building heretofore occupied by the latter named firm at 35 East Main street. C. G. Currie, of the old Motor and Cycle Co., is president of the new concern, F. Jay Rathbun secretary and Charles E. Moore treasurer.

As the outgrowth of the Miller-Mundy Motor Ccar Co., the Consolidated Motor Car Co., of Utica, N. Y., has been organized, to sell automobiles and accessories and conduct a general automobile business. A commodious garage will be erected next spring, but the site has not yet been chosen. The cars handled will include the Pierce, Pope-Toledo, Stevens-Duryea, Winton, Cadillac and Pope-Waverly. At the election last week these officers were chosen: President, Francis P. Miller; vice-president, Edward Otis; secretary, Harry M. Mundy; treasurer, C. Harrison Norris.

WILL LIMIT LOCAL SHOWS

N. A. A. M. Decides to Restrict Sanctions and Explains How it Won't "Butt Into" Sport.

During 1906 there will be local shows only in those cities in which shows were held during the last year.

This was decided at the meeting of the executive committee of the National Association of Automobile Manufacturers at their regular monthly meeting in New York on Thursday last, 4th inst.

The association will not grant sanction for shows to be held in any other cities, and thus nips in the bud any aims and ambition to enlarge the annual "circuit." The N. A. A. M. considers that there are more than enough as it is, and that there is no necessity or demand, crying or otherwise, for any more. And such shows as will be sanctioned will obtain approval only on condition that the proceeds shall go to local organizations of dealers. It is further provided (1) that these organizations must not be "close corporations," but must admit to membership on an equal basis all reputable dealers who have been engaged in business for one year or more, and (2) that manufacturers must not be called on for financial assistance in the conduct of their exhibits.

Although it had been proposed in writing that a fine or penalty be inflicted on members of the N. A. A. M. who participated in road contests not approved by the organization, after last Thursday's meeting the manager gave out that an "erroneous impression" had been created. The manager makes this adroit explanation of the association's position in the matter: "The association does not expect to sanction such events. It will probably take into consideration the details of such as may be proposed and make a recommendation to its members. It will, of course, be glad to receive details of such contests as may be proposed."

Devlin Takes Possession of Acme.

The sale of the Acme Motor Car Co., Reading, Pa., to Frank A. Devlin, of Chicago, which has been pending for several months, finally has been consummated, and the new owner is now in full posession of both the plant and real estate. The purchase price is said to have been $250,000. While the production of touring cars will be continued, much attention will be now centred in delivery wagons and commercial vehicles generally. I. D. Lengel will remain as manager under the new ownership.

How Chicago is Oversold.

The N. A. A. M. will "have a time of it" in providing space at the Chicago show for all who wish to display cars. Up to Thursday last there were eighty-seven applicants who desire to exhibit 368 cars, and ask for 224 spaces aggregating 62,845 feet. As the number of spaces available is but 131, equal to 39,497 feet, the amount of pruning that will have to be done is evident. It was hoped to provide room for the overflow by erecting a temporary gallery in the Coliseum, but the Chicago Buildings Department vetoed the idea.

Preparing to Test Metals.

The experimental and test committee of the Licensed Association of Automobile Manufacturers are due to meet in Hartford on Friday at the laboratory of Henry Souther and will also visit the plants of the Electric Vehicle Co. and the Pope Manufacturing Co. Besides Mr. Souther the members of the committee are Messrs. Maxim, of the Electric Vehicle Co.; Wilkinson, of the H. H. Franklin Mfg. Co., of Syracuse, N. Y.; Huff, of the Packard Motor Car Co., of Detriot; Coffin, of the Olds Motor Works, of Lansing, Mich., and King, of the Northern Automobile Co., of Detroit.

The meeting will decide on the equipment necessary for the physical and chemical tests which will be conducted by the A. L. A. M.'s new testing department. In this connection it is stated that the Bethlehem Steel Co. has notified the association that it would send a metallurgist to Europe to study the material supplied to the constructors of the best makes of automobiles abroad, and would co-operate with the A. L. A. M. in every way possible.

Bankrupt Files its Schedule.

Paul E. Miller has been named as trustee for the bankrupt Western Auto Supply Co., of Milwaukee, Wis. His bond is fixed at $3,000. In the schedule filed by the bankrupt concern liabilities were given as $5,071.79, with assets of $7,163.83, of which $4,000, however, was the estimated value of the company's machinery. George E. Fisher, Henry Pritzlaff and Peter Cooper were appointed to act as appraisers of the property.

Parts Company Will Produce Cars.

Although it has been making automobile parts in a small way for some time, the Muncie Auto Parts Co., of Muncie, Ind., which was incorporated two weeks since, is ambitious, and intends to place a car on the market as soon as its factory is ready. Hugh L. Warner, the superintendent of the plant, has completed a working model of the car the company intends to manufacture.

Gaylor Back in Harness.

L. B. Gaylor, former manager of the Waltham Mfg. Co., has returned to the service of that company. His long absentation was necessitated by his health, which has been restored.

Winton Goes Abroad.

Alexander Winton sailed for Europe this week for a vacation trip in which will be included a visit to the Paris show in December.

TACKLES SECOND-HAND PROBLEM

Licensed Manufacturers in a "Touring Company" Which has Plans for Disposal of Used Cars.

What appears tangible evidence that the Association of Licensed Automobile Manufacturers has undertaken to grapple seriously with the vexing secondhand problem was unearthed yesterday in the guise of the Inter-State Automobile Touring Co., of No. 5 East 42d street, New York.

No. 5 is a part of No. 7 at that address and No. 7 is the address of the A. L. A. M. itself, in other words, No. 5 and No. 7 East 42d street are one and the same building. This was clue No. 1. It led directly to clue No. 2—that the Inter-State Co. is at present a partnership composed of W. E. Metzger, G. H. Stilwell and C. A. Wardle. Later it may become a corporation. It so happens that Mr. Stilwell is of the H. H. Franklin Mfg. Co., Syracuse, N. Y., and Mr. Metzger of the Cadillac Motor Car Co., Detriot, Mich. Wardle is the chief "sleuth" or roying representative of the Licensed Manufacturers.

Whether or not the "Touring" in the title of the firm implies developments of which there are no surface indications, it can be stated that the principal purpose of the Interstate Automobile Touring Company is to provide an outlet for secondhand cars of any and all makes and with none of the odium that so often attaches to that class of trade. It will seek to bring together those sellers and buyers who are in closest proximity to each other and to assist dealers in doing that sort of thing. A registration fee of $15 will be charged for each car it is desired to offer for sale and the money will be expended in advertising such cars extensively in trade and country papers, all such cars to be vouched for by affidavit. If John Jones of Podunk is known to be in the market for a car he will be placed in touch with Sam Smith of Squedunk, who has one for sale and who is located nearest to Jones. Similarly dealers with used cars for sale and those who desire to purchase such cars will be brought together.

In short, the Inter-State Co. appears to fill a bill which the Motor World itself long ago suggested—a reputable clearing house for secondhand cars.

Whipple Heads Auction Association.

The Automobile Auction Association of America, which was incorporated last week under New York laws, with C. G. Wridgway, manager of the Peerless branch in New York, as secretary, will aim to find markets for secondhand cars and to relieve auction sales of the odium that usually attaches to them—somewhat on the order of Friswell's, in London. The fact that Harlan W. Whipple, former head of the American Automobile Association, is president of the new auction concern, will serve to commend it favorably.

The Constructive Principle of Fisk Tires Involves

A Technique So Simple in Manipulation and So Positively Accident-Proof

that it should readily appeal to any discriminating purchaser.

Beads of a wedge shape are applied to a flat rim and held by rings which are rolled on an angle corresponding to that of the bead, so that when drawn down by clamping bolts, the bead acts as an inside cone wedge, with the result that the tire is firmly held to the rim, without air pressure or circumferential contraction.

A Tire so Locked to the Rim Incorporates a "Life Preserving Principle" and Reduces Tire Maintenance to an Economic Basis.

CADILLAC Salability

Here's the 1905 Sales Record of one of the principal cities of the Central States (Population about 300,000):

	No. Lines Handled	Total Cars Sold
Dealer No. 1	two	12
Dealer No. 2	two	11
Dealer No. 3	four	4
Dealer No. 4	four	1
Dealer No. 5	two	2
Dealer No. 6	one	6
Dealer No. 7	one	0
Dealer No. 8	one	4
Dealer No. 9	two	0
Dealer No. 10	one	2
Dealer No. 11	two	1
Total Sales by above Dealers		43 Cars.

THE CADILLAC DEALER SOLD 51 CADILLACS

or about 15 per cent. more Cadillacs than the sales of all the other dealers combined.

There's a reason for this and it's not hard to guess it.

We're talking 1906 Business.

CADILLAC MOTOR CAR CO. - - - - Detroit, Mich.

Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to THE MOTOR WORLD PUBLISHING COMPANY.

General Agents: The American News Co., New York City, and its branches.

☞Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

☞Those who are interested in motor vehicles will find the facilities and information of our office always at their command.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, NOVEMBER 9, 1905.

Suppressing the Drunks.

It does no harm to rail at and to oratorically lambast the offending chauffeur as was done by President Morris of the Automobile Club of America in his address to the New York Y. M. C. A., but it well may be doubted that it does any good. It will require something more than tongue lashing to bring about reform in the young man's manners.

That three-fourths of the serious accidents are due to the antics of the hired men, and that their antics are due to wine or women, usually both, are alike almost beyond doubt. But, as was the case in the slightly veiled personal instance recited by Mr. Morris, the owners of the cars in surreptitious use by recalcitrant chauffeurs are content merely to discharge the offenders, who simply "flit from job to job," with apparently no idea of culpability or responsibility.

The number of accidents growing out of the midnight carousing of chauffeurs has, if anything, increased rather than diminished since the law of New York State provided what was hoped would prove a check on the frisky young persons. No owner has arisen to invoke the aid of that law, which inflicts a penalty for the use of a car without the owner's permission. Even when a car paid for by the city of New York and used by a city official was wrecked by its drunken driver returning from a midnight spree with two women companions he escaped with a $5 fine. Only last Sunday night we saw one of his kind guiding a car with one hand while the other arm was around the waist of a snip of a girl. The only occasion when a serious effort was made to put one of the most flagrant of these offenders in jail "influence" was brought to bear on the court, and the man was summarily dismissed before the prosecutors had opportunity even to offer their evidence.

While this sort of thing continues—while owners remain lenient and courts remain complaisant, there is no hope for a better ordered state of affairs. Chauffeurs will continue to use their employers' cars in which to disport their "lady friends" after dark; whiskey will continue to go to their heads, and saddening accidents will continue to occur. It matters little that most of the chief physical sufferers have been themselves the offenders, for in saving the drunken driver from himself the innocent public also is saved.

Not merely discharge from employment, but a stiff dose of jail is the only cure for such drunks, and until a few owners arise and make use of the weapon which the law places in their hands no abatement of accident is possible or is to be expected.

Concerning Price Cutting.

One of the most vicious practices which is to be found in any trade is that of miscellaneous price cutting by the retailers without the knowledge or express consent of the manufacturers. To the retailer it may at times be of greater or less benefit in the way of advertising, or as a means of disposing of the residue of a season's stock in trade, to adopt the bargain counter policy, and, of course, there are occasions when a special "job" or bankrupt stock can best be got rid of by such a method. In any case the inevitable result must be that the further salability of that line at its former price is put out of the question for all time.

Despite the most strenuous efforts on the part of manufacturers' and dealers' associations, this practice still continues to a greater or less extent, and frequently enough the maker is brought face to face with the question, "How can it be stopped?" That summary dealing cannot fail to accomplish something in the right direction goes without saying, provided, of course, that the penalty be severe enough to make its permanent mark upon the offender.

A single manufacturer of parts in Great Britain has undertaken something of that nature by the establishment of a blacklist. A retailer of the bastard type who had been advertising his goods at rates which did not permit of legitimate profit under any circumstances may now seek elsewhere for his stock, for henceforth he will gain no recognition from the offended maker. It is conceivable that, taken in an isolated case of the sort in question, the maker and not the dealer might lose in the long run. But were all allied makers to combine to adopt the same policy the downfall of the charlatan would be quite as speedy as certain.

Eliminating the Clutch.

Alluring as are the possibilities offered by a generator-motor set as a flexible and infinitely variable means of transmitting the power to the rear axle and numerous as the attempts have been to adopt it to the car, little or no practical result appears to have been forthcoming. So far as efficiency is concerned it presents no great disadvantages as the majority of systems evolved thus far have all provided a means of direct driving on what corresponds to the high gear, so that in this, which is in use nine-tenths of the time, it is equivalent to the mechanical form. On intermediate and low speeds its efficiency is not alone relatively high but, being infinitely variable as to speed range the power of the motor may be utilized to better advantage than when the speed is of necessity confined to a few changes.

This refers more particularly to those systems of electrical drive, in which the storage battery does not enter in any way as a component part. When the current is accumulated as energy in chemical form and again given off as required, the loss is, of course, greater, and the percentage of efficiency correspondingly lower than when electricity is merely depended upon to form a link in the transmission. In such cases it not only displaces the change speed gear—a weak spot in the motive power of the average car—but eliminates the clutch as well. Many of the forms proposed have contained most ingenious combinations, and it is noticeable that a number have been made the subject of patents, although with probably a single exception, none have ever reached the market, and doubtless very few have progressed beyond the draughting board. That the idea

Digitized by Google

is one that appeals very strongly to inventors on both sides of the Atlantic is apparent from its frequent recurrence in some form or other in the patent records.

Apart from its transmission, cars embodying this feature do not differ in any other way, and, so far as outside appearances go, look quite the same. The location and detail of the motive power are identical, the four cylinder vertical engine being given the preference owing to its even balance. In place of the clutch a multipolar generator of practically the same diameter as the part it displaces is coupled directly to the end of the main shaft. On this point all the systems thus far proposed are in accord; the source of energy and the manner of its generation vary but little, even in detail. The next essential is the electric motor, and in the earliest system of the kind exploited this was placed directly in line with and but a few inches behind the generator, but was in no way mechanically connected with it. The plan of arrangement adopted in this instance has been followed in many that have followed it, and may well be said to offer the acme of simplicity—the change speed gear box simply being displaced by an electrical motor, all other parts of the mechanism remaining the same.

But later systems have taken account of the fact that the electric motor may at some time or other succumb to the force of circumstances, and have accordingly provided a mechanical means of effecting the drive with both generator and motor running dead. Except in such cases of emergency the current is depended upon entirely, and some of the combinations upon which patents have been granted are sufficiently ingenious to warrant further investigation of their merits in practise.

In place of the usual change gear levers and clutch pedal an electric controller is substituted, supplemented, of course, by the usual provision in the shape of throttle and and ignition levers for controlling the motor. By means of this, and a bank of resistances, a wide range of speed is afforded, with, in some cases, a mechanical direct through drive on the highest. In addition to providing a number of stops by means of resistance the controller also makes it possible to effect various combinations directly between the generator and motor, such as throwing their filled windings in series or parallel, raising or lowering the voltage through the filled resistance of the generator, and similar means of obtaining reduced speed without the necessity of dissipating any considerable percentage of the electrical energy developed. From the motor the transmission is by means of the regulation cardan shaft and live axle.

Other systems have been even more ambitious in the elimination of the mechanical devices now commonly used for conveying the power from the motor to the road wheels, and have, by the addition of another motor and a plan of arrangement by which each is located at and directly coupled to its driving wheel, succeeded in doing away with everything from the clutch to the differential, even including the live axle. But this, of course, precludes the possibility of using any mechanical connection in cases of emergency, as provided for in the system employing a single motor in place of the change speed gear box. The factor of reliability is, however, one of the very strong points of the electric motor, so that the value of the mechanical standby is somewhat overrated. But, on the other hand, it provides a through drive on the high speed, which permits of attaining a rate of travel far in excess of the capacity of the generator and motor to stand for any length of time, as the latter run idly under such conditions.

Later developments of this class have usually included a set of accumulators, either as a reserve or for starting purposes, or, as a step in the transition of the power from mechanical to electrical and back again, in which case they are but replicas of those already in use.

Improvement of Bodies.

In view of the present luxuriousness of design and finish lavished upon the up-to-date automobile body, it is interesting to look back a few years at the crudity from which it has been evolved. It was not until the carriage builder awoke to the possibilities of the car as a field for future expansion that the matter of body design came in for any attention at the hands of those skilled in the art. In its inception the motor car literally represented its title of horseless carriage, for it was a runabout or buggy sans shafts, equipped with a gasolene engine carefully concealed, with a view to disturbing its original outlines as little as possible.

Two or three years were required in this country to fully demonstrate the fact that more than the elimination of the animal power and the substitution of the mechanical was necessary to arrive at the successful motor driven vehicle. On the Continent, the buggy, with its towering wheels, was quickly discarded. Its total unfitness for the purpose and the impossibility of adapting it to the new means of locomotion were promptly recognized. Its height, overwide tread and utterly inadequate wheel base shortly made themselves felt, and the result has been the evolution of a type hitherto unknown.

In France, as in other countries, the high-wheeled buggy was the forerunner of the present day type. But it very soon gave way, and such builders as the Panhard and similar concerns early took the lead with the dogcart type, having the vertical motor located under the bonnet, and with the driving wheels considerably larger than the forward pair. This marked a great advance, although its short wheel base was not recognized as its greatest drawback at the time; nevertheless, in its day, this not only represented the acme of modern design, but formed the prototype of its successors which have come down to the present greatly improved in many ways and luxurious, beyond the wildest dreams of a few years ago, but still on exactly the same general lines as the dumpy little rear entrance dogcart models.

How little this crude original has been departed from, however, and how well adapted were its lines for the unusual exigencies of the then new art of motor propulsion may be realized when it is stated that the relegation of its hearse-like rear entrance to oblivion is the only fundamental change that has been wrought in its design.

Nor are these dog carts utterly a thing of the past by any means, for there are several in continual use about the streets of New-York at the present day. They do not look modern to the initiated eye by several years, but to those that are unfamiliar with the course of development in that time they are not such an incongruous sight as are some American models of but a year or two back.

They were of course the product of the same factory that built everything pertaining to them except the tires, for at first the carriage builder was in a quandry as to where to begin. No two cars were alike, and their dimensions differed as radically as their appearance, so that it is hardly to be wondered at that this field did not appeal very strongly to the manufacturer who had hitherto devoted his entire time and attention to horse-drawn vehicles. It is hardly necessary to comment on the revolutionary change that has been brought about in the mean time; its effect on the appearance and comfort of the car are everywhere apparent, the carriage maker is now very much of a factor in the construction of the completed vehicle.

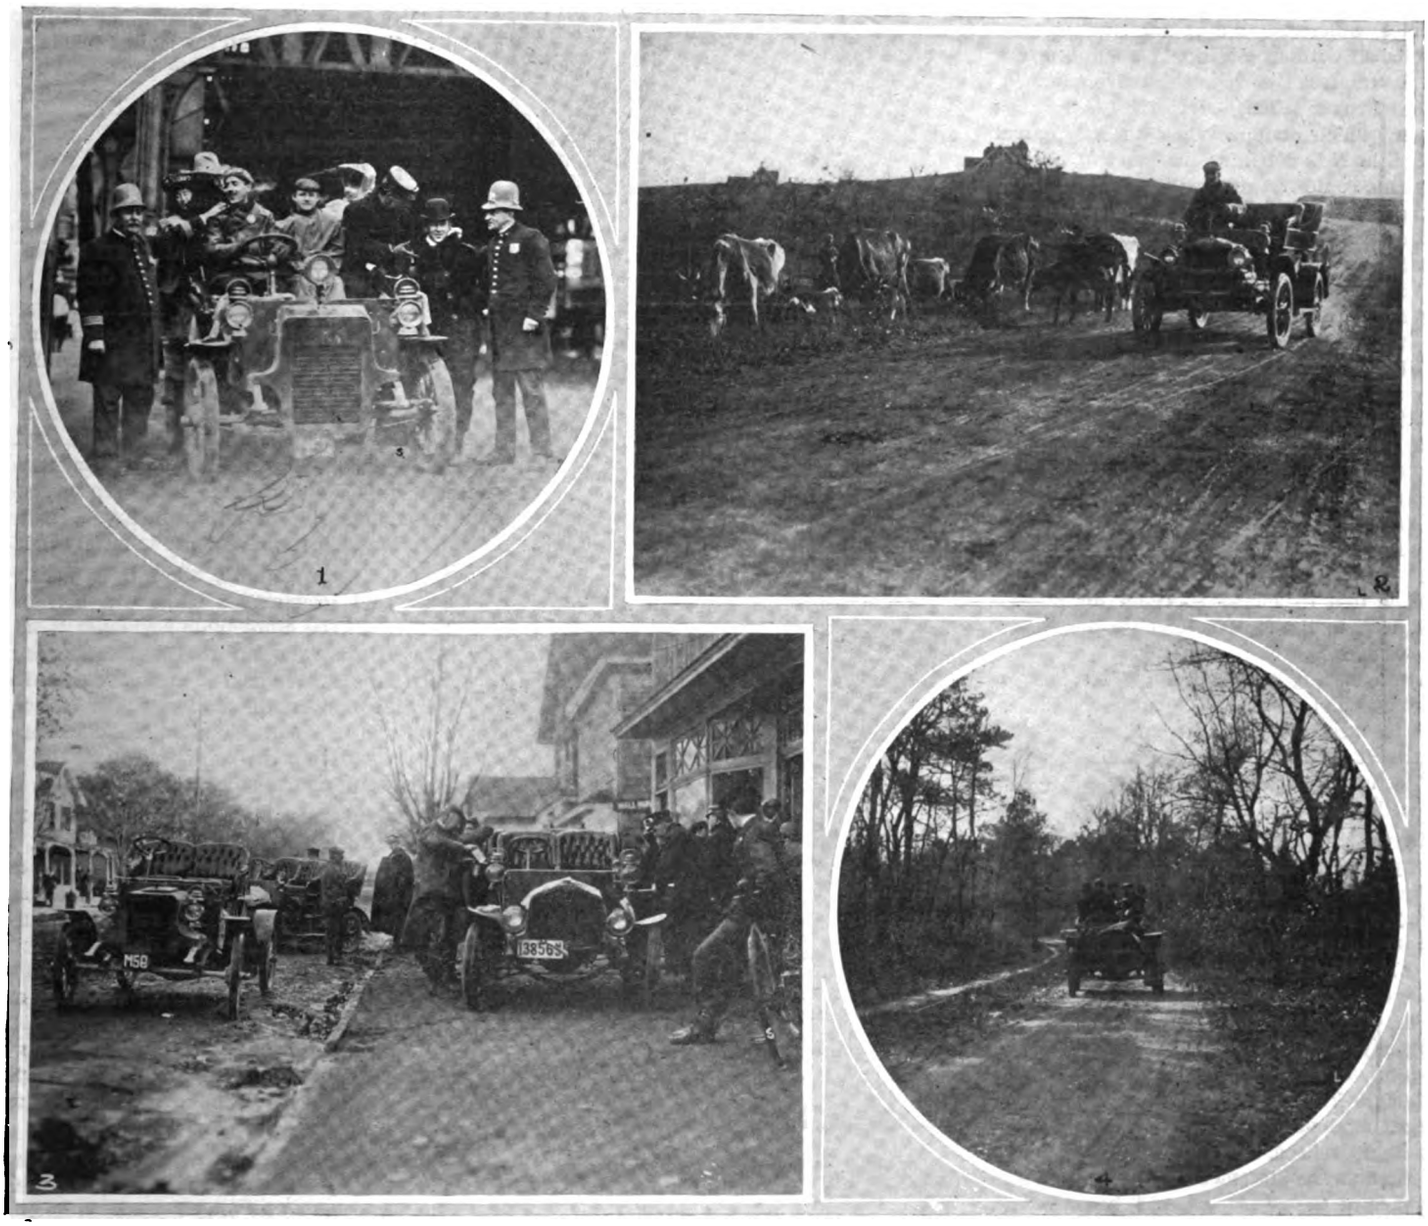
ECONOMY TEST IS ENDED



But Only Approximate Results Are Known—They Put Railroad Rates to Blush.

Although the so-called national economy test promoted by the New York Motor Club was completed last Saturday night, detailed figures of the results are still lacking, and will not be made public until about Saturday of this week. Such statistics as have been published are merely "rough figures." It is safe to say, however, that honors will be easy and "winners" numerous. Seven out of nine cars finished the test, and if the original plan of division into several classes is adhered to, there should be awards for practically all contestants.

Not unnaturally, the 16-horsepower Reo bus, with its capacity of ten passengers, made the best per capita showing, completing the 682 miles at a total cost per passenger of $2.93, as compared with the railroad fare for the same distance of $14.53 per passenger. The 20-horsepower Marmon, the least economical of the survivors, made the trip at a per capita cost of $4.586.

The test started last Monday, 30th ult., and, as told in last week's Motor World, the first three days' run comprised a round trip to Philadelphia and to Albany. Thursday's journey, from Albany back to New York, was made without incident. The Marmon car made the 150 miles trip in the best time, 8:38, enced tire troubles. The Compound, C. P. time, with 9:35. Two of the cars experienced tire troubles. The compound, C. P. Hatch, driver, had to replace an inner tube, while the Wayne was charged 12½ cents for repairing a slight puncture. The cost per passenger for the day's run was announced as follows: A. L. Kull (Wayne), 30.4 cents; A. Largensen (Marmon), 35.4 cents; C. C. Singer (Reo), 41.4 cents; F. Monroe (Olds), 41.4 cents; E. H. Hatch (Compound), 48.5 cents; F. C. Carter (Compound), 59.9 cents, and R. L. Lockwood (Reo bus), 68.6 cents. In the total test for five days the standing of the cars follows: 1, Reo runabout; 2, Reo bus; 3, Compound (Carter); 4, Compound (Hatch); 5, Marmon; 6, Oldsmobile; 7, Wayne.

On the trip to Albany the previous day the hard luck of D. T. Graham, who drove one of the Compounds, pursued him. The Compound had broken an axle sleeve on the first

day's run to Philadelphia, but Graham had repaired it in time to start on the Albany run. It reached Cold Spring, and in going down a hill the brake refused to work. Graham drove into a ditch to avoid a collision with a team coming uphill. An axle was bent, and Graham decided to give up the fight.

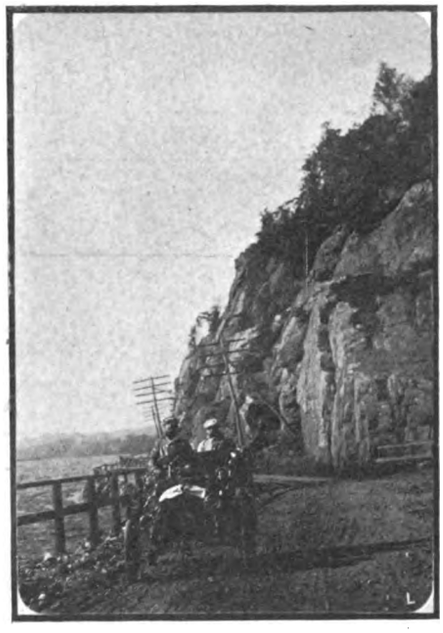
Friday's and Saturday's runs comprised a journey to Southampton, L. I., and return, a total distance of 202 miles. C. P. Hatch, in the Compound, again experienced minor tire troubles, otherwise the round trip was accomplished without mishap. No figure of the cost for the last two days were given out.

The Frayer-Miller car, driven by Lee Frayer, which stripped its gear at Central Bridge, in New York, at the start of the Albany run, could not repair it in time to figure in the contest. It, however, completed the Southampton run and made an excellent showing for the 480 miles it covered. For the four days it remained in the contest only $6 worth of gasolene and 55 cents worth of oil was consumed. As it missed the Albany run it will not have a finger in the awards.

By the semi-official table reproduced below, it will be seen that the best showing was made by the 10-passenger Reo. Its total consumption of gasolene and oil during the six days cost, respectively, $16 and $3.38¾. The total costs were $29.30, averaging $2.93 per passenger, as against $14.53, the railroad fare. The Reo runabout used $8 worth of gasolene and expended 25 cents for oil—at least, that is the report—and its per capita cost was $3.38½.

In the touring car class the 15-horsepower Compound, driven by F. C. Carter, made perhaps the best showing. It carried five passengers at an average cost of $3.72½, while the Wayne, A. L. Kull driver, was a close second with $3.96.3.

The only protest lodged with the referee was by Alfred Comacho, on behalf of the Reo Motor Car Co. On the third day's run, to Albany, the observer on the Reo bus reported that on a steep hill the engine failed to pull the car, and that six of the passengers had gotten out and given it a "boost." The referee decided that each of the six should be charged for fifteen minutes' labor, and that the total should be doubled to make up for the weight lessened. This amounted to $2.25 charged against the bus. Mr. Comacho was very angry indeed, and lodged a written protest against the statement of the facts. The language of the report, he said, he especially objected to rather than the penalty imposed.



"We were on a steep, sandy hill," said he, "when our clutch failed and we started to back. Three of us jumped out, and to save life I blocked the wheels with a stone. All this time, though, our engine was running. We had had no trouble in negotiating any hill we had encountered. It was the fault of the clutch and not of the motor."

He later withdrew the protest when he found the charge of $2.25 would not cause the bus to lose the trophy.

A TRIO OF OFFICIALS.

As said before, each contestant that completed the pleasure trip ought to be well satisfied. Besides the trophy offered to the car, irrespective of class, making the most economical showing, innumerable medals are offered for finishers in the various classes, not including individual prizes and engrossed certificates, of which there are not a few.

ON THE ROAD TO ALBANY.

The subjoined table is the semi-official summary for the six days furnished the press, but in the "cost per mile" the figures do not work out uniformly:

Car.	H. P.	Driver.		Gas cost.	Oil cost.	All. costs.	Cost per pas.	Cost per mile.
Reo bus	16	R. L. Lockwood	10	$16.00	$3.83¾	$29.30	$2.93	.042 9-10
Reo	8	C. C. Singer	4	7.99½	0.25½	13.54	3.38½	.049 3-5
Compound	15	F. C. Carter	5	10.87½	2.12	18.627	3.72½	.054 3-5
Wayne	20	A. L. Kull	5	12.40¾	2.10	19.815	3.963	.058
Olds	8	F. Munroe	4	10.35¾	0.42	15.86	3.965	.058
Compound	15	C. P. Hatch	4	10:34¼	2.13	17.185	4.296	.062 9-10
Marmon	20	A. Largenson	5	14.82⅛	1.40	22.91½	4.583	.067 1-10

Morris Discusses Chauffeurs and Speed.

Dave Hennen Morris, president of the Automobile Club of America, knows of a chauffeur in New York who receives a salary of $6,000 a year for his services. He said so before 300 students of the Y. M. C. A. automobile school on the occasion of the opening of its second year, on November 1, when he was called up to make the inaugury address. Mr. Morris did not give his name nor state that jobs of that sort are readily to be found. In fact, he intimated that they are not, and instead of holding out roseate pictures of a life of idleness and prosperity to the neophytes, proceeded to score quite roundly the existing type of chauffeur and the customs which hedge him about. Finally, he pointed out the fact that for an honest, sober and trustworthy man, well schooled in his work, there is an ample opportunity, but said that a man who intended to drive a car must not drink.

"About two years ago," said Mr. Morris, "I stated that nine-tenths of the automobile accidents were due to drunken chauffeurs. I have been called prejudiced because I had an unfortunate experience myself, as a result of which I had to pay for some expensive repair to my machine and now have a suit of $5,000 damages. But I see no reason to change my assertion to-day. . .A man who is going to drive a car must not drink."

"I believe," he said, "that it is positively true that drunkennes is at the bottom of nearly all the automobile accidents." Then, turning is attention to the existing speed law, he characterized it as being a bad one in that it virtually makes every driver of a car guilty of its violation, inasmuch as no one can drive a car continuously at the minimum rate of ten miles an hour.

"The average speed," added Mr. Morris, "is between fifteen and eighteen miles, and that is sufficient. That speed corresponds to ten miles with a horse—that is, an automobile at eighteen miles an hour can be controlled as readily as a horse going ten miles. If you are arrested don't tell the policeman he is in error, for the fact of it is we are all guilty. A law, therefore, that can't be obeyed is a bad one, and it is absurd to arrest a person for technical violation of the law. I hope to see it changed very soon."

Mr. Morris also took occasion to score the use of acetylene lamps in the city, condemning the practice as both dangerous and useless. Their usefulness in the country in lighting the road ahead he commended, but said that in the city where there is but little danger of running into pitfalls, their blinding light tends to bewilder pedestrians and cause accidents.

By way of conclusion, he attacked the subject of graft, saying that a few years ago the worst man he could think of was the plumber, then the electrician, and finally the chauffeur. "But I don't think so now," he said, and closed with a little admonition against the practice.

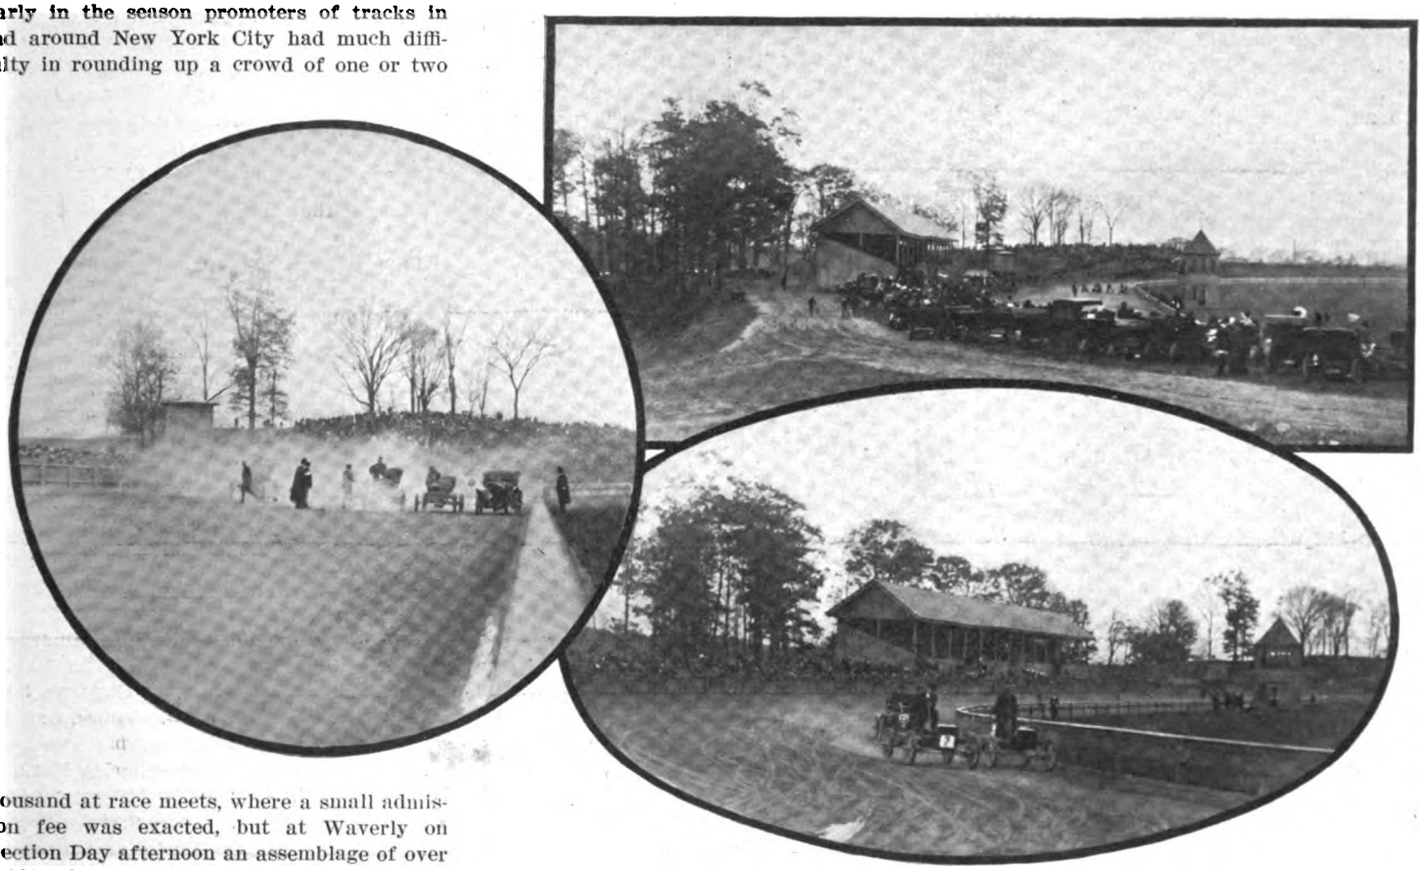
NEWARK HAS A FREE SHOW

Tremendous Crowd Turns Out and Sees Oldfield and Other Men and Things.



"Were the devil to say everybody can come to hell, it's free, I expect there would be many persons accept the offer just for that reason," was the observation of one onlooker at the third race meet of the New Jersey Automobile and Motor Club at Waverly Park, Newark, N. J., on Tuesday afternoon, 7th inst. While the remark savored somewhat of relevance, it seemed not altogether malapropos. Early in the season promoters of tracks in and around New York City had much difficulty in rounding up a crowd of one or two thousand at race meets, where a small admission fee was exacted, but at Waverly on Election Day afternoon an assemblage of over 12,000 witnessed the contests. In the latter case the meet was free.

That the meet was a success is unquestionable, and although the open events were confined to stock cars they were exciting. The police arrangements were perfect. Four well known cracks were there, and treated the immense crowd to exhibitions. Barney Oldfield was resplendent in all his glory, and blazoned forth in a brand new suit, with hat, shoes, scarf and gloves to match. The crowd did not recognize Barney when he drove on the track, probably due to the fact that the Green Dragon driver has changed the shape of the cigar he invariably has stuck in one corner of his countenance. Instead of the usual breva-shaped "stump," Oldfield dry-smoked a cigarette. When the Motor World man asked the Peerless driver his reason for the cigar change he replied:

"Oh, you see the little one offers less wind resistance."

It apparently made little difference in this case, for Oldfield drove two miles in 2:24¼. The first mile was made in 1:12½. It was announced as a new record for a half mile track, but when some of the newspaper men asked W. J. Morgan—he had the programme privilege and a few others—what the old record was, the "honorary" member of the N. J. A. & M. C. did not know. Secretary Batchelder, of the A. A. A., smiled, but did not contradict the promoter.

Maurice Bernin, in the inverted boat-shaped Renault, treated the crowd to a four-mile exhibition. Bernin was chary of the turns, but showed great speed on the stretch, which caused some wag to exclaim:

SCENES AT NEWARK'S FREE RACEMEET.

"Gee, look at Maurice Bernin up the track!"

The wag was the fat and jovial Bernard M. Shanley, who, notwithstanding that he never waved the flag in the right lap, always fired the pistol at the wrong time and displayed a remarkable degree of omnipresence—made an ideal starter.

Montague Roberts, in the rejected Thomas racer, drove three miles against time in 3:46¼, and C. F. Warren, of Boston, in the Grout steam car, was carded to go three miles, but the steam car refused to do two miles better than 3:25½, so it sufficed.

The real feature of the afternoon's sport was the surprising work of the 22-horsepower Buick and the Maxwell runabout. The Buick finished first in three open events, and second in a handicap, while the 16-horsepower Maxwell scored two seconds over cars of twice the power, and crossed the tape first in the handicap. H. Fleming, the driver of the Maxwell, demonstrated that judgment in a race is a factor as well as speed. In every event that the Buick went ahead Fleming kept his little car so close behind the larger car as to reduce the wind resistance to the minimum, enabling him to get placed so many times.

There were four starters in the five-mile handicap for motorcycles, which was won in runaway fashion by P. Drummond, astride a 1¾-horsepower Indian, with 45 seconds handicap. J. I. Marion, 1¾-horsepower Indian, from the same mark, came in second, and C. H. Lane, 5-horsepower Curtiss, from scratch, finished a close third. Time, 7:49. The summaries:

Five miles, handicap, motorcycles—P. Drummond, 1¾ Indian (0:45), first; J. I. Marion, 1¾ Indian (0:45), second; C. H. Lane, 5-horsepower Curtiss (scratch), third. Time, 7:04.

Three miles, for stripped single cylinder cars—T. M. Uppercue, 9-horsepower Cadillac, first; M. Apgar, 9-horsepower Cadillac, second; F. L. C. Martin, 8-horsepower Oldsmobile, third. Time, 4:53.

Five miles, free for all: First heat (three miles)—Stanley Atkinson, 12-horsepower Franklin, first; Harry T. Deane, 12-horsepower Franklin, second; H. Fleming, 10-horsepower Maxwell, third. Time, 4:47. Second heat (three miles)—H. J. Koehler, 22-horsepower Buick, first; Q. H. Plank, 16-horsepower Reo, second; Perry E. Hall, 15-

Digitized by Google

horsepower White, third. Time, 4:37⅘. Final heat—H. J. Koehler, 22-horsepower Buick, first; H. Fleming, 9-horsepower Maxwell, second; Stanley Atkinson, 12-horsepower Franklin, third. Time, 7:37¼.

Five miles, for touring cars, regularly equipped, carrying four passengers—H. J. Koehler, 22-horsepower Buick, first; C. F. Warren, 28-30-horsepower Grout, second; Harry T. Dean, 12-horsepower Franklin, third. Time, 8:03¼.

Five miles, open—H. J. Koehler, 22-horsepower Buick, first; H. Fleming, 10-horsepower Maxwell, second; Stanley Atkinson, 12-horsepower Franklin, third. Time, 7:38½.

Five miles, handicap, for club cup—H. Fleming, 10-horsepower (0:15), first; H. J. Koehler, 22-horsepower Buick (scratch), second; C. F. Warren, 28-30-horsepower Grout (0:45), third. Times, 7:46, 7:35 1-5.

Two miles against time—Barney Oldfield, 60-horsepower Peerless. Time by miles, 1:12½, 2:24¼.

Three miles against time—Montague Roberts, 60-horsepower Thomas. Time by miles, 1:15½, 2:31, 3:46¼.

Four miles against time—Maurice Bernin, 60-horsepower Renault. Time by miles, 1:18¼, 2:36½, 3:52½, 5:08¾.

Two miles against time—C. F. Warren, 40-horsepower Grout steam car. Time by miles, 1:42½, 3:25½.

St. Louis Councilmen Go Daft.

In St. Louis, Mo., hotbed of arrent motorphobia, the City Fathers have been thrashing out a bill which is intended to effectually "do" any and all who have the timerity to drive a motor car. It is framed with the intention of changing the present penalty for violation of the ordinances from a fine to a term of imprisonment in the workhouse. In reciting the kinds of vehicles affected the ordinance names any "automobile, locomobile, motor carriage or horseless carriage, whether driven by steam or electric power." The only two delegates in the august body who own machines combined to oppose the measure on the ground that it was couched in terms which would make it include locomotives. Their motion was, however, declared "out of order," and the bill was passed to a second reading.

A. C. A. Renominates Morris.

Dave Hennen Morris has been renominated for the presidency of the Automobile Club of America. The other nominations are: For first vice-president, Colgate Hoyt; for second vice-president, Frederick G. Bourne; for third vice-president, Clarence Gray Dinsmore; for treasurer, W. S. Fanshawe; for governors to serve three years, Colonel John Jacob Astor, George F. Chamberlin, Schuyler Skaats Wheeler; for governor to serve two years, William Pierson Hamilton; for governor to serve one year, John E. Bourne.

They have even applied a gasolene engine to a road roller. One of the machines is in use in St. James Park, London.

CLEMENS'S FAST HUNDRED

Sets up New Record after Nip and Tuck Race at Indianapolis's Much Postponed Meet.

Full of distinction was the automobile race meet run off at the mile Fair Grounds tract at Indianapolis, Ind., by the racing association of that city last Saturday, 4th instant. Primarily, it was distinctive as the most deferred race meet ever held—it had been postponed five times on account of the sulkiness of one of the motorists' enemies, Jupiter Pluvius—and also because an American car, specifically the National, lowered the record for 100 miles; thirdly, it marked the first appearance in competition of the 100-horsepower Premier which was built for but did not compete in the Vanderbilt cup race. Incidentally a car executed the fence plunging act without injury either to itself or the driver.

In point of competition the meet was one of, if not the best, held this season, sensational finishes marking most of the events. The attendance had probably been materially diminished by the many postponements, and not over 1,500 people were assembled in the grand stands. Small attendance does not necessarily denote lack of enthusiasm, as was well demonstrated throughout the afternoon.

The surface of the track was in perfect condition when, shortly before 12 a. m. the five drivers—W. F. Clemens (30 horsepower National), Charles Merz (30 horsepower National), Fred. Tone (16 horsepower Marion), Frank Moore (16 horsepower Maxwell) and Ray McNamara (16 horsepower Premier)—breasted the tape for the 100-mile run, the feature event of the day. The Marion car experienced tire troubles after twelve miles of the century had been completed and dropped out of the running. Shortly after the Maxwell hit for cover, and this left three cars to fight it out for honors.

This was undoubtedly the closest race that has ever been witnessed. The phrase, "They're all alike," is well applied to the National cars. For exactly eighty-three miles they raced hub and hub, neither being able to gain a yard on the other. At the end of the eighty-third mile Merz was compelled to stop to replace a tire, losing a few minutes. Merz continued, and it was in the ninety-fifth mile that the only accident occurred. When rounding into the stretch of this mile one of the rear tires gave way and both driver and car crashed through the fence. He pluckily held his seat, and before the crowd realized what had happened was "hoofing" it for the judges' stand, minus a scratch. That Merz has plenty of grit was afterwards evidenced. When his car was fixed up he entered all the other events for which it was eligible.

Clemens finished the century in 1 hour 58 minutes 21 4-5 seconds, thus eclipsing Guy Vaughn's record of 1:56:39 made on the Empire track, New York, early in the summer, by 3 minutes 17 1-5 seconds. McNamara, in the Premier, finished in 2:35:31.

Clemens and Merz had another neck and neck fight in the five open. In this Merz took the aggressive and manipulated his clutch better than his opponent, so that he drew a lead of ten yards at the start, which he maintained until the last half of the fifth mile, when Clemens moved up to his front axle. The two crossed the tape scarcely three feet apart, Merz leading. Merz also came to the fore in the five mile "owners' race," and the three mile novelty.

Honors in the other events were equally distributed between Carl Fisher and Ray McNamara, both of whom drove Premiers. The last named driver captured the five mile handicap and an oven event at the same distance, and Fisher, in the intended 100 horsepower Vanderbilt car, drove a five mile exhibition in something approaching a "mile-a-minute" clip and won a special five mile handicap from scratch.

Very clever work in the matter of handicapping was made apparent in this latter event. Fisher was given the honor mark, the two Nationals were given 55 seconds and the stock Premier 1 minute 18 seconds. The race was gruelling, and Fisher overhauled all but Merz. He "nailed" him right at the tape, winning out in a driving finish by less than a yard. The summaries:

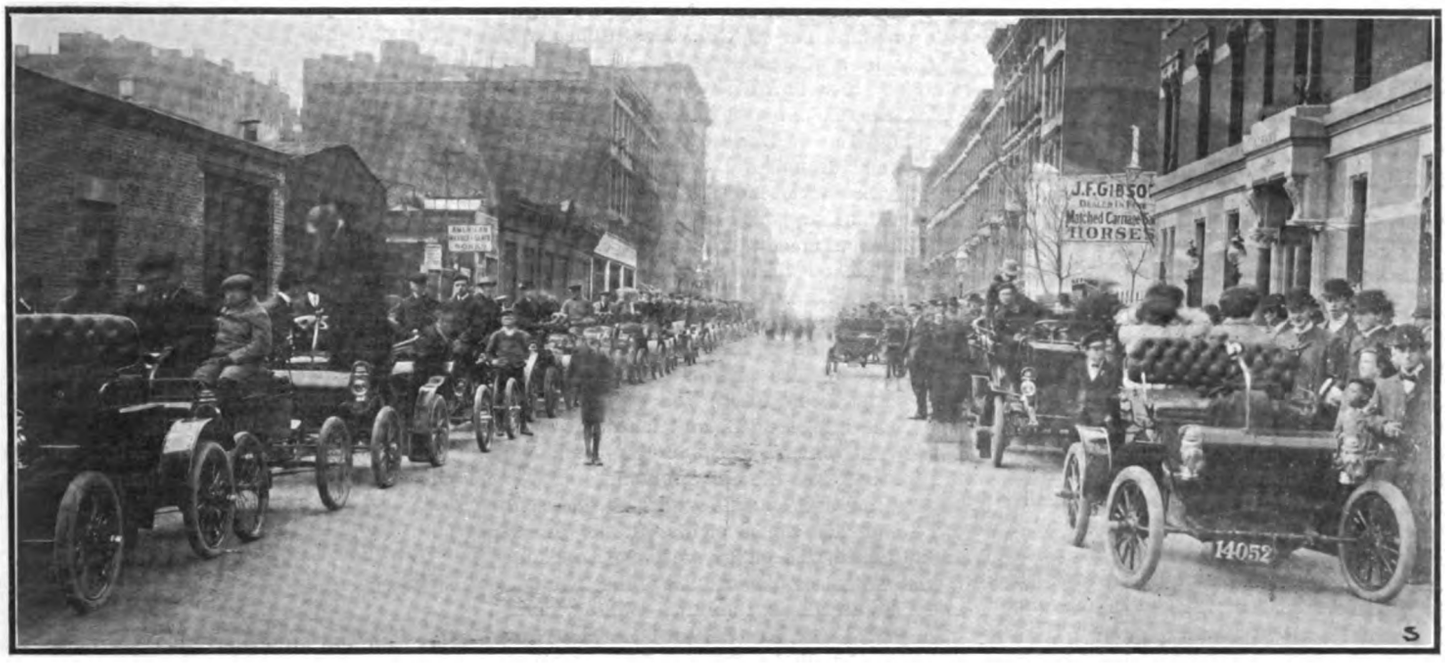
One hundred miles, for stripped tock cars—W. F. Clemens, 30 h. p. National, first; Ray McNamara, 16 h. p. Premier, second. Times, 1:53:21 4-5, 2:35:31.

Five miles, handicap—Ray McNamara, 16 h. p. Premier (1:10), first; Fred Tone, 16 h. p. Marion (0:20), second; W. F. Clemens, 30 h. p. National (scratch), third. Times, 8:03 4-5, 8:25 3-5.

Five miles, for owners—Charles Merz, 30 h. p. National, first; J. A. Allison, 20 h. p. Pope-Toledo, second. Time, 6:31.

Three miles, novelty for touring cars fully equipped, carrying three passengers, unloading and loading at each quarter—Charles Merz, 30 h. p. National, first; Dan Teeton, 16 h. p. Marion, second; Harry Hammond, 16 h. p. Premier, third; J. A. Allison, 20 h. p. Pope-Toledo, fourth. Time, 8:44 1-5.

Five miles, for middle weight stripped stock cars—Ray McNamara, 16 h. p. Premier, first; Fred Tone, 16 h. p. Marion, second. Time, 6:47.



Five miles, open—Charles Merz, 30 h. p. National, first; W. F. Clemens, 30 h. p. National, second; Ray McNamara, 16 h. p. Premier, third. Time, 5:49 3-5.

Five miles, special handicap—Carl Fisher, 100 h. p. Premier (scratch), first; Charles Merz, 30 h. p. National (0:55), second; Ray McNamara, 16 h. p. Premier (1:18), third; W. F. Clemens, 30 h. p. National (0:55), fourth. Time, 5:24 3-5.

Five miles, against time—Carl Fisher, 100 h. p. Premier. Time, 5:05 3-5. Fastest mile, 1:00 4-5.

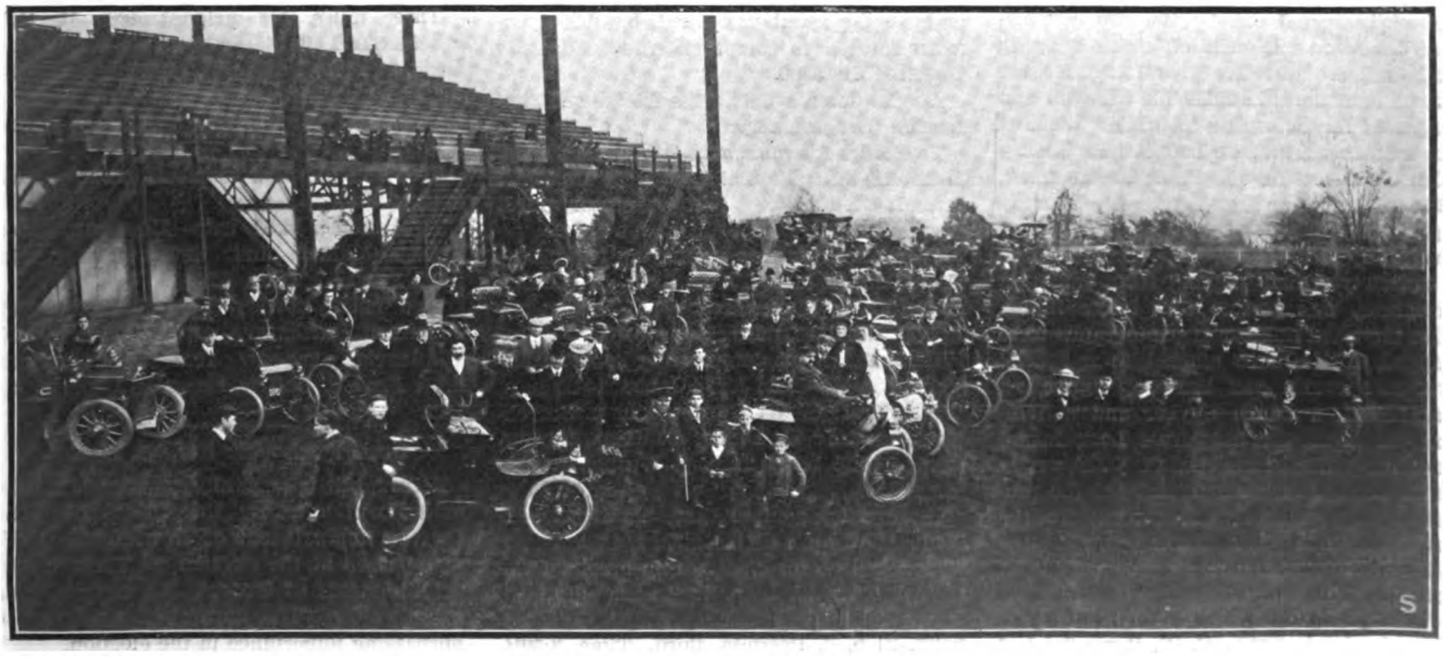
How Oldsmobilists Celebrated Election Day.



THE START FROM NEW YORK.

When General C. T. Cutting, who recently took over the Olds agency in New York City, hit upon the idea of a reunion of owners of Oldsmobiles and engaged the Empire City track for the occasion, he builded better than many knew. The outing took place on Election Day afternoon and nearly seventy runabouts and half a dozen touring cars made the start from Broadway and 53d street. After the uneventful journey up Fifth, Seventh and Jerome avenues to the Empire track, the participants sat down to luncheon in the club house. Following luncheon, General Cutting made a brief address of welcome in which he explained that it was just five years since the advent of the first Oldsmobile into the city. Roy D. Chapin, sales manager of the Olds Motor Works, also made a few remarks. In the drawing for the 1906 Olds runabout James Durand of No. 210 West 109th street, picked No. 56, which was the last to be drawn from the box, and won the prize.

Several races furnished sport for the remainder of the afternoon, all of them of course for Olds owners. H. B. Hutchinson, of Hempstead, L. I., won the one mile vent for runabouts in easy fashion from Freeman Munroe. F. Holbrook followed. Time, 2:00. In the event for touring cars, at the same distance, F. Iverson Taylor finished first in 2:40 3-5. C. E. Ross and J. E. Mitchell finished first and second in the half-mile affair and Mitchell crossed the tape first in the two mile. Time, 5:06 2-5. N. S. Seeley won the quarter-mile backward and F. Holbrook showed to the front in the gymkhana at one mile.

Mrs. Joan Newton Cuneo, of Richmond Hills, Staten Island, was allowed to drive an exhibition in her stripped White steam car. On the first trial she completed the circuit in 1:20 3-5 and asked permission to make a second attempt. The next trial was better, 1:15 being the time.

THE GATHERING AT EMPIRE CITY TRACK.

QUAKERS SEE THE LADY

And One of Them Was Mean Enough to Beat Her—Other Features of the Meet.

There was enough excitement crowded into two hours last Saturday, 4th inst., at the famous old Point Breeze driving track at Philadelphia, Pa., to satisfy anybody looking for thrills. It was the occasion of the first race meet of the Philadelphia Automobile Racing Association, and there was something doing every minute. One man had his leg broken; one car went through the fence, and another machine caught fire just as it was starting an event; Montague Roberts broke the five-mile record—for that track—in his intended Vanderbilt Cup racer, and Mrs. Joan Newton Cuneo, of Richmond Hills, Long Island — whose press agent fondly styles her the "champion woman driver of the world," and whom the A. A. A., in defiance of good taste and everything else, permits to cavort on the track—won one race and was defeated in another.

The presence of Mrs. Cuneo, Roberts and Dixon, the Englishman, who is here exploiting a Dutch car, prevented the meet from having the semblance of a purely local affair and made it a banner day for the Quaker City's automobilists and some four thousand other spectators, who flocked to the one-mile oval. When the first event was called it was estimated that over four hundred automobiles were parked in the inclosure—in fact, probably the greatest number that has ever gathered on one occasion in Philadelphia.

Featuring as the chief event of the day, or the one in which the fastest time was clocked, was the five-mile exhibition of Montague Roberts, who drove the 60 horsepower Thomas car which qualified for a position on the American Vanderbilt Cup team, but was airily tossed out by the cup commission. Roberts was sent off from a flying start, and the watches gave 1:02¾ for the first mile; Roberts handled his car well and completed the five miles in 5:14¾. When it was announced that he had beaten Barney Oldfield's record for the Point Breeze track, 5:28 3-5, the young New-Yorker was roundly applauded.

Naturally Mrs. Cuneo came in for a share of notoriety which, judging from past performances, was just to that lady's liking. After the usual number of photographs were snapped, Mrs. Cuneo started in a special three-mile event, and lined up against a Searchmont, a Dutch Spyker and a Winton. As usual, the lady from Long Island drove her White steam car. C. W. Rowe, in the 24 horsepower Searchmont, led the procession until rounding the stretch for the first mile, when Mrs. Cuneo came to the front. After that the race developed into a runaway, with the "driverine" miles ahead. To be explicit, the White crossed the tape a third of a lap in front. C. W. Rowe finished second. Time, 4:08. She subsequently competed in another special event of two miles against a 35 horsepower Apperson, driven by Philip Kirk, but Mr. Kirk was too ungallant to allow her to win. Mrs. Cuneo also started in a five-mile free-for-all, but was "obliged" to withdraw.

Max La Roche had a narrow escape when he plunged over the western bank of the track and through a board fence. Luckily neither the driver nor the car was injured. The accident happened in a three-mile event. The Studebaker car, with La Roche at the wheel, finished third, although disqualified for fouling. He thought he still had another mile to go, and was making a desperate effort to pass the winner, who was slowing up on the western side of the track, when attempting to negotiate the curve at full speed, the car skidded, and before it could be stopped plunged through the fence and disappeared over the embankment.

Spectators and officials rushed to the scene and found La Roche sitting in his car at the bottom of the gulley, with the wreckage of the fence strewn around him. He was badly frightened, but unhurt. Willing hands soon pulled his car out of the mud and water in the ditch, and the driver made a circuit of the track to show that he was unhurt.

Had the course been patrolled as it should the other accident would not have occurred. At the finish of the special race for Elmore cars a crowd of several hundred persons who had surged through the guidons separated to let the winner, M. J. Swain, pass through into the paddock. John Danill, one of the spectators, missed his calculations and was knocked down by the moving car. He was sent to a nearby hospital with a broken leg.

The special race for a purse of $1,000 between Harry Edwards's 16 horsepower Reo and C. W. Sprague's 22 horsepower Buick was not run because a connecting rod in the Reo broke earlier in the afternoon. Edwards asked to be allowed to substitute another car or have the event postponed, but his opponent refused to compromise, so Edwards forfeited the $500.

All the other events were fairly well contested. The summary:

Two miles for runabouts—W. David, 8 h. p. Maxwell, first; F. Smith, 8 h. p. Maxwell, second; Dr. Ferguson, 8 h. p. Autocar, third. Time, 4:26¾.

Two miles, for cars costing up to $1,500—E. Wilkie, 22 h. p. Buick, first; A. C. Harmar, 16 h. p. Elmore, second; C. B. Cleaver, 18 h. p. Rambler, third. Time, 3:10.

Three miles, for cars costing between $1,-50 and $2,500—Mrs. J. N. Cuneo. 45-20 h. p. White, first; C. W. Rowe, 24 h. p. Searchmont, second; E. Dixon, 20 h. p. Spyker, third; Philip Kirk, 24 h. p. Winton, fourth. Time, 4:08.

Three miles against time, motorcycle—H. Witham, 4 h. p. Witham. Time, 4:32.

Three miles, for cars costing over $2,500—Philip Kirk, 35 h. p. Apperson, first; S. Dixon, 20 h. p. Spyker, second; F. Wostenholm, 24 h. p. Peerless, third. Time, 3:59½.

Max La Roche (Studebaker), disqualified.

Five-mile match between Harry Edwards, 16 h. p. Reo, and C. W. Sprague, 22 h. p. Buick, for purse of $1,000—Walkover for Sprague. Time, 7:37.

Two miles for 18 h. p. Rambler cars—P. B. Huyette, first; L. C. Vogel, second; Thomas Roberts, third. Time, 3:34½.

Five-mile exhibition—Montague Roberts, 60 h. p. Thomas. Time by miles, 1:02¾, 2:06, 3:08¼, 4:11¾, 5:14¾.

Two miles for 16 h. p. Maxwell cars—Charles Hinze, first; W. Longstreth, second. Time, 3:35.

Two miles for 16 h. p. Elmore cars—T. Swain, first; A. C. Harmer, second; H. P. Stoey, third. Time, 3:48½.

Five miles, free-for-all—Montague Roberts, 60 h. p. Thomas, first; Philip Kirk, 35 h. p. Apperson, second. Time, 6:11¼.

Three miles, special—Philip Kirk, 35 h. p. Apperson, first; Mrs. J. N. Cuneo, 15 h. p. White, second. Time, 3:53.

Freeport has a "Ladies Race," too.

Probably three hundred people witnessed the first automobile race meet ever held at Freeport, Ill., on Friday last, 3d inst. According to advices from the Western town some of the spectators enjoyed the sport, while others considered them "beastly dull," and this despite the fact that a "ladies' race" was on the programme. This is probably because most of the competing cars came from Rockford, a neighboring rival. The summaries show that no records were broken:

Three miles—Fred S. Cutler (Knox), first; James Rogers (Premier), second; R. Savage (Rambler), third. Time, 6.53.

Two miles, for ladies—Miss Levings (Rambler), first; Mrs. Cole ("Frightened Rabbit"), second. Time, 4:18¾.

Three miles—Murray Carpenter (Rambler), first; D. Rogers (Knox), second. Time, 7:52½.

Three miles, for stripped cars—B. Cole ("Frightened Rabbit"), first; F. S. Cuttler (Knox), second; J. W. Miller (Maxwell), third; Harry Shoemaker (Cadillac), fourth; James Rogers (Premier), fifth. Time, 5:13½.

Free for all slow race—Alderman Brokhausen first.

Two miles, local cars—Alderman Brokhausen (Moline), first; Erwin Hoefer (Moline), second. Time, 4:52½.

Two miles, novelty—Fred Jastram, first; Alderman Brokhausen, second. Time, 10:35.

Balancing see-saw feat—Fred Jastram, first; Fred S. Cuttler, second. Time no object.

Good Roads Vote Not yet Known.

Although it is generally supposed that the amendment creating the $50,000,000 fund for the improvement of New York's roads was passed at the election on Tuesday, the definite result of the vote has not yet been made public. The matter of men was of surpassing importance in the election.

YOU'RE NOT "IT," SAYS PARIS

Newspaper Juggling with Figures Stirs France and England—British Bid for Panhard Plant?

Paris, Oct. 24.—The publication of an article by a well known Paris journalist, proving by figures that are manifestly false that England is the world's biggest market for automobiles, and should therefore be assiduously cultivated by the French trade, has awakened quite a sensation in that country. The British Empire Motor Trades' Alliance has reprinted the article, which has had the honor of republication in the different journals, and the statements have been so widely disseminated that the Britishers have easily convinced themselves that they are the biggest consumers of motor cars in the world and are in a fair way of supplying their own needs.

This comfortable assurance would have been modified somewhat had the British Empire Motor Trades' Alliance taken the trouble to analyze the figures and stick to facts, when they would have seen that there has been a hopeless muddle of returns for seven months and a year. The facts are sufficiently satisfactory as showing that the British trade is steadily growing, and there was no necessity to inflate them for the purpose of a boom. The British trade has long shown an inclination to present matters in the most glowing light, in the hope that the public will accept this evidence of business prosperity as proof of the superiority of British vehicles, and while this policy may be justified in a certain measure, there is always a danger of its being overdone. It is so in the present case. The Frenchman's figures have been analyzed and found wanting and the bubble has been pricked. Nevertheless, more have read the original article and the editorial comments thereon than the subsequent criticisms, so that there is still a very large proportion of the population in the British Isles who believe that Britain stands first as a motor manufacturing and motor using country.

So far as concerns the business being done in motor cars, England certainly takes a leading position, and it is easy to understand that home manufacturers should be looking with some jealousy to the enormous and growing importation of foreign vehicles and should be doing everything in their power to divert the public demand from foreign to British cars. If they could monopolize the business the home manufacturing industry would be in a state of unexampled prosperity. This monopoly is worth striving for and it is occupying the undivided attention of the whole trade, which is doing everything in its power to create a popular preference for the home made article. For a long while they harped on the patriotic string with no very tangible result, for the motor car is not one of those things that you can label with a party ticket except at the elections, and finding that the British will buy the best in the cheapest market, they are trying to show that there is nothing to touch the British car on the score of quality and price. It was with the idea of pushing the home vehicles right to the front and keeping the foreign productions in the background that the trade has been juggling with the show dates and holding the Olympia show three weeks before the Paris Salon, so as to take the bloom off the French show, but I do not think that the Paris event will suffer in the slightest way from this competition, notwithstanding the undoubted success of the Olympia gathering. London can never become the motor mart of the Continent.

While the Britishers are proclaiming the superiority of their own cars, it is a little curious to see how anxious they are to get control of good business propositions in France. There are several motor companies in this country which have been bought up by English capital and are now purely English concerns, and at least two have been added to the list during the past few weeks, one of them a manufacturer of heavy vehicles, and the other a small firm who have specialized themselves in low priced cars. Now it is rumored that negotiations are in progress for the purchase of the Panhard & Levassor business by a British syndicate. The price is stated to be $10,000,000. I have been unable to ascertain whether this statement is true, but no official denial has been forthcoming. If such an offer were made a few years ago Panhard & Levassor would certainly have refused it, but since that time there have been many changes in the automobile industry with the coming into existence of a dozen firms who are turning out vehicles with as good a reputation as the Panhard, and I doubt if the firm could refuse such an offer if it were made now. As to whether it be equally good business for the buying syndicate is another matter, and it would doubtless require a lot to convince the public that Panhards are worth such a huge capitalization. They have swallowed a lot in the past—but $10,000,000!

Dinsmore Succumbs to Pneumonia.

Clarence Gray Dinsmore, one of the most widely known motorists in the world, succumbed yesterday in the Waldorf-Astoria, in New York, to an attack of pneumonia. Although a New Yorker by birth, he had spent the greater part of his time abroad, particularly during the last eighteen years, when he had divided his time between Paris and the Riviera. An enthusiastic lover of the sport, and himself a noted driver, he was one of the charter members of the Automobile Club of America, and had served as its foreign representative. A year ago he was elected its third vice-president, and was assigned to its Committee on Foreign Relations. Besides his American affiliations, Mr. Dinsmore had done much to promote the German branch of the industry, having entered his car repeatedly in the Bennett and Vanderbilt events as a member of the German team. Mr. Dinsmore was 59 years of age.

IN FAVOR OF CHAINS

One of Their Advocates Takes Issue With Shaft Drive Partisans and Outlines Advantages.

"Although a French car equipped with a shaft drive won the Vanderbilt Cup, it might be stated that the Italian car made by far the most wonderful exhibition in the cup race—equipped with a double chain drive," remarked a Whitney chain man the other day when that moot point was under discussion. "But this probably would prove nothing in favor of the chain transmission, as the skilful and fearless Lancia would undoubtedly have made a similar record with a gear driven machine if the parts were in good proportion and backed up by a sufficient amount of power. Both the chain and bevel gear methods of transmission have given our manufacturers and users a lot of trouble, but step by step the difficulties have been eliminated until both styles have made records we may well be proud of.

"I have been told that a certain American racing car which the makers wished to enter in the cup race was found before the elimination trials to be considerably overweight, but they brought the same to a point well under the stipulated weight by abandoning the gear drive and replacing it with the double chain. If this is true, it would indicate that the double chain transmission gives greater strength with less weight, and this point should not be passed unnoticed.

"A number of years ago our automobile manufacturers equipped their steam cars with bicycle chains, and then added extra seats for more passengers without increasing the size of the chain. This gave the chain drive a "black eye" from the very start, but, notwithstanding the fact, I believe about 80 per cent of the cars are chain driven at the present date.

"The chain and sprockets used on most all the earlier model gasolene cars were not correct and suitable for the purpose, and most of the chains were damaged by interference, as but few manufacturers allowed sufficient space for chain clearance. When it was found that chains were not right for the severe duty it was in most cases impossible to remedy the difficulty by supplying larger or heavier chains on account of the limited space provided. When the gear drive was presented it was welcomed by many who had been annoyed with chain troubles, but later on they were equally disgusted with bevel gear troubles and difficulties with universal joints, thrust collars, weak rear axles, limited power, etc. Certain manufacturers made their own sprockets, and evidently assumed it was necessary only to mill in the same the correct number of teeth. If the sprocket were not the right width, not cut to the correct bottom diameter, teeth too straight on sides and irregularly spaced, sprockets out of line, etc., it was supposed to make but little difference.

"When some of the same manufacturers

Digitized by Google

commenced to experiment with the gear drive they were obliged to purchase their gears from manufacturers who were expert in this line, and it was necessary to pay a high price for the quality and accuracy required to insure the gears revolving. If bevel gears were cut in the manner some sprockets have been cut the results would be astonishing.

"I believe both the shaft and chain drive at present on many cars are a success, but imagine the chain will be by far more popular in the future for the following reasons: Less weight, less friction, lower cost to manufacture, lower cost to repair, less time to repair.

"Ease of changing gear ratios to suit road conditions for various parts of the country.

"Saving on tires by less weight.

"More reliable rear axles for rough roads and heavy loads.

"In case of an accident the chain driven car may be pushed off a railroad track or from the centre of a road."

Checking the Price Cutter.

That at least one British manufacturer of small parts is in no mood to tolerate promiscuous cutting down of the listed price of his goods, and that he intends to deal in a summary and effective manner with any retailer who for the sake of a few sales in a single line, and the consequent advertisement to his business, is willing to disregard the listed price of the goods and dispose of them at slaughter house rates, is shown by the following communication which he dispatched to a house which has risen to a position of no little importance through the medium of this very practice:

"Our attention has been called to the fact that on page — of your motor catalogue you are listing our sparking plugs at rates that do not admit of proper profit to yourselves or anybody else. A plug which costs you 1s. 6d. you are listing at 1s. 7d.

"On page — you are listing our lubricating oil at cut rates; we have therefore given instructions to our staff that from this date they are on no account to supply you with any goods whatsoever, either for cash or for account, and anybody supplying goods will be subject to instant dismissal. This rule will remain in force until such time as your present prices for our goods are withdrawn and the proper prices, if any, are inserted. In addition, we must ask you please to immediately return us the electro of our —— plug, which is our property and which was not lent you with the idea of your ruining our trade in these plugs. Unless we receive this electro within seven days from date we will take legal proceedings for recovery."

Grease for the Wheels.

It is quite essential to the smooth running of the car that the hub caps be filled with grease at not infrequent intervals, so that a plentiful supply of lubricant for the wheels is assured. In cars which are fitted with ball bearings this, of course, is not necessary, but it is none the less essential that the bearings be given their proper incentive to good working.

REGARDING THE RANIER

Features of a Car that is Sold with a Most Unusual Guarantee.

When in the spring of the current year the Rainier Company, of New York, which up to that time had been closely identified with the electric vehicle business and whose heavy commercial types of machine already had gained considerable distinction, brought out the first Rainier gasolene car, it was not, and indeed is not now, generally known that the move meant that they would no longer have to do with electrics. This is the case, however, as also is the fact that the car at once gained the attention of the market not alone on account of its neat and pleasing construction, but also on account of the novel guarantee which accompanied each car sold. This guarantee, which was in effect an absolute agreement on the part of the makers to replace any part of the chassis which failed through any reason whatsoever, barring accident, within one year from date of delivery, proved a taking advertisement. So successful was the venture in every respect that the intelligence was given out early in the fall that from that time forth the firm would abandon the electric vehicle field and devote itself wholly to the production of gasolene machines.

Following close upon the heels of this announcement come the details of the second type of Rainier, marked "Model B." Constructed upon the same general lines as its predecessor, this car is essentially a betterment of it, and at once a more powerful and up-to-date type. It is characterized by the following features: In the engine, four cylinders, 30 to 35 horsepower, make and break ignition, interchangeable valves; transmission, three-speed shaft drive; frame, pressed steel, enclosed underneath; wheel base, 104 inches. The body is constructed entirely of aluminum, with liberal side entrances, the tonneau being large enough to permit of the addition of a couple of extra seats if necessary. There is ample locker room under the rear seat.

In the ignition system all the vital parts, including the advancing mechanism, are located at the tops of the cylinders and are readily removable or replaceable in case of derangement. The time shaft is driven independently of the cam shafts, by means of enlosed steel gears running in an oil bath, The Simms-Bosch, low tension magneto is carried on a boss of the engine base, and is entirely enclosed. The cam shafts are of case hardened steel with cams made integral with them, and are driven by enclosed bronze gears. Water circulation is accomplished by means of a positively actuated centrifugal pump, and the radiator fan, instead of being mounted on the radiator, is carried on a bracket affixed to the front cylinder.

The main bearings of the engine are fastened to the upper half of the case, so that the base may be removed without disturbing their adjustment. The arrangement of the motor is such that it can be removed from the chassis without being in any way dismantled, the exhaust and inlet piping and the cooling system being the only connections which it is necessary to break in order to dismount it.

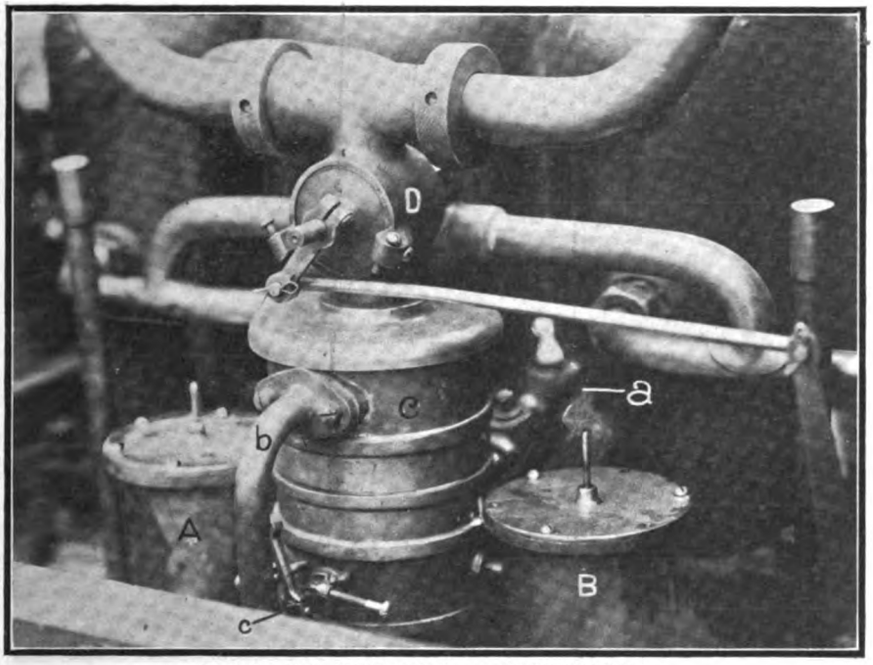
The transmission system is of the ordinary type, the clutch being of the leather-faced cone variety, with a universal joint interposed between it and the gear case. The latter contains the usual essentials, the changes being accomplished by the movement of a single sliding member, which is forged on one piece. The gears, which are of 50-carbon steel, are bolted to flanges which are integral with the shafts. The case is aluminum.

The propeller shaft is also constructed of 50-carbon steel, with oil-hardened forks at the joints, and case-hardened pins. The rear axle construction embodies the excellent feature of having the load supported entirely upon the axle tube, while the driving shafts are simply called upon to transmit the driving effort and are free from all other stresses. The wheels are mounted on ball bearings, and the construction is such that the driving shafts may be removed entirely without disturbing the wheels or removing them from the car. The differential gearing is also mounted on ball bearings.

The front axle is of I-beam section, of drop forged nickel steel structure, and is equipped with reversed Elliott steering knuckles, fitted with ball bearings. The frame is of cold rolled pressed steel. The wheels are 34 inches in diameter, taking 4-inch tires. The braking equipment consists of a pair of internally expanding shoes on the rear wheels actuated by an emergency lever and a foot brake acting on the propeller shaft. All braking surfaces are arranged with phosphor bronze against steel, and all are double acting.

When the New Model is Nearly Ripe.

Sometimes the manufacturer who would have his forthcoming model granted a measure of advance publicity, and who is unwilling to give out full details, finds himself in rather a peculiar position when he sees the effect of his "hand outs" on the trade press. Thus a foreign print, which has been the recipient of one of those vague and startling disclosures which fail to disclose much of anything except the unbounded faith of the maker—in himself:



"We hear of a new Blank landaulet. There is quite an air of mystery about it. From what we can gather it has no chains—in fact, no gear at all worth mentioning. Its engine can neither be seen, felt, smelled nor heard, and it takes up very little more room than a cab without a horse, and will turn in the width of a narrow street. Just how it does all these things we are not at liberty to mention at present, but we hope in a week or two to say something a little less vague. There is even a rumor to the effect that there is a prize to be given to the first man who finds the engine, but we give no credence to it."

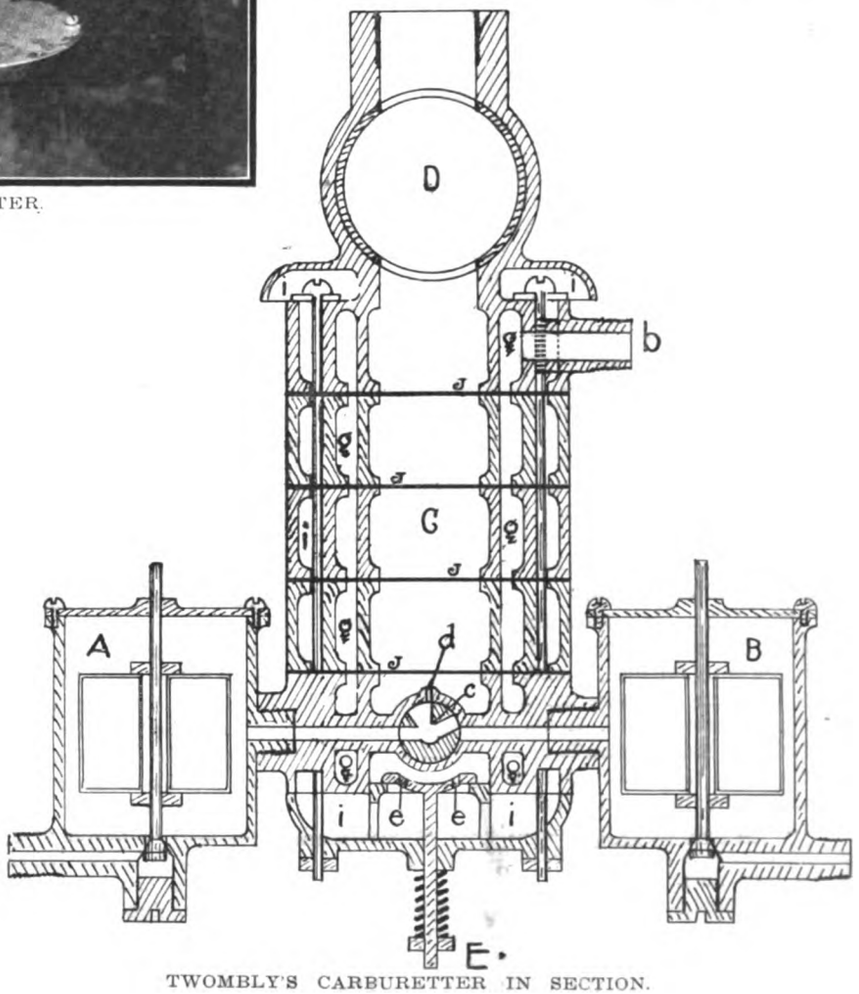
KEROSENE IS FUEL

Twombly Devises a Carburetter that Renders it Possible—Also has Novel Shock Absorber.

Probably the two most important problems which face the motor car designer of the day, if he be desirous of keeping at the head of the march of progress, are those of suspension and the carburetion of heavy oils. Of these two problems the first is occupying the attention of many a "professional inventor," as well as those who are working in the interests of a single line of machines, and, though many strange results are being brought forth, not a few of which promise much toward the future emancipation of the automobile from the pneumatic tire, still the universal adoption of the solid tire used in conjunction with some improved type of suspension is yet to be accomplished. Similarly, although there are not a few carburetters which have been designed to vaporize the heavier oils and carburate them for the uses of the gas engine, the truly practical type has yet to be produced in commercial form.



TWOMBLY'S KEROSENE CARBURETTER.

A machine which embodies among others the two novel features of a kerosene oil carburetters and a form of suspension which permits of the elimination of pneumatic tires in favor of the ordinary type of solid tires such as are commonly installed in the lighter forms of slow going commercial vehicles, is the Twombly car, manufactured by the Twombly Power Company, of New York City. This interesting machine, which is of the 25-30 horsepower order and otherwise perfectly "regular" in design, recently demonstrated to the perfect satisfaction of a Motor World man the somewhat startling claims of its designer, that he had produced a car which would run perfectly well using kerosene fuel, meeting the give and take conditions of city traffic with no more effort than would be shown by a machine of the ordinary type, and running on solid rubber tires, with as little vibration as would be experienced with pneumatics under the same conditions.

In the adaptation of the carburetter to the ordinary motor designed for the lighter oils it has been found expedient to use gasolene for starting purposes, since although it is possible to put the motor into action using the heavier oil alone, the use of the heavy vapor in a cold motor tends to form deposits upon the walls of the inlet passages, which clog them in the course of time. So that on this account and for the sake of convenience in starting without delay and loss of power before the carburetter has become heated to its normal temperature, a double fuel supply is carried, and the carburetter is provided with two float chambers, the one for gasolene and the other for kerosene. Once the machine has become heated, however, and the fuel supply has been shifted over to the heavy oil side, there is no further need for the gasolene until after it has been allowed to cool off again.

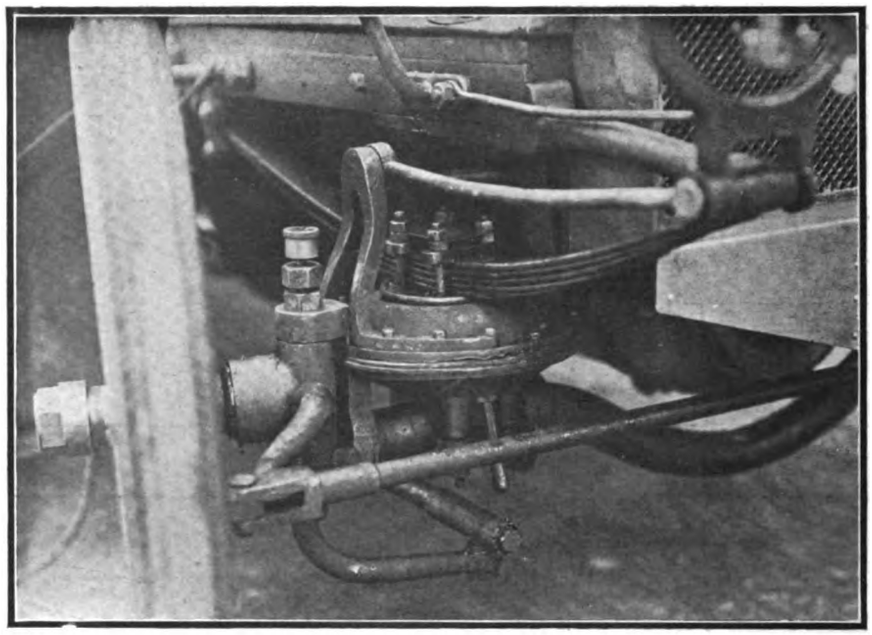
The use of kerosene or any of the other heavier oils involves no new principle in the matter of vaporization and carburation. The kerosene carburetter contains the same essential elements as that for gasolene, except that as the boiling point of the liquid is considerable higher than that of gasolene, it is necessary to heat it to a considerable degree in order to effect the breaking up of the vapor and its complete admixture with the air. This is effected in the Twombly carburetter by three several means—that is to say, by the heating of the oil, the heating of the incoming air and the subsequent heating of the mixture, all of which is accomplished by the use of a portion of the exhaust.

TWOMBLY'S CARBURETTER IN SECTION.

The precise method in which this is accomplished and the general arrangement of the

Digitized by Google

device is here illustrated in exterior and sectional detail. The two float chambers, A and B, are placed diametrically opposite one another. in line with the car. They are precisely alike, having upwardly closing needle valves and feed into a common pipe, which is closed by a three-way cock, C, directly beneath the jet, D. The third opening in this valve, which gives to the jet, is wider than either of the others, and is so proportioned that when the valve is in an intermediate position the fuel is supplied from both sides, thus permitting the temporary use of a combination of the two fuels, and providing against a momentary loss of power in the motor while changing over from one to the other. This valve has also another special feature in that it is tapered like an ordinary stop cock, and is held against its seat by the action of a spring, by which means it is rendered self-grinding and bears against its seat with a constant tension.



The space within the mixing chamber is similar to that in any carburetter, except that it is much longer and is intersected by a series of four brass wire screens of very fine mesh. Above these the throttle valve, D, controls the inlet to the engine in the usual manner. A double jacket surrounds the mixing chamber, that next the chamber containing the hot gasses which are used for heating, and the outer one containing the incoming air. This, entering by way of the annular opening, I, which surrounds the device at the top, goes down to the bottom, on its way passing through a series of four restricted openings which are covered by the gauze screens, and finally reaching the chamber of the base, whence they are drawn up through the valve, E, to the mixing chamber.

The valve, E, which is similar in action to the supplementary inlet common to most carburetters of current design, is perforated by four small holes, e, which are of sufficient area to give the proper mixture for the engine when running with the throttle nearly closed. For any greater speed the increased suction causes the valve itself to lift against the tension of the spring mounted on the lower end of its stem. The regulation of the tension of this spring controls the proportion of the mixture.

The hot gases which are taken directly from the exhaust pipe are led into the carburetter by the pipe, a, and, passing upwardly through the wire screens, is exhausted through the pipe, b. In its passage it heats both the inclosing walls of its jacket and at the same time heats the wire gauze which, completely intersecting both the air inlet and mixing chambers, serves at once to break up the gases as they are drawn through and to heat them.

In practice the chamber, A, which contains the kerosene feed, is used continuously, the three-way valve, c, being turned to the position shown in the sectional view. The efficiency of the exhaust jacket is so great that the gas is completely broken up and mixed, the temperature of the inlet commonly running as high as 200 degrees F., and hence there is absolutely no trouble from irregular firing once the right proportion of gas and air has been determined.

In the Twombly Pneumatic Shock Absorber the pneumatic tire is simply taken from the wheel and placed on the axle beneath the spring. The device in actual practice is as simple as the principle upon which it acts, for it is nothing more nor less than a resilient pneumatic cushion of a construction identical with that of an ordinary tire, inflated in the ordinary manner and carrying its load in the same way as a tire, and with the same effect.

TWOMBLY'S SHOCK ABSORBER.

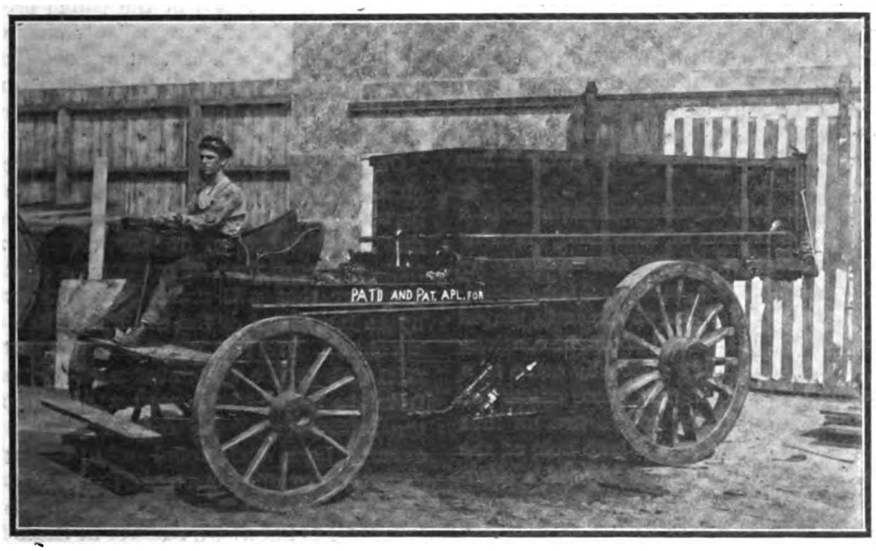
As will be seen from the illustration, it consists of a circular cushion, 10 inches in diameter, having a convex gun metal base, bolted to the axle by means of clips such as are used for holding the springs in place ordinarily. The upper half of the cushion, which alone is flexible, consists of a compound fabric composed of a layer of rubber, a layer of woven fabric, a second layer of rubber, and over all a layer of pigskin which serves as a protection for the other layers. A couple of circular bronze plates placed at the centre of the cushion, one within and one without, serve as a bed for the spring, which is bolted to it by means of the usual lugs. An inflating tube with an ordinary tire valve is placed in the lower section, and serves for the occasional inflations of the cushion which are necessary.

The fabric is held at the joint with the metallic base by means of a bull ring bolted down. To this is also bolted a vertical arm in the case of the front cushion, to which is affixed a torsion rod coupled to the front spring dummy. This serves to guard against any possible serging action on the part of the cushions due to side thrusts in taking corners, and to keep the spring supports in the centre of the cushion. No such provision has been found to be necessary in the rear.

The car, which weighs about 1,600 pounds, is mounted on semi-elliptic springs of the common type, those in front being thirty-two inches long and having five leaves, while those in the rear are thirty-eight inches long and have seven leaves. The wheels, which are thirty inches in diameter, are shod with 3½-inch semi-solid clincher tires, which serve to ease the wheels and axles from the road shocks and to aid in the cushioning of the whole car. The general effect of the suspension is sensibly the same as that obtained from the ordinary pneumatic tire arrangement, and the unique system promises to open up an entirely new field in the matter of car mounting.

Tires Did Not Give Trouble.

Although most people had practically forgotten all about it, the Diamond Rubber Co. has been industriously running to earth the report that in the Vanderbilt cup race the Christie car had burst a tire. As it was the first time that car had employed Diamond tires and as owing to its odd construction it had the reputation of being a "terror" on tires, the Diamond people were unusually concerned. They made extended inquiry and failed to find any trace of tire trouble, a state of affairs borne out by Mr. Christie himself. In his statement he not only says that he had "no tire trouble whatever," but that if it had not been for the breaking of a connecting rod the night before the race, "you would have seen the tires making some fast time on my car."



A firm which is making several large motors for gasolene railway cars has revived the practice of starting them by means of a powder discharge. In the present instance, cordite cartridges are used, three out of six cylinders being fitted with removable igniters, in the place of which are substituted the cartridges which are removed after the other cylinders have commenced to fire regularly.

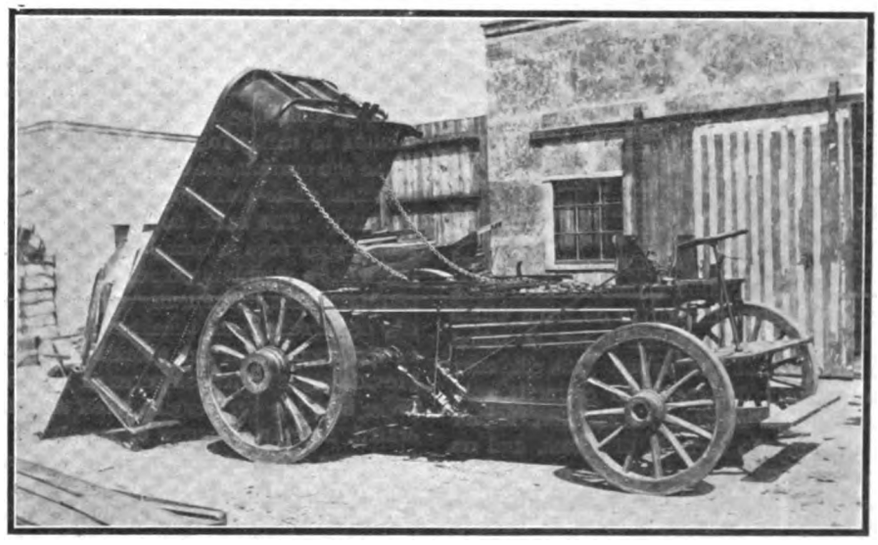
WOOD'S NEW MOTIVE POWER

He Holds It Close but Produces Impressive Figures Showing Its Capacity for Heavy Work.

Having long ago convinced himself that neither steam nor gasolene was suited to the best propulsion of heavy road vehicles conveying heavy loads, J. C. Wood, of No. 784 Madison street, Brooklyn, N. Y., has evolved what he styles a new power, but for which he has not yet selected a name. It has required seven long years of experimentation and labor to perfect it, but Wood believes it is now right, and that the world will hear much more of it. He has applied it to two heavy trucks, and the results have been such as to meet his fondest hopes. Because of certain patent protection he is seeking he is not ready to lay bare the secret of the new power, which is smokeless, noiseless and odorless.



WOOD'S 150 HORSEPOWER TRUCK .

While neither steam nor gasolene, the inventor describes it as "embodying elements of both"; it has "the flexibility and distort of steam, but does not require a transmission gear or clutch and is easily controlled by the throttle."

Coal and a mixture of oil and water constitute the fuel and motive power, and applied to a truck experimentally used in hauling coal in New York for several months it carried from 10,000 to 12,000 pounds at an average of six miles an hour at a cost of 80 cents a day. The truck shown by the accompanying illustration is Wood's latest creation, and has been employed in hauling asphalt and paving stones. Carrying 14,000 pounds of the former, it has climbed an 8 per cent grade, one and one-eighth miles long, in 13 minutes, and completed the round trip of the six mile route on which this hill is located in 68 minutes. The time for a horse drawn truck over the same route with half the load is two and one-quarter hours.

Carrying 350 paving granite stones, the truck has climbed an 8 per cent hill two blocks long, and has attained a speed of ten miles an hour. Hauling the same load, it has been propelled through four inches of fresh sand spread on the earth, turned around in the sand, dumped its load and then with only an eight-inch piece of timber as a bridge has mounted a rise of fourteen inches necessary to reach the paved portion of the street.

The power of the truck is estimated at 150 horsepower—it is actual horsepower, too, the inventor asserts. The tires are of steel, six inches wide.

WOOD'S TRUCK SHOWING METHOD OF UNLOADING.

Minister Beaupre, at Buenos Ayres, in his report to the Consular Department, states that a service of automobile cabs has just begun operations in that city. The cabs are all supplied with taxometres, and the fare is 21½ cents for the first 1,000 metres (3,280 feet), and 4½ cents for every 300 metres (984 feet) thereafter. Minister Beaupre believes that Argentina offers a good field for electric vehicles.

CLUTCH TENDENCIES

The Varied Efforts to Devise a Satisfactory Article and the One Definite Achievement.

From what has been done in the past nine months, or since makers generally revealed the secrets of their present year models at the shows, it is not a difficult matter to divine what some of the detailed features of next year's cars will be, and distinction in detail will of course be practically the only distinguishing feature of cars of the same price henceforth. It is not too much to say that by close observation of the general trend of affairs, coupled with a little personal experience and a judicious sounding of the views of others in a position to know whereof they speak, it is not necessary to know what is going on behind closed doors in the draughting rooms and laboratories of the factories to make some prognostications that will in the fullness of time prove to be more than generally correct.

Take the detail of clutches, for instance, and it must be admitted that it is rather an important detail at that, judging from its frequent treatment by the technical press. A very large part of the contributions are composed of symposiums on the gentle art of clutch manipulation. "How to use the clutch." Likewise just "How not to use the clutch." "How to reface a worn clutch." "What to do when the clutch suddenly and unexpectedly binds." All these of course refer to the most common type—the leather-faced variety of cone clutch, and by the same token most of them devote more or less time to the shortcomings of that same piece of mechanism. That the passing of this particular form of clutch is a certainty can be stated without fear of diverging from the truth, but that next year's shows will not mark its demise is equally true.

It is of considerable interest to glance back

Digitized by Google

upon what the greater part of 1905 has brought forth in this respect, and from this retrospection can readily be determined just why the cone clutch will be a factor next year, though in considerably diminished numbers and sans leather in many more instances than otherwise. To take them up in the order of their importance, omitting any detailed reference to the host of experimental devices that have come and gone in that interval, it is probably well to give the prominence it deserves to the subject of the metal to metal clutch regardless of type. It is in this direction that the greatest amount of progress away from the old leather-faced cone is evident. First and foremost naturally comes the multiple disc. The principle of the device, which is the same in all cases despite the differing forms of its application, is too familiar to require comment or explanation, and it is further well known among those who have studied the subject that to take advantage of it requires a mechanism of considerable complicatioif that must at once be capable of delicate adjustment and positive operation through its comparatively short range at action. Its greater first cost is directly proportionate to its added complication and it surpasses the simple cone about equally in both respects. Yet there exists the seeming anomaly of some of the highest priced and some of the most inexpensive cars on the market figuring it as a standard part of their equipment. In both extremes it appears to have been productive of equally satisfactory results, and these are some of the instances in which a return to the leather-faced cone is a very remote possibility.

While it is, of course, subject to derangement, what mechanism, however perfect and simple, is not? Its ills differ with its nature and are in consequence not those to which its predecessor is subject. There is no facing to strip off, no binding, or, rather, jamming, as of the cone into the flywheel, to guard against, as the friction generated between a number of plates running in oil from which the latter must be squeezed out is relied upon to transmit the power. Its efficiency when properly designed and correctly constructed is, if anything, somewhat higher than that of the form it displaces, and on the whole its general behavior in experienced hands is such as to not only warrent its continuance by the makers who have already adopted it, but will doubtless insure for it new adherents. The fact that certain combinations of circumstances that cannot be foreseen nor guarded against will occur at times to derange it is not an argument against it, though the fact that repairs, when necessary, are of a more complicated and expensive nature, as well as its greater initial cost, will make it slower of adoption than did these drawbacks not exist.

But it has been conclusively shown that it is not absolutely necessary to resort to an aggregation of metal surfaces in order to obtain the holding effect requisite to prevent an undue loss of power, and in the evolution of a plain metal to metal clutch, not making any great departure in design from its leather-faced forerunner, the past season has been responsible for considerable development. Not that there has been a general adoption of this type, for the reverse is the case, but in those instances in which it has been employed the results have been such as to justify its continued use and to make its employment in increased number very profitable. There remains to be noticed the individual clutch, which also comes under this heading. For one reason or another its use has not been widespread, although builders who have adopted it as a standard part of their equipment have in most instances retained it without radical change through two or three seasons. But as compared with other systems the number thus using it has been very small.

In the numerous experiments made with a view to the evolution of something superior to the majority of forms now extant, by which must usually be understood the leather-faced cone, electricity has, as formerly, played a prominent part, and will no doubt continue to do so until inventors generally come to a realization of the fact that there exists the same serious drawback to its use as first made electrical ignition the bete noir of the builder. It has been shown beyond a shadow of a doubt that there is no inherent defect, either mechanical or electrical, that precludes the possibility of making use of the electro-magnetic clutch on the car, while that it is a form very much superior to some now in common use cannot be disputed. Numbers are in daily use in shops and factories where they have been found superior to older mechanical forms, the necessarily sudden starting and stopping of which proved detrimental to many forms of light machinery, while the current consumption is found to be so small as to form practically a negligible quantity. The same holds true of the current supply for ignition purposes on the car, but what a stumbling block it has proved to maintain that "practically negligible" quantity of current at all times need hardly be adverted upon. If it has proved so difficult to provide eight to ten amperes at six volts in order that the very engine itself may be operated, how is a source of supply of three times the output to be obtained without unduly overburdening the car with an electrical system? This is the shortcoming of both the electro-magnetic clutch and the speed change gear of the same nature that the numerous inventors working along this line have been blind to. Inability to provide adequate current and the danger of breakdown through its failure constitute at present an obstacle that renders further experiment in this direction unprofitable.

Recourse has been had to other forces in the attempt to evolve a positive acting clutch which would at the same time be susceptible to immediate and accurate control at the will of the operator, and of these hydraulic power has been the favorite. Several clutches of this kind have been produced, and while admirably simple and theoretically, at least, easy of maintenance and operation, it is not certain whether they form an advance over the simple friction cone. So far as is known none of them has progressed to a point where the confidence of a builder has been gained in their efficiency to an extent that warranted their adoption as a standard feature of his car's equipment.

Compressed air has likewise been experimented with, but strangely enough less has been done with it so far as regards its application to the solution of the clutch problem than any of the other expedients mentioned. This despite the fact that compression is most commonly resorted to on a large number of cars, both for the lubricating devices and the fuel supply.

On the whole, the multiple disc type of clutch apparently forms the one definite step forward that has been taken in this direction and its presence on at least several more makes of cars than at present boast it is a prophecy that will undoubtedly be verified by an inspection of the exhibits at the coming shows. The relative importance that this vital link in the transmission of the power from the motor to the road wheels bears to the remainder of the mechanism has frequently been underrated with consequent detriment to other parts of the car, chiefly the tires and change speed gears, although the motor is likewise a sufferer at times from the effects of improperly designed clutches. More often, however, the evil results are attributable to improper manipulation rather than to fault in the mechanism.

What has already been said on the subject of clutches has been particularly with reference to high powered cars upon which the use of a cone clutch of some form has usually been regarded as necessary, but it is noticeable that the widespread development of the light car has been responsible for a hitherto unthought of employment of the planetary type. Primarily this was regarded as only adapted for the transmission of small powers and its use was in consequence confined principally to the runabout. From the latter it was a natural step to the car which, though having not a great deal more power, was classed as a touring car, and from this its adoption in suitably enlarged form on cars having as high as 20 horsepower has followed. It provides smooth and easy running on the high gear which with a flexible engine can be used for practically everything but surmounting steep grades. Its use has accordingly become general, particularly with cars using the horizontal opposed motor, and as the latter has grown in size and power, the planetary gear has kept pace with it, so that it would not be surprising to note its use on cars of higher power next season than has ever before been deemed practicable.

In a French theatre recently, where a play was being shown in which a motor car played a more or less important role, a real gasolene machine was installed behind the scenes to furnish the required noise. Must have been quite a relief to an audience which had become used to the usual drum and sandpapered stick combination.

CARS FOR SOUTH AFRICA

Market is Favorable but Present Vehicles are Unsuitable—What the Country Requires.

"The motor car and the motor lorry are now established and indispensable factors in South Africa's commercial and industrial economy, but although six years have elapsed since the introduction of the first car, the supply of mechanically propelled vehicles perfectly suited to South Africa's requirements does not appear to have been realized," according to A. T. Hennessy, chairman of the Automobile Club of South Africa, "but the manufacture of such a car has never even yet been attempted by home, European or American manufacturers, owing apparently to the fact that the South African demand for these vehicles, great and growing as it is, is still insufficient to warrant departures from standard patterns."

Passing in review the leading types of cars, Mr. Hennessy dismisses the electric as possessing no claim as yet to adaptability to South African circumstances, and concentrates attention on steam and internal combustion motors.

The use of steam cars in South Africa was, it seems, prejudiced in the early days by the introduction of cheap, light American steam runabouts, badly designed, constructed of inferior material and roughly finished, and with fuel and water capacity not exceeding twenty-five miles. A much better car has, however, since been placed upon the market, in which the boiler is replaced by a steam generator which instantly flashes the water into steam, while the control of the fire, water and oil is automatic. Condensers are also fitted and the mechanism of the car has been simplified and strengthened. Nevertheless, according to Mr. Hennessy, the steam car still falls below South African requirements for the following reasons: Storage capacity for water and fuel is too small; the machinery occupies more space than that of a gasolene car, thus seriously reducing available room on the car; it is also more complicated than that of the gasolene car, and is more likely to get out of order, the pilot light especially giving trouble. Running costs are also greater than with an equal power gasolene car. In the steam car's favor are, however, its reserve of power, ability to use common gasolene, etc., which will, Mr. Hennessy allows, always insure it a considerable patronage with motorists acquainted with its merits.

Mr. Hennessy's comments on internal combustion motors relate solely to gasolene cars, and they are, like those on the steam cars, dictated solely from the standpoint of South African requirements. In the main, the defects alleged are less those of construction and material than of design. While the respective merits of low or high speed engines may remain a debatable point, experience favors the medium for South African conditions, as being more economical, giving less vibration and less wear on the wearing parts and bearings, combined with greater efficiency. In the matter of single or multiple cylinders, with a car over 6 brake horsepower the multiple cylinder gives the best results, being better balanced, producing less vibration, running quieter, yielding better hill climbing power and less wear of wearing parts. These offset the objections of complication of parts and duplication, as increased reliability and freedom from breakdown are insured. Separate cylinders, as offering larger cooling surfaces, so needful in a semi-tropical climate, are likewise preferable; while, on the other hand, mechanically operated inlet valves are inferior to the automatic, owing to difficulty in obtaining spares in the case of a breakdown. As to cooling arrangements, those of cars introduced to South Africa hitherto have, with but few exceptions, proved totally inadequate. Climate, steepness of hills, need for constantly pulling up to negotiate the innumerable sluice and streams that cross the country roads—all combine to overheat the engines; hence the need for fitting South African motors with larger water tanks, more efficient radiators, with larger fans and, in many cases, more powerful pumps, these last being gear driven in preference to either belt or friction driven.

According to Mr. Hennessy, the parts of motors which offer the greatest scope for improvement, so far as South African use is concerned, are those connected with the transmission and running gears. The clutch, in particular, should be made so as to operate very gradually, and if capable of sliding indefinitely without undue wear would add immensely to the life of the car and the comfort of the occupants. The cone shaped leather faced clutch, which is the one most general in South Africa, is held to be the most unsuitable that could be devised. On the other hand, the metal-to-metal internal expanding clutch, which gives no end thrust, is held to be the best for the average motor. Commendation is also accorded to the Hele-Shaw clutch, as it prevents the engine power being suddenly or fiercely applied to the gear, and allows of its slipping without injury to working parts. For the rest, the cog wheel type of gear will remain superior to the crypto gears, so long as the latter continue unimproved, on the score of durability. In the matter of speeds, all cars over 6 brake horsepower should be fitted with four, as on South African roads it is desirable that change of speed should be as gradual as possible, while a direct drive on the top gear is not of such paramount importance unless effected without interfering with the efficiency of other gears. In South Africa low gears are of as great or greater importance than the high, and the best form of gears is undoubtedly the cardan shaft bevel gear and live axle, its advantages being noiselessness, full protection of working parts and easy lubrication. In few cases, however, Mr. Hennessy declares, has this shaft been found sufficiently strong for South African work, either the whole shaft twisting or the jaws breaking. The design of the live axles also leaves much to be desired, they being seldom strong enough for the work. An ideal axle is one having an ordinary axle to carry the weight of the car and two cardan ones to convey the power to the road wheels.

The springs fitted to motor cars for South African use, as also the means of lubrication, are equally open to exception. On the latter point is is declared that sufficient attention has not been given by manufacturers to the efficient lubrication of all bearings from the dashboard. Sight feed lubrication is generally fitted to the principal bearings, with force pump to the cylinders; but, if fitted at all, there should also be a pump capable of forcing oil to all bearings. The best form of pump is an automatic pressure one, with a hand pump as a standby, as all other pumps are too easily affected by changes of temperature and gritty matter in the oil. In the matter of springs, their vital importance, owing to the state of South African roads, can hardly, it is affirmed, be realized by motorists or manufacturers at home. Those fitted by the average maker are seldom strong enough; and it has been found very difficult to make them so without seriously interfering with their resilience and the consequent comfort of the car. But the increased length of wheel base which has recently become general leaves the way open to fit longer springs, with greatly increased comfort in running.

As previously stated, the increased length of the wheel base is a factor conducive to effective springing. Other points connected with the wheel base are that, for comfort, all seats, back as well as front, should be placed between and inside the base, as, if they overhand the back axle discomfort must be felt by the riders in passing over bad roads. Increased clearance must also be allowed for beneath the car. In this particular all European models entirely fail to meet South African requirements, their bodies not being raised sufficiently from the ground to clear road obstacles. Moreover, in many districts the centre of the highway is from five to twelve inches higher than the sides, which makes it impossible for a car with only five-inch clearance—the maximum clearance of many cars—to proceed on them. For the same reason it is also a serious error of construction to make the flywheel the lowest point of the machinery, and the minimum should be the bend of the front axle. The dust nuisance, as has been previously pointed out at home, is also mitigated by the increased clearance.

Well designed worm and segment wheel steering gear, which is almost universally fitted to 8 horsepower cars and upward, is regarded as the best type of steering gear; but exception is taken to the otherwise excellent tiller steering gear of a unique type made by one well known English firm, because of its liability to be diverted by road obstacles and its dangerously ineffective control in deep sand. Some of the castings which carry the pillar, worm and segment of gears in many machines have also exhibited defects in use. In the matter of size of wheels, uniformity for all cars constructed for South Africa is requisite in order to reduce the storage room needed for spare tires; and with regard to wheel diameter, forty inches is a satisfactory size for cars of 10 horsepower and upward. If smaller they take from the comfort and smooth running of the car, and if larger they cannot be made strong enough to stand the lateral stress. The artillery type of wheel has proved itself most suitable for South African roads, while the wooden wheel is easier to clean and smarter looking than the wire ones, and is also held by Mr. Hennessy to be more lasting. In the matter of gearing, nearly all cars imported into South Africa are geared too high for the road conditions, and many of the smaller cars have not sufficient power for their seating accommodation.

CONTROLLING THE CHAUFFEUR

Regulations that are in Vogue in France and Some of their Shortcomings.

There exists in many quarters a burden of opinion that the only really successful issue of the much discussed chauffeur problem lies in a complete and comprehensive system of examination and license, whereby only those who are qualified according to certain well defined standards shall be permitted to handle an automobile as professional drivers. The principle already has been put into effect in the rather lax and weakling regulations of certain of the American States, and in several foreign countries as well, notably in France, where a very complete system has been worked out.

Undoubtedly the best proof of the pudding is in the eating, and no better argument, pro or con, can be obtained than is given by the actual way in which an idea works out in practice. Hence, the following extract from an article by Louis D'Hurcourt in Le Temps, showing how the typical French chauffeur is made, is particularly instructive.

"How does a man become a chauffeur today?" he says. "Usually in the following way: A young man out of work or without any visible means of support says to himself: 'Go to. I will be a chauffeur.' He has a few coppers in his pocket, and he buys a cap and the usual leather toggery and presents himself at an automobile garage, where he unbosoms himself of his intentions. For, and in consideration of, $30, the people at the garage undertake his professional education. That is to say, they let him get into an automobile and go around the fortifications with it. This they do for several days in succession, and they teach him the most elementary notions regarding the trade. After this he hies himself to the prefecture to pass his examination and obtain his permit to drive a motor vehicle in the public streets.

"The green chauffeur addresses to the prefect a request on printed paper for his certificate of ability. This request must be accompanied by a statement telling where he lives, by two photographs of himself and by certain other proofs of his identity. The prefecture transmits the request to the Minister of Public Works (Service des Mines), and an engineer of the Mines must put the youngster through his examinations. In the provinces things go the same way, the prefecture of police being naturally replaced by the prefecture of the department.

"The Service des Mines, having received the request, must then see that the candidate passs his examination before the engineer. In actual practice, the engineer of the Mines, having almost always something else to do, delegates his functions to a controlleur, or a vehicle in the public streets. . . .

"As the administration has no material especially reserved for these tests, it is incumbent upon the candidate to present himself with an automobile, either his own or a rented one. The examiner sits beside him and makes him drive the motor, meanwhile telling him where to go and how fast, and assuring himself according to the terms of the decree that he knows how to steer the vehicle, that he understands the mechanism, and that he possesses the required sang froid to manage it in the midst of the difficulties of crowded thoroughfares like those of Paris. Note this point, which is the weak spot in these examinations. We shall come back to it presently.

"This test, necessarily of brief duration (since, in 1902, for instance, the special inspector of Mines had to deliver 4,000 permits), is finished, and if it ends gloriously for the candidate, as it almost invariably does, the Service des Mines presents him with a conditional certificate of capacity, good for one month, and giving him the right to drive a machine in the public highways from that moment forward till the certificate runs out of date.

"The inspector transmits to the prefecture a statement of the registration together with one of the photographs. A month later—and without any new test—the officers of the prefecture of police, after being scrupulously assured of the candidate's identity, give him his official certificate gratuitously. He is now a chauffeur.

"Here, again, the inspector of the Mines has proceeded as seriously as it is possible for him to do under such trying circumstances. He even takes the precaution of mentioning upon the certificate of capacity the species of vehicle (with the maker's name and horsepower) which the candidate is qualified to drive. . . .

"No inquiry is made into the moral character of the candidate, nor even into his registration by the police, nor is a medical examination so much as suggested. The candidate may be a dipsomaniac, for instance, or subject to fits, or he may have some serious trouble with his eyes, and yet no objection is raised. Pray note that it is certainly more difficult to drive an automobile through the traffic of Parisian streets than to run a locomotive that cannot leave its rails.

"How, under these conditions, can the examiner really assure himself that the candidate possesses the sang froid and the intelligence necessary to prevent his becoming giddy when going at high speed, and to prevent his bringing about a splendid series of accidents? He may appear quite calm during the brief official test; in fact, he can hardly do otherwise, however scared he may inwardly be, when a high official is sitting beside him in the carriage.

"But, once turned loose and made his own master, what is going to happen if he has the drink habit or if he has an exceptionally violent nature? Now, observe that in the present state of things the certificate of capacity can be given to a young scapegoat and brawler or to one of those terrible youngsters who have already been several times sent to jail for drunkenness and assault and battery. The prefecture is not authorized by the term of the decree to examine the police registers except in the case of drivers of automobile cabs. But the drivers of private automobiles are hardly less dangerous to the public and to their masters themselves. 'We are not an employment agency,' said one of the officers at the prefecture when I spoke of these things. 'It rests with the employers of chauffeurs to assure themselves of the morals and antecedents of the men they hire. To search the police register every time a candidate applied would be a vexatious and a humiliating measure.'

"The lack of information regarding the chauffeur's morals naturally involves the gravest embarrassment. It is impossible to prevent them from taking the machine out of the garage and going on excursions of their own with it, unknown to their masters. Those who are not particularly conscientious and who have already acquired bad habits spend the night in roisterous company, and many accidents result. The owner can get no redress from a penniless employe; he must pay for breakage and repairs, and then swear if he likes to ease his temper. He dismisses the chauffeur and begins over again.

"There are no effective administrative measures to remedy this state of things. To be sure, there is an article in the police rules which says: 'After two violations of the law within a year, the certificates of capacity delivered in virtue of Artcle 2 of the present rules can be withdrawn by order of the prefect and on the advice of the Service des Mines.' But in actual practice this article is almost a dead letter.

"In the early days of automobilism chauffeurs thus recruited were almost invariably mechanics who had at least the professional qualities of the Parisian workingman and were capable of quickly deducing the causes of a breakdown and the means to remedy it. They had also the defects of the slum population, its lack of reverence for anything, its passion for idling and its weakness for the little glass. Many owners soon wearied of this sort of chauffeur and had their valets or their coachmen taught to run the motor. This was an especially good use to make of the coachman, who had little or nothing to do since the motor came into use. From the moral point of view this type of chauffeur was generally excellent. It is reasonable enough that a servant of sound character and good training should handle the wheel as well as the reins.

"But the remedy worked only in the case of owners who had already their men servants. A man who has decided all at once in consequence of falling heir to a fortune to buy an automobile cannot think of first taking a servant and then transforming him into a chauffeur. He prefers to get a qualified automobile driver, and there ore betakes him to some garage or other where a chauffeur is given him, good or bad it doesn't much matter, and generaly without any guarantee as regards his morals."

HIS TUNING UP TALE

Which Illustrates What Comes of Rush Work in Factories and Clamor for Cars.

"There are bunglers in the business of automobile building just as much as in any other line," vouchsafed the disgruntled one, "and let me tell you," he added confidentially, "unless some of them reform there will be vacancies."

"Are you still feeling put out over your experience with that car you bought last spring" asked the recipient of his tale of woe.

"Wasn't it enough to make an angel say things unfit to print? And my case wasn't the only one that happened. It might be put down as due to unavoidable oversight, if it only happened once in a season. I happened to be introduced to a new member of the club a week or two back and over a little refresher we fell to comparing notes. He had been taken in just about the same as I was. If you change the names, his story would fit my case, with this rather important difference, however. Being endowed with a somewhat better lined pocket he gave up his first love in disgust and sold it to a second-hand dealer before the end of two months. But not before he wrote the maker and told him what he thought of him. You can wager your last cent at 1,000 to 1 that that letter will never be published as an unsolicited testimonial.

"Why, you would scarcely believe it possible that a maker that advertises broadcast, sells his cars all over the country and enters them in races with more or less credit to their name, could last more than a single season if he let all of his product leave the works in such a condition of unfitness."

"Oh, it may have been nothing more than a coincidence that two cars should have been sent out that way and be sold in the same locality," was interjected. "Then, again, factory management changes sometimes and you may have been the victim of some incompetent."

"Coincidence nothing, though there's no doubt about the victim part of it. If there were only a few things wrong about the old wagon it might be put down to defective material that will sometimes find its way into the best piece of machinery made, but the whole thing is simply thrown together. Given the materials I'd back my sixteen-year-old boy to make a better job of assembling than that car represents to-day, and as for design, well it's all in the looks. I think a good many of the fittings, such as bolts and nuts, were never calculated for the purpose at all; you could buy them at any corner hardware store.

"Now you're too rough on the car, altogether," was commented. "You really haven't had so much trouble with the car once you got her tuned up, but you can't see anything good about it any more. Take Robbins, for instance. Could any mortal have more ill luck with a piece of machinery than he? You have had a great deal of satisfaction since the process of getting things in trim was done with. It's my opinion the manufacturers ought to charge you for the experience; you know how to get a car out of a tight place better than most of us now. Probably that was included in the cost of the car, and if the maker were marketing them all tried out, he'd add another five hundred."

"It cost me all of that. I'll confess I have had considerable satisfaction out of the machine, but you must admit I had no easy time getting her broken in. Take my first adventure, for instance. I drove the car myself as soon as I got it from the agent, and he told me it had cost him almost a century to get her in condition to deliver. He must have worn out the clutch facing in the process and put in a new one which I don't believe had ever been tried. He spent three weeks getting her ready, so I suppose he was more than glad to be rid of the job. Whatever had been worn out in the process of breaking in was replaced with new and then let severely alone for the looks of the thing.

"The clutch leather was one of the replacements, and it was only the allseeing eye of Providence that guards inebriates and children from harm that it did not make a subject for a sitting of the coroner of me, leaving a suit for damages at the same time. The maker was way behind on deliveries in the first place, and with the first balmy spring weather I pestered the life out of the agent to hurry the car along, for I was a new hand at the game and was simply crazy to get behind the wheel. I thought of it by day and dreamed of it by night, until my wife thought I was going into a decline and I all but lost my job through the asinine mistakes I made. The agent received the car, but found it needed so much tuning up that he wouldn't deliver it and didn't let me know he had it. His life was a burden to him if he had many more like me after him, for what with letters, telephone messages and calls I kept him on the jump, making excuses for his principal, who according to my reckoning was almost three months behind his promised date of delivery. There's an end to everything of course, and one Saturday the agent 'phoned me that the car would be ready for delivery that afternoon.

"We started off for a spin in the new acquisition—wife, family and all the relatives the car would hold—immediately after lunch. That is, one of the agent's men cranked the car until the engine turned over and then I tried to exhibit my skill in driving. We certainly made a fine getaway. With the motor well speeded up I pushed down on the clutch pedal and tried to shove her into first speed in good style, and I put plenty of heft into the lever as I put it forward. With a regular rip roaring crash of gears that sounded as if the entire inside of the gear box had gone to pieces, she jumped ahead as if struck by lightning, all but distributing the entire party over the roadway. If it hadn't been for bucket front seats and a high backed tonneau that is what would have happened. My wife and mother-in-law were sour as vinegar the rest of the afternoon from the terrific bump they got. My word for it, was a tooth racker. Worse yet. I all but annihilated a nurse girl with a baby carriage, but just missed them by giving the wheel a yank that sent us flying straight for the opposite curb. With the other hand I jabbed at the spark and shut her off and locked the brake with a suddenness that brought us to dead stop plump across the car tracks in front of a car going at full speed. The women all shrieked, men on the curb yelled and the motorman, after effecting a grand stand finish that brought the car to a stop within a foot of us, swore and glared at me. The agent's whole force swarmed into the street and pushed the car back to the curb it had started from, and the women folks decamped right then and there, both my wife and mother-in-law vowing that they would never go near one of the things again and were sure that I would be brought home dead before the afternoon was over. As things turned out it wasn't my fault the prophecy didn't come true.

"Well, after things quieted down a bit and the crowd had faded away, the motor was started again, and the agent, fearful of having a wreck in front of his place, politely suggested that he had better give me a pointer or two. I was actually too frightened to resent the inference of my lack of driving knowledge, and gave up the wheel without a protest. He handled things very gingerly, but in spite of that we seemed to jump a hundred yards the moment he let the clutch in—the way it took hold was something fierce. We seemed to jump a hundred yards in a bound before settling down, but then she slid along smooth as you please, and Mr. Agent thought he had made good and got out after we had gone a few blocks up along the parkside. My young boy was still with me, and when I climbed back behind the wheel he sat down alongside, still pretty well scared, I could see. It was with considerable misgiving that I went through the motions, but catching a clear space in the traffic I put the change speed lever home and released the clutch pedal. My heart came into my mouth at the jump she made, but we managed to get away without knocking any one down or smashing everything, and went along on the slow speed. My experience up to that time had been such that I would have been only too willing to let things alone, but it is far from satisfying to sit in a big car with the engine speeding and the car making about ten miles an hour, while everything on the avenue whizzes by with a hum, so I decided to try the high. I put my whole weight on the clutch pedal, and waited till I thought everything was quiet before shifting, never noticing that the car continued to move right along in spite of the fact that I was pushing down on the pedal for all I was worth. When I thought the psychological moment had arrived, I hauled away at the lever to get past the intermediate onto the

Digitized by Google

high. The crash that followed will ring in my ears till my hundredth birthday. It certainly speaks well for the quality of those gears that there was anything left in the change speed box after I got through that day. The new facing on the clutch was such a good fit that it didn't allow any clearance at all, while the pedal was so poorly adjusted as to allow of considerable movement that gave the impression that the clutch was out.

"We hardly got a mile and a half on our way up the avenue before we met our fate in the shape of a delivery wagon that cut across from one side to get into one of the transverse roads through the park, and the inevitable, aimlessly wandering nurse girl and her charge coming out of it. There was mighty little margin between our speed and twice the legal limit and things certainly looked interesting for half a minute. I stamped on the clutch pedal without the slightest effect—stood up on it almost, and jammed on the emergency brake. The motor was going pretty fast, so there was a fuss for a few seconds until I shut off the spark. We didn't hit anything, but the closeness of it gave me nervous prostration almost. Then we were dead in the midst of the traffic, so the boy jumped out and got her going again and she did her rearing stunt, just as a hansom came out of the park in front of us on the run. I wrenched the wheel over; we all but annihilated a policeman, tried to climb a lamp post on the corner, and I finally killed the motor again in time to avert a disaster. That was enough for me. As soon as I had succeeded in smoothing down the cop's ruffled feelings I made for the nearest drug store, got an ammonia cocktail for my nerves and telephoned the agent to send a man for the car. And we didn't go back in her either. If he had sent a man up to run her back I had made up my mind to give him a cigar and wish him luck, but he sent another car to tow her down, and my boy went along to do the steering while I started for home completely tuckered out.

"It was nothing short of a miracle that we didn't end up either with a fatal accident or a wrecked car that afternoon. The credit certainly belongs to my discretion in giving up so early in the game, for a few more shys at it such as we had, and things must surely have been messed up. Well, the agent put in the better part of the week on that clutch and pedal and next time it worked all right. But that was merely one experience not covering more than an hour from the time we left the garage until the car was towed back in disgrace. My experience with that car in the first three or four months I had it would fill a fair sized volume, and I can't recall one of the instances in which something went wrong, and several of them resulted in a tow home, that it wasn't due to lack of adjustment that could have been avoided if it had been properly attended to at the factory. For instance, the car drive shaft pulling apart at the sliding joint—that was the result of a piece of carelessness that left us perfectly helpless five miles from a repair shop with everything else about the car in perfect running order. Then another time a toggle bolt dropped out of the rear off spring on a dark night, and the way the tonneau listed and banged up and down on the spring was enough to make you think the car was falling to pieces. But then again it shows what good material was put into the car, for otherwise, the frame would have been twisted all to pieces with the strain of a full passenger list in the tonneau and going full speed over a rough road. A little straightening and it would be impossible to tell that anything had ever happened to the frame. But why bore you with details, there wasn't a time we went out that something didn't loosen up or drop off, until we had finally arrived at a stage where we had secured everything on her. Never again for me, though. The manufacturer does the tuning up on the next car I buy."

Austria Increases the Limit.

According to the new law promulgated in Austria and Hungary, all cars must be publicly examined before use, and must carry identification plates. In open country a maximum speed of 45 kilometres (28 miles) an hour will be permitted, reduced to 15 kilometres (9⅜ miles) in towns and villages. It is further provided that in all thoroughfares in which there is heavy traffic the speed must not exceed six kilometres an hour, while on bridges, in narrow streets, at crossings and in foggy weather it is forbidden for motor cars to pass any preceding vehicle. Just how they are to make progress under such circumstances is not made plain.

Geneva Advances a Claim.

It is a curious fact that in Switzerland, where chauffeurs by no means move in an odor of sanctity, the greatest number of them in proportion to the population is to be found, says La France Automobile. At least, this is true of the canton of Geneva, where 381 automobiles are registered and 424 motorcycles. This represents, then, more than 800 motor vehicles, as against a population of scarcely more than 100,000 souls. This figure is not to be surpased anywhere; it is greater by 50 per cent than that of other localities, either in Switzerland or elsewhere, where are found a greater number of chauffeurs.

When the Car Ran Away in Cork.

An amusing anecdote of a runaway motor car is going the rounds, which is attributed to the city of Cork, whose St. Patrick's Hill is called the steepest in all Ireland. It seems that a local physician left his car, a light runabout, about half way up this hill the other day while visiting a patient, and that as it lay close up to the curb a couple of lads began to investigate the uses of the various levers, with the ultimate result that they let off the brake and turned the car adrift.

Starting on a mad career down the incline, it first narrowly missed a horse and cart which were crossing an intersection at right angles to its course, and then proceeded by a series of caroms, first striking a railing, then an electric light pole, and finally a second pole, which it broke short off, overturning at the same time. A "bobby" who attempted to do things to it in its flight got a button of his coat entangled in the bracket of the tail lamp and went along with the parade, clinging to the seat to avoid being dragged in the street. The crowd which had gathered to witness the antics of the owner was considerably astonished to see him straighten out a lever or two after they had helped him to right the machine, adjust the cushions and ride off as though nothing uncommon had happened.

The Meeting of the "Graduates."

This is the conversation overheard the other day at a football game:

First Stranger (to second stranger, beside him)—Ah, these practice games in the early fall! How they remind one of his own college days, when he sighed for a position on the team!

Second Stranger (replying to first stranger)—Yes, they certainly awaken fond memories. What college do you claim as your alma mater?

First Stranger—Why, I graduated from the automobile branch of the evening school of the Bugsville Y. M. C. A. And what, may I ask, was your college?

Second Stranger—Oh, I received the degree of B. G.—Bachelor of Gasolene, you know—from the Correspondence School of Motoring.—(Ex.)

Would Arrest the Car.

At the present time the English motorphobe is far more virulent than his American confrère, though there is no telling how long the supremacy may last. The other day the town constable of Folkestone suggested to the watch committee of the Town Council that "magistrates should have power to suspend or revoke licenses to drive for any offence connected with the driving of a motor car; also, in serious cases, to revoke the registration of the car or to order the car to be impounded for a stated period, and to order the defendant to pay the costs of the car being stored." Quite an idea, that of arresting the car!

Special Counsel for St. Louis Motorists

So great has become the activity of the police of St. Louis, Mo., in the matter of arresting violators of the speed law, that the members of the local automobile club, at a recent meeting, decided to appoint special counsel to look after members who might fall into the toils. The action was a result of the action of the local authorities in appointing a number of special deputies to watch the principal roadways leading out of the city.

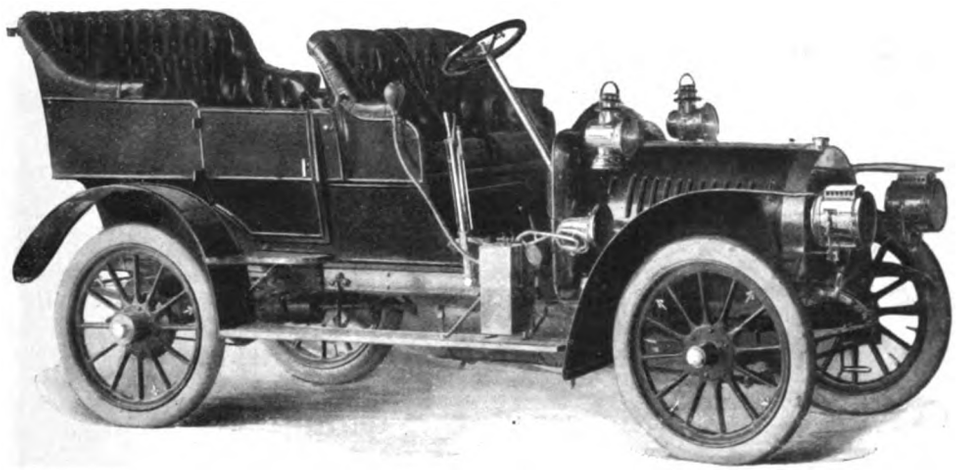
The New Model 1906

Rainier

30-35 H. P.

What is the automobile buyer going to do when he is strenuosly told that each and every one of the 1906 cars is THE BEST CAR IN THE WORLD?



He is going to do a little investigating.

He is not going to be attracted nor distracted by the whirlwind of words with which one car after another comes before the public on paper.

When he gets down to business, he will find the RAINIER in the front rank of cars that have won renown and made fast friends by actual achievement. He will find that in every inch of metal and wood, in every working part, in every line, the Rainier as it will take the road in 1906 is the very embodiment of strength, compactness, lightness and beauty —now more than ever before "The Pullman of Automobiles."

We want good Rainier agents in all unassigned territory. We can give them a car to sell that WILL sell, and that will make a new salesman of every purchaser. We stand back of the Rainier with the broadest and most liberal guarantee ever given.

Correspondence invited.

ENGINE.	30-35 H. P., 4 cylinders, water cooled.	**VALVES.**	Mechanically operated, inlet and exhaust interchangeable.
IGNITION.	Sims-Bosch Magneto—make and break spark.	**CARBURETTER.**	Float feed, requiring no adjustment.
TRANSMISSION.	Sliding train. 3 speeds forward and one reverse.	**BRAKES.**	Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
REAR AXLE.	Bevel gear drive, clutch driven hub. Ball bearings.		
FRONT AXLE.	I Beam section. Ball bearings.		
FRAME.	Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.		
WHEEL BASE.	104 inches.	**BODY.**	Full aluminum, double side entrance.
WHEELS.	Imperial whalebone, grade A 2nd growth hickory.	**EQUIPMENT.**	Two head lights, 2 side lights, 1 rear light, 1 horn.
TIRES.	Continental 34 x 4.		

Price, $4,000.

The 22-28 H. P. will be continued as heretofore, without any changes.

4 cylinder—98 inch wheel base—La Coste coil. French battery. Continental Tires. Aluminum side door body

Price, $3,500.

BOTH MODELS GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

The world's broadest and most liberal automobile guarantee.

Landaulet bodies for immediate delivery. Limousines for November and December delivery.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Boston Agents: MORRISON-TYLER MOTOR CO.

Good Agents wanted in unassigned territory.

The Week's Patents.

802,611. Wheel. Charles B. VanHorn, Philadelphia, Pa., Assignor of one-half to Elijah B. Cornell, Philadelphia, Pa. Filed May 20, 1904. Renewed March 30, 1905. Serial No. 252,920.

Claim.—1. The combination with an axle spindle sleeve, of a hub comprising an axle box mounted to rotate on said sleeve; conical surfaces at the opposite ends of said sleeve, conical wedge rings fitted to said surfaces in said sleeve and arranged to engage an ordinary vehicle axle spindle therein, and a nut arranged to shift said rings relatively to said sleeve and clamp the latter in stationary relation to said axle, substantially as set forth.

802,643. Vehicle Wheel. Charles E. Huxley, Chicago, Ill. Filed January 6, 1905. Serial No. 239,910.

Claim.—1. A vehicle wheel comprising a hub, a surrounding flexible rim composed of a plurality of curved jointed sections formed to provide on their outer sides an angular seat for a tire, and pneumatic means connecting the rim with the hub constructed to normally maintain the rim circular while permitting said rim to yieldingly flex inwardly.

802,665. Explosion Engine. Richard H. Scott, Lansing, Mich., Assignor to The Olds Gasoline Engine Works, Lansing, Mich., a Corporation of Michigan. Filed March 28, 1904. Serial No. 200,313.

Claim.—1. In an explosion engine, the combination with an explosion chamber, of a water jacket for the chamber, a supply port means for introducing the explosive mixture therein, and means within the jacket for simultaneously injecting water from said jacket directly into said supply port in the path of said mixture and adjacent a heated portion of said explosion chamber.

802,703. Tire Fastener. Thomas Midgley, Columbus, Ohio. Filed December 22, 1904. Serial No. 237,897.

Claim.—1. The combination with a tire, of a seat for the same having a plurality of parts adjustable toward each other in the operation of securing the tire to the wheel, and a wedging ring adjustable in length, adapted to force the said parts of the seat toward each other for securing the tire in position as set forth.

802,735. Pneumatic Tire Protector. Pierre O. Casavant, Point St. Charles, Canada. Filed October 26, 1904. Serial No. 230,007.

Claim.—1. In a protecting device for pneumatic tires, a serrated sheathing having radial, integral, lips, a chain approximately concentric with the inner ends of said lips, radial links connected with said chain, and means for connecting said lips with said radial links.

802,768. Rotary Engine. William N. Mears, Brookline, Mass. Filed February 13, 1905. Serial No. 245,341.

Claim.—1. A rotary engine comprising a casing, a cylinder eccentrically mounted therein and forming with the inner walls of said casing a chamber the area of which gradually increases from the inlet, then remains the same for a distance, and then gradually increases to the point of exhaust, pistons carried by the cylinder in contact with the walls of said casing and forming closed pockets therewith, an admission port opening into the narrowest part of said chamber, and an exhaust port opening into the widest part of said chamber.

802,798. Antifriction Bearing. Henry C. Burnett, Fort Maginnis, Mont. Filed March 25, 1904. Serial No. 199,933.

Claim.—1. In an antifriction bearing, the combination with a hub having a plurality of lugs, a spindle mounted within said hub and bearing elements secured to said hub and provided with lugs adapted to register with the lugs on the hub, said bearing elements each having a ball race, of balls within said races, flanges carried by the spindle adapted to engage said balls, one of said flanges being removable, retaining rings for said balls provided with a dust guard adapted to overhand said spindle flanges and having lugs adapted to register with the before-mentioned lugs, and bolts engaging all of said lugs adapted to hold the component parts in their relative positions.

802,806. Wheel Tire. Henry G. Fiske, New York, N. Y., Assignor, by mesne Assignments to Morton Trust Company, trustee, a Corporation of New York. Filed April 24, 1899. Serial No. 714,160.

Claim.—1. A single piece inflatable tire having a tubular fabric substantially concentric with the circular outside surface of the tire, and having an inner tubular portion the section of which shows a laterally contracted tube, the major axis of which is arranged transversely of the tire, a body of flexible, pucture resisting material between the upper part of the tubular portion and the tread, and a similar body of puncture resisting material oppositely disposed thereto.

802,828. Rotary Engine. Norman R. Smith, Seattle, Wash. Filed April 3, 1905. Serial No. 253,653.

Claim.—1. A rotary engine comprising a cylindrical casing, a rotatory head having peripheral lobes and mounted to turn in said casing with its lobes in contact with the inner periphery thereof and abutments arranged to swing in pairs upon and at opposite sides of a common center and continuously engaging the periphery of said rotatory head.

802,833. Acetylene Gas Generator. Martin Thayer and Jonathan E. Reynolds, Wareham, Mass. Filed October 12, 1904. Serial No. 228,148.

Claim.—1. In an acetylene gas generator, a hopper for the carbide, a valve consisting of a series of substantially parallel fingers projecting across the outlet from the hopper, and means ofr producing a longitudinal movement of said fingers in a direction transverse to the vertical axis of the hopper to control the gravity feed of the carbid from the hopper.

802,843. Rotary Engine. Clarence M. Cornelison and William B. Matlack, Mahafley, Pa. Filed May 10, 1905. Serial No. 259,745.

Claim.—A rotary engine comprising a cylinder having its bore opening through its ends, said bore being bounded by oppositely directed concentric arcs of different radii the ends of said arcs being connected by two portions one extending radially of the arcs and the other extending at obtuse angles thereto, said cylinder having an inlet passage opening through the first named of said connecting portions and an outlet passage opening through the other connecting portion, plates secured against the ends of the cylinder and having aligning openings therethrough said openings registering with the lesser arc, said plates having flanges extending into the openings at the outer portions thereof, brackets carried by the plates a shaft journaled in the brackets and extending through the cylinder, members mounted upon the shaft and lying in spaced relation to the inner peripheries of the flanges and within the inclosures thereof, expansible packing rings engaged with the members and lying within the inclosures of the flanges, flanges carried by members at the inner ends of the latter and lying within the openings of the plates and against the inner faces of the first named flanges, a piston including spaced sections secured at their ends to the inner surfaces of the members said piston lying in engagement with the inner wall of the cylinder which follows the lesser arc and lying in spaced relation to that portion following the greater arc, and a member slidably engaged between the sections of the piston and lying with one of its end portions in the space between the piston and the portion of the cylinder following the greatest arc with its extremity in engagement with said portion, said end portion of the member being adapted for engagement of the second named connecting portion of the bore of the cylinder for movement of the member to project its opposite end portion beyond the piston.

802,860. Vehicle Spring. Adolf Herz, Vienna, Austria-Hungary. Filed April 14, 1905. Serial No. 255,533.

Claim.—1. The combination with a vehicle spring of means for retarding the compression of the spring with one degree of friction and another means for retarding the expansion of the spring under another degree of friction.

802,905. Tire Inflating means. Gabriel A. Bobrick, Los Angeles, Cal. Filed May 31, 1904. Serial No. 210,386.

Claim.—1. Means for inflating tires comprising a tank for holding gas under pressure, a valve connected thereto, a reducing valve, a flexible tube and a coupling adapted to detachably connect with the valve of the tire and a valve between the reducing valve and the tire valve.

802,907. Nut Lock. John T. Boyet, Lewisburg, Tenn. Filed March 7, 1905. Serial No. 248,843.

Claim.—In a nut lock, a longitudinally grooved bolt, combined with a nut having a radial slot in its face extending from the bolt hole to its periphery, and a hole through the bolt near said corner, a dog in said slot angularly disposed thereto, and a pin passing through a hole in the dog and the hole in the nut, the ends of said pin bent to prevent its withdrawal.

803,006. Flexible Coupling. Joseph B. Meriam, Cleveland, Ohio, assignor to The Bruce-Meriam-Abbott Company, Cleveland, Ohio, a Corporation. Filed March 6, 1905. Serial No. 248,385.

Claim.—1. In a flexible coupling, in combination, a driving member, a driven member, a series of flat leather links placed in a circuit with overlapping ends, bolts passing through alternate ones of such overlapped ends into the driving member, and bolts passing through the remaining ones of such overlapped ends into the driven member.

803,008. Motor-Vehicle. Herman P. Moorrees, New York, N. Y. Filed October 6, 1905. Serial No. 227,336.

Claim.—1. In a motor-vehicle, the combination of a steering shaft or pillar, steering mechanism operated thereby, an electrically controlled friction-check co-operating with said shaft or pillar and comprising an electromagnet and parts directly acted upon thereby to vary the frictional contact thereof, and means to open and close said friction check, substantially as described.

803,009. Motor-Vehicle. Herman P. Moor-

Digitized by Google

rees, New York, N. Y. Filed February 24, 1905. Serial No. 247,084.

Claim.—In a motor-vehicle, the combination of a frame having longitudinal members and transverse members, bearings carried at the ends of said frame and by said transverse members, means to secure said frame to the body of the vehicle, independent axles mounted in said bearings, driving-wheels carried by said axles, motors secured to said transverse members, and transmission-gearing between said motors and said axles respectively, substantially as described.

803,011. Tire for Vehicle-Wheels. Charles Motz, Akron, Ohio. Filed January 3, 1905. Serial No. 239,529.

Claim.—1. In a vehicle-tire, the combination with the undercut channelled rim, of the elastic tire having projections adapted to fit said channelled rim, and provided with a series of transverse bars or stays, alternately arranged, having one end of said bars terminate under the inturned flanges of the rim, and the opposite ends thereof terminate above the inturned flanges of the rim on opposite sides; substantially as described.

803,032. Valve-Actuating Mechanism for Explosive-Engines. Lorenzo D. Toliver, Abilene, Kan. Filed December 13, 1904. Serial No. 236,679.

Claim.—1. The combination with the exhaust-valve, a means for automatically holding it to its closed position, and a reciprocable plunger-rod actuated from the drive-shaft to open said valve; of a support adjacent the outer end of the valve-stem, for the outer end of the plunger-rod, a deflector device pivotally mounted on said support automatically held to its different adjustments under spring tension, said device having oppositely-disposed abutments arranged to be alternately engaged by the plunger-rod, whereby to set the deflector device to bring the end of the plunger-rod in and out of alinement with the valve-stem for the purposes described.

803,053. Tire. Henry G. Fiske, New York, N. Y., assignor, by mense assignments to Morton Trust Company, trustee, a Corporation of New York. Filed June 17, 1899. Serial No. 720,915.

Claim.—1. In combination with a support-

MAKERS OF

Sheet Metal Parts

FOR

Automobiles.

For obvious reasons we prefer not to insert in our advertising matter, at this end of the season, illustrations of our 1906 designs and construction details. Those who are in correspondence with us, however, know what is doing. Manufacturers who want inside information will receive prompt replies to their letters.

Our two large plants are ready to take care of our rapidly increasing business. We can not only promise but make deliveries.

During the past season we sold 12,945 radiators to 54 bona fide motor car manufacturers, among whom are nearly all of those who have produced high-grade and successful cars.

Over 30,000

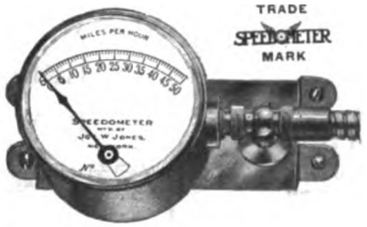
ing-felly, a pneumatic tire comprising a reinforced casing having an air-tight lining, the two parted circumferentially, inexpansible strips inclosed in fabric extending throughout the casing arranged at either side of the part presenting a relatively broad seat portion opposed to the flat felly periphery, means for mechanically holding the edges of the casing to form an air-tight inner cavity, lateral flanges in continuous engagement with the sides, and extending beyond the felly and holding the edges of the casing with the inextensible strips against lateral displacement, whereby the combination of the relatively broad base-strips and the lateral flanges securely holds the seat of the tire against twisting or lateral movement.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Motor World Publishing Co., 154 Nassau street, New York. ***

¶ The Metropolitan Police Department, at Washington, D.C., have used the Jones Speedometer as a positive means for timing the speeding automobilist, for several years. There isn't an officer in this squad who wouldn't testify as to the accuracy of the Speedometer.

¶ The Judge knows when the automobilist hasn't a Jones Speedometer on his car—that he hasn't any knowledge of his car's speed—and promptly says, "$100 or 30 days," or both.



¶ The automobilist who to day doesn't include a Jones Speedometer in his list of accessories is eliminating two-thirds of the pleasure of automobiling—and is encouraging the officer of the law to make his arrest.

¶ Our Speedometer Bulletin has information concerning our Protection Tag. This is free, if you'll write.

MORGAN & WRIGHT TIRES
ARE GOOD TIRES

Now it's a question of proof.

¶ During the past five weeks we have set forth in detail in these ads the claim that Morgan & Wright tires possess in a marked degree the essential qnalities of good, serviceable tires.

¶ Unless we have deliberately falsified in the statements made in our reasons why, we think we have furnished adequate grounds for our claim to tire excellence.

¶ As to the proof of these claims (and of our honesty) we have the most unassailable evidence from everyday users everywhere that these tires are more than living up to the claims made regarding them.

¶ They have proven repeatedly that the superior method of their manufacture and their tremendous reserve strength make them the cheapest tires on the market to maintain.

¶ And because they do prove this, they are mighty safe tires for you to have on your car.
¶ Clincher or Perfected Dunlop.

1906 1906

You cannot hear the sands of time dropping into space,
Nor the quiet Pope-Toledo pass at a mile-a-minute pace.

More Power, More Speed, More Room, More Style, More Strength, Less Weight.

Our 1906 Type XII, 35-40 H. P., "Quiet mile-a-minute Pope-Toledo," is the latest and greatest achievement of the world's largest automobile plant.

MOTOR consists of four individual Twin-head Cylinders, 4-cycle copper Jacketed, developing under brake test 43-44 H. P. All gears encased. The VERY REMARKABLE RESULT of securing ONE H. P. FOR EVERY TEN AND EIGHT-TENTHS POUNDS OF ENGINE WEIGHT HAS BEEN ATTAINED, and this, too, without in any sense sacrificing the strength or wearing parts.

CONTROL is simple, flexible and positive. The car can be driven on HIGH SPEED BEHIND A TEAM WALKING, or up to its MAXIMUM SPEED, simply by the use of THROTTLE AND SPARK, both located on the steering wheel.

TRANSMISSION is of the sliding gear type, having three speeds forward and reverse. Ball Bearings at all important points.

BODY DESIGN entirely new and of distinctive appearance.

Price $3,500.

ORDER NOW FOR EARLY DELIVERY.

In the meantime we have for **immediate delivery** OUR NEW TYPE X FOUR CYLINDER 20 H.P. CAR, one of the most efficient cars on the market. It is specially designed to meet the demand for a light weildy car of great power, which can be easily controlled.

PRICE $2,800.

1906 Ford 6 Cylinder Touring Car Price $2,500

6 cylinders 40 h. p. 4 to 50 miles per hour on high gear. *Perfected* magneto ignition—mechanical oiler, 114 inch wheel base, luxurious body for five passengers, weight 2000 pounds.

1906 Ford Runabout is as advanced as our touring car in design and even more surprising in price—will be fully illustrated and described early in December.

Both these Cars on exhibition at the New York Automobile Show.

QUEENS

ONE OF OUR THREE NEW MODELS

Motor.	4 cylinder—26-28 h. p.
Drive.	Shaft, bevel gear.
Frame.	Pressed Steel.
Wheels.	32x4.
Wheel Base.	101 inches.
Transmission.	Sliding gear.
Front Axle.	Solid-Forged.
Ground Parts.	All cylinders, pistons, piston rings, crank shafts, valves, universal couplings and transmission shafts.
Equipment.	Five lamps, horn, tools and storage battery.

We also have an 18 h. p. two cylinder touring car with detachable side door tonneau list at $1100.00, and a runabout 12 h. p. at $800.00.

Write us for complete details and agency proposition; it's interesting.

THE NEW THOMAS

Greatly Exceeds My Most Sanguine Expectations.

EXPERTS SAY IT IS A WONDER.

No customer is so critical or hard to please as the manufacturer, who, regardless of cost, absolutely determines to do his utmost to build the best Car in the world.

But, when an ordinary Stock Touring Car, without special preparation or intention, runs sixty miles an hour on the level and climbs a 10 per cent. grade on the high speed at forty miles per hour, within an hour after it first leaves the shop, it is something that not one Car in a thousand will do.

Under favorable conditions, we should do sixty-five miles an hour.

I am more pleased than ever with its speed, hill climbing, quiet operations and mechanical superiority, and cordially urge disinterested Automobile experts everywhere to rigidly investigate our claims and compare our material, workmanship and design with the highest priced Cars in the world—and we will win the verdict.

E. R. THOMAS,

THE CELEBRATED BRAMPTON CHAINS

Made from Self-Hardening Steel.

ALL SIZES CARRIED IN STOCK

Morris & Wilmarth,
Stock, Grain, Cotton and Coffee,
32 Broadway,
New York, July 22nd 1906

C. E. Miller,
#96 Reade Str.,
New York.

Dear Sir:-

I wish to write you regarding the Brampton chains which I purchased for my Franklin car.

No. 1 I have used all the time and have given it about as hard a pull as it is possible for a chain to receive. All over the mountains of Orange County, New York, and between New York, Philadelphia and Lakewood until I am tired of the road.

The long chain on the Franklin is a pretty stiff proposition and many, in fact, most of my friends state that their first trouble on that car is that chain breaks and I have met people who have worked for hours to get their chain fixed on the road, but I have never met a Brampton in trouble and mine so far has not a scratch on it.

No. 2 is in the paper in which your salesman wrapped it for me, and is resting in the bottom of the car waiting for No. 1 to break.

My partner, Mr. Wilmarth, President of the L. I. Automobile Club, has a Brampton on his Winton and has had practically the same result as myself. He got me in line for the Brampton and there I stay.

Very truly yours,

H. S. M. - G.

Oldsmobile Model S

¶ Following our more general announcement of last week, we here set forth in detail the leading features of our Four-cylinder Touring Car.

¶ In general appearance this car is strictly up-to-date. The front axle has been placed well forward under the radiator, giving a wheel base of 106 inches. The standard tread is 55 inches; but either 52-inch or 58-inch tread will be furnished to order. The general design of the car is such that the tendency to stir up dust when running is very small. Weight of car 2200 pounds.

Price $2250.

Cross section of the Oldsmobile four-cylinder motor

Motor: The car is equipped with a four-cylinder vertical water-cooled motor, developing 24 to 26 H. P. Cylinder, 4½ inch bore by 4¾ inch stroke. Pistons are carefully grounded, and "run in" with a belt to insure accurate fit. All the cylinders, pistons and rings are made from the best grade of cast iron from our own foundry. An exceptionally silent muffler is arranged longitudinally beneath the side of the car.

Valves: The valves are mechanically operated and easily adjusted. The fly wheel is carefully marked, and an index is placed on the crank case so that the valves may be quickly and accurately timed. All bearings are of generous proportion, and quarter boxes are of babbitt-lined bronze. The cylinders are cooled by means of water circulated by a gear pump. The radiator used is one of our own design, with a flat tube construction. A fan placed just behind the radiator aids in cooling the motor when the machine is standing still.

Crank Case: The crank case is of aluminum. The lower half may be removed without disturbing the bearings, which are hung from the upper half of the case. The crank shaft, connecting rods and pistons can, therefore, be very easily examined or removed without disturbing the hanging of the motor.

Digitized by Google

OLDSMOBILE

Frame: A pressed steel frame of channel section is used. In addition to the main frame, a sub-frame is provided which supports the motor and radiator. A portion of the dust pan which runs under the car is riveted between the outside and inside members, and gives a pronounced bracing effect. A portion of the dust pan is removable, so that the motor may be very easily examined, yet at the same time it is firmly fastened when in place and absolutely prevents the dust, mud and water from reaching the working parts of the mechanism. Both engine aad transmission are aligned upon the sub-frame, and all working parts may be removed without disturbing the hanging of the crank, or transmission cases.

Transmission: The transmission is of the sliding gear type, having three speeds forward and one reverse. All the gears are made of special high carbon steel, tempered and hardened. **The control is of the selective type, all changes being made with one lever.**

The clutch is of the "dish pan" or cone type, and is provided with a simple spring device whereby the load may be thrown on the motor gradually, thus doing away with any jerking motion when starting. The clutch may be thrown out by foot lever, and also by emergency brake lever.

Control: Steering is accomplished through a worm and nut mechanism. The nut has a large wearing surface so babbitted that same may be easily replaced at any time. The spark and throttle levers are placed upon the steering post, and just beneath and at the right-hand side of a 16-inch oval-rim steering wheel. An accellerator pedal is also arranged in such a way that it may be used with ease when it is desired to instantly increase the speed for a short interval.

Brake: There are two brakes; one, operated by a pedal control, acting on the cardon shaft, just back of the transmission case; the other, operated by a hand lever, which "sets up" the emergency toggle joint brake upon the rear wheels. Application of this latter brake throws out clutch, disconnecting transmission from motor.

Axles: The front axle is our own special design and is built of 2-inch tubing, having a ¼-inch wall. The steering connections have special large bearings, all these bearings being equipped with "T" handled grease cups, and protected by leather dust caps. The steering connections and gear links are adjustable so that the wheels may be easily lined up at any time. Axle is dropped in center to protect the fly wheel and other parts beneath the car. The rear axle is equipped with Timken roller bearings throughout.

Drive: Bevel-gear drive is used, having a ratio of 3 to 1. Ratio of 3½ to 1 or 4 to 1 will be furnished on special order. We do not recommend any lower than 3½ to 1.

Springs: Large, half-elliptical springs made of the best stock obtainable are used, the front being 36 inches long, and rear 48 inches.

Miscellaneous: The wheels have ten spokes in front, and 12 in the rear, and are equipped with 32-inch by 3½-inch tires. Four-inch tires for extraordinary service can be had on special order. Running board and mud guard irons, instead of being riveted on are drawn into taper sockets upon side members of frame and are easily removable. The lamp brackets are adjustable for different sizes of lamps; dash and tail light brackets are supplied. Luggage rack is equipped at rear on special order. A tabular horn, two acetylene head lights, generator and two oil lamps are furnished with each car. A box carried on running board contains storage and dry cells, tools and compartment for waste and small repairs.

"Firestone"

Side Wire Tires.

It takes knowledge born of experience to manufacture a tire that will continue to stand the strain of use on commercial vehicles.

In many instances trouble with tires has made a commercial vehicle unprofitable until Firestone Side Wire Tires were adopted.

We have in our office evidence of what Firestone Tires have done after many others had been tried and found deficient.

Then why not "Firestone"?

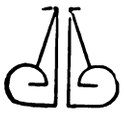
Congratulations

from a dealer in a rough-road country on the service obtained from

GOODRICH TIRES



WITH THE BAILEY TREAD.

"We wish to congratulate you because of the splendid way your Goodrich-Bailey tires have given satisfaction and service to us and our customers. They not only wear longest with the least show of use, but seem to be free from weak spots, such as fabric breaks and rubber and fabric parting company on the Tread, the latter seems to be a sure thing on some tires that we know of.

We are looking to 1906 Goodrich and expect to be partial to them, because we believe they deserve it if their previous reputation is any criterion to go by."

—*Asheville Cycle and Auto Co.*, Sept. 23, 1905.

THE BAILEY "WON'T SLIP TIRE." Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyright mark have been ispected and pronounced perfect. We guarantee our tires only on rims so branded.

The Expected Revolution Has Come!

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found he only good reason why you should *not* buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the *two* cycle two cylinder Elmore engine.

Understand—the *two* cycle two cylinder Elmore engine produces *two impulses every time the fly-wheel turns.*

As you know, the two cylinder *four* cycle furnishes only *one* impulse every *fourth* time the fly-wheel turns.

In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time n finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached ts climax this season after five years of steady improvement.

GROUT

GASOLINE 4-CYLINDER CARS

ARE NOT LIKELY to be passed by the agent who is wise to his own interests.

Price $1,800

Read these specifications—then think it over:

28-30 H. P., 4 cylinder, balanced motor, high tension ignition using one coil with distributing commutator.
Forced ventilation by fan.
Mechanically operated valves.
Inlet valves interchangeable with exhaust valves.
Control on steering wheel to gas and ignition, no motion transmitted to these levers by movement of steering wheel.
Gear, three speeds and reverse actuated by single lever.
Wheels, 30 inch artillery, wood, ball bearings, 3½ inch tires.
Armored frame.
Steering by irreversible worm and sector, dust proof and oil tight.
Lubrication; mechanically operated oiler, a definite amount of oil to all cylinders, crank bearings, connecting rod bearings, etc.
Lubricating system has received great attention and is particularly thorough. It is non-adjustable, that is, set at the factory and needs only to be supplied with oil.

Proved Construction Throughout.

THE GROUT, THE GOOD CAR

is built in the first factory in the United States erected especially for the manufacture of automobiles and by graduates of the school of experience.

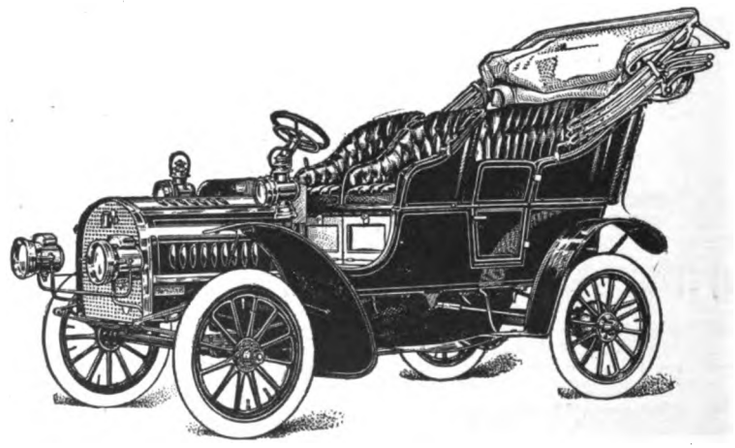
Rambler — A practical car for daily use.

In the design of the Rambler the primal object has been constant daily service and to that end has been provided abundant power coupled with extreme simplicity both in construction and operation.

The result is a car that will travel day after day through all conditions of road or weather and you stay in the the car—not under it.

Our catalog and the Rambler Magazine will give you details. Both are at your service.



Surrey Type One, shown below, a five passenger, medium weight touring car, ready for the road with lamps, horn and full equipment of tools, etc., $1200. Cape top, or canopy top with glass front, $100 extra.

Surrey Type Two, a five passenger touring car of more elaborate design, with double chain drive, full canopy top and glass front, $1650.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, November 16, 1905. No. 8

MOVING PICTURE SALESMEN

Interesting Experiment to be Tried by Maxwell-Briscoe—The Objects to be Served.

Moving pictures as an aid to the sale of automobiles are to be tried by the Maxwell-Briscoe Motor Car Co. Their idea is that by such means they will be able to establish small agencies and introduce their product in places where it has heretofore been unknown.

The company will send a number of its representatives in touring cars through sections of various Eastern States, each salesman carrying with him a complete moving picture outfit, including a large screen. On arriving in a town the salesman will arrange to give a moving picture exhibition in some public place. The views shown will include racing and touring incidents, including the performance of the Maxwell car in its trip up Mount Washington, and other interesting events. The travelling representatives will place agencies in many of the towns they visit, in addition to generally educating the public regarding the Maxwell cars. The first of these missionaries to start will be P. B. Blisdale, who begins work next Monday, starting over a route which includes many of the towns in Northern New Jersey.

Strike Up the Band! Hol-Tan is Coming.

Hollander & Tangeman, the American agents for the F. I. A. T. car, have leased the new five story garage on the northwest corner of Broadway and Fifty-sixth street, New York City, and will take possession about December 1. The building has a frontage of 50 feet on Broadway and a depth of 120 feet on the cross street. Simultaneously it is announced that the firm will become a stock company on January 1, taking the comic-opera title of Hol-Tan Co.

Elusive Promoter Finally is "Pinched."

Howard T. Heath, president of the International Automobile Co., of Chicago, which apparently existed on paper only, and for whom the police of several cities have been looking for some time, has at last been found and is now at Elgin, Ill., under $1,800 bail, to await the action of the Kane County Grand Jury. Heath was arrested on warrants sworn to by John Oberst and George Volsch, of Elgin, who alleged that Heath had "trimmed" them to the tune of about $1,400. Two more State warrants were served on the president of the automobile company this week through victims who assert they subscribed liberally to Heath's wonderful company.

Lowe Links with Wayne.

If there is not a substantial increase in the interest in Wayne cars and the number of them in use in New England, it will be cause for remark. George H. Lowe, former manager of the White Sewing Machine Co.'s Boston branch and the dean of the New England trade, has purchased an interest in the Wayne Automobile Co. of New England, at 509 Tremont Street, Boston, and, as he is so well and so widely known and his acquaintance is so large, sales are reasonably certain to follow where he leads.

Blackman Becomes a Sales Manager.

C. W. Blackman has engaged with the Parish & Bingham Co., Cleveland, Ohio, as manager of sales, and entered upon his new duties this week. Blackman is well known to the trade, having been for several years connected with a publication noted for its horselessness.

New Firm Buys Whole Output.

Douglass, Andrews & Co., who recently established themselves at No. 1,623 Broadway, New York City, with C. S. Tate as manager, have contracted for the entire factory output of Berkshire cars for next year. This means, of course, that the appointment of agents will be in their hands.

Spiers Leaves the Autocar.

John C. Spiers, general manager of the Autocar Co., Ardmore, Pa., has resigned his office, disposed of his holdings and entirely severed connection with the company. He has several irons in the fire, but is not yet ready to make disclosures.

Goes Back to Waltham.

The general offices of the Waltham Mfg. Co. have been again returned to the factory at Waltham, Mass. The transfer from No. 44 Broad street, New York, was made yesterday.

FORD SPRINGS TWO SENSATIONS

His Low Priced Runabout is One of Them but There's a Surprising Big Car, too.

Ford—that is, the Ford Motor Company of Detroit, this week uncovered two sensations—one a big six-cylinder 40 horsepower touring car at $2,500, and the other a four-cylinder vertical 15-horsepower runabout at a price between $400 and $500, the exact figure not having been definitely settled.

While perhaps the idea of a four-cylinder car at $500 is immensely sensational, and fraught with enormous significance to the trade, the runabout is really not so surprising as the touring car. While few, if anyone, expected that the runabout would be fitted with a four-cylinder engine, the matter of its low price had so long preceded it and had been a subject of so much discussion that the edge was rather taken off the sensationality of the official announcement.

Of the big car, little, if anything, had been said. It had been kept well under cover, and with practically every other manufacturer devoting himself to the perfection of his four-cylinder model, or designing one to be added to his 1906 line, that Ford was at work on a six-cylinder car entirely escaped notice.

In addition to these two new models, the Ford Motor Company will continue to make and market its two-cylinder opposed model at $1,000.

The picture of the $400-$500 Ford makes it appear not unlike the many two-cylinder, two passenger runabouts in use this season, with square bonnet and sloping rear body on which is mounted two individual seats. The specifications of this car, which will be styled Model N, as disclosed by the Ford advance sheet, are as follows:

Motor, four-cylinder, vertical; cylinders 3⅜-inch bore by 3¼-inch stroke, 15 horsepower. Speed, forty miles an hour down to three miles on high gear. Improved planetary transmission, with improved clutch. Seventy-eight-inch wheel base. Water cooled. Ignition, two sets of dry cells. Mechanical oiler. Gasolene tank, under seat.

Digitized by Google

containing ten gallons, sufficient for 200 miles. Water contained in radiator. Hub brakes—internal expansion, with lever control. Emergency brake on driving shaft, controlled by foot pedal. Springs, full elliptic in rear, and half elliptic in front. "Famous Ford" direct drive construction. Roller bearings on rear axle, with ball-bearing thrust—special design. Ball bearings on front wheels. Wheel steering (fitted with Ford reduction gears) takes all the strain from steering over the roughest road, an exclusive Ford feature. Luxurious body, carrying two passengers. Weight, 700 pounds. Fifty-six-inch tread. Wheels, artillery, 28 inch. Tires, 2½ inch. Lubricating oil sufficient for 200 miles. Color, maroon. Equipment, two side oil lamps, tail lamps and horn. Price $400 to $500—will be definitely decided shortly.

The specifications of the six-cylinder car, Model K, are as follows:

Motor, six-cylinder, vertical, 4½-inch bore by 4¼-inch stroke; 40-horsepower. Speed, fifty miles per hour, down to four miles per hour, on the high gear. Improved planetary transmission, with improved clutch. Pressed steel frame. 114 inch wheel base. Water cooled; circulation by gear pump. Perfected magneto ignition. Mechanical oiler. Gasolene tank under seat, containing 15 gallons—good for 250 miles. Water contained in radiator. Hub brakes—internal expansion, with lever control. Emergency brake on driving shaft, controlled by foot lever. Springs, full elliptic on the rear, and half elliptic on the front. "Famous Ford" direct drive construction. Ample roller bearings on rear axle, with ball bearing thrust—special design. Ample ball bearings on front wheels. Wheel steering (fitted with Ford reduction gears) takes all the strain from steering over the roughest road, an exclusive Ford feature. Luxurious body, ample for five passengers. Weight, 2,000 pounds. Price, $2,500. 56-inch tread. Wheels, artillery, 32 inch. Tires, 4 inch. Lubricating oil sufficient for 250 miles. Color (?). Equipment, two side oil lamps, tail lamp and tubular horn.

To Angle for American Visitors.

According to a French print, two or three Americans have formed a small company in Paris for the manufacture of motor cars, under the name of the Dolores. Their names are not given, but it is stated that their idea is to cater to those Americans who come to Paris in search of cars.

Verdict for the Dealer.

Because a car in which he was a passenger upset and inflicted some injury James Routledge felt called on to sue the Rambler Automobile Co., of San Antonio, Tex., for $5,000 damages. When the case was tried last week, however, James was presented merely with a chunk of wisdom. The verdict was for the defendants.

Union, N. J.—The Union Automobile Co., under New Jersey laws, with $10,000 capital; general automobile business. Corporators, Howard V. Weeks, Frank Hermance, Heber J. Ware, H. Joseph Kaiser, and William A. Maltus.

In the Retail World.

Landis Eberhardt has opened a garage in Tiffin, Ohio. Repairing and storing cars will be his specialty.

Raymond Perrigo and Wayne Stuch will start in business at Allegan, Mich., shortly. A new garage will be built in the spring.

Cole & Son have relinquished the Rockford (Ill.) agency for the Rambler cars. They will be handled next year by the Rockford Tack & Nail Co.

Grey F. Jansen has acquired the interest of F. I. Bills in the Davenport Automobile Co., of Davenport, Iowa. The company has plans for a new garage at the northwest corner of Fifth and Perry streets.

The McDuffie Automobile Co, of Chicago, will open a branch in Milwaukee, Wis., on January 1. The one story building now being erected at Nos. 228 and 230 Wisconsin street has been leased for the purpose.

Owing to his increasing business, W. B. Felker, head of the Felker Automobile Co., of Denver Col., has purchased the vacant property adjoining the garage at No. 1,535 Tremont street. A big addition will be erected in the spring.

What is claimed will be one of the most complete garages in the West when finished is to be built at Nos. 1,622-1,626 Broadway, Salt Lake City, Utah, for the Mathewson Automobile Co. The company has signed a lease for three years.

George Johnston and Frank Ruhl have taken over the business of the Keller-Needham Automobile Co., of Decatur, Ill., which was the monarch of all it surveyed, conducting the only garage in the city. It was owned by Johnson & Landis, who leased it to the Keller Needham Co. The new firm acquires the goodwill and machinery of the lessees and the property of the Johnson & Landis Co.

A. A. Atwood, Marshall Sheppy, Sinclair Berdan, A. M. Chesbrough and George Mills, all prominent business men of Toledo, Ohio, are behind a project to erect a large garage in that city. The company will be capitalized at $50,000, most of which has already been paid in, and the building will be erected on Monroe street, in the heart of the wealthy residential section.

William Dennin and Charles Kelly, comprising the Albany Automobile & Exchange and Troy Automobile Storage & Exchange companies, contemplate the erection of a new garage in Albany in the vicinity of State and Willets streets. William G. Reynolds, a local dealer, will probably consolidate with these firms and take charge of the new place.

A new garage was opened on November 8 by the Palace Automobile and Machine Co., of No. 208 West 124th street. A building of modern and fireproof construction has been built, which is thoroughly equipped for the work. The establishment will be under the management of Charles H. Barmsted.

Pending the completion of their large garage and salesroom at 89-90 Washington Street, the recently incorporated Greene Motor Car Co., Newark, N. J., have secured temporary quarters at 775 Broad Street. The concern takes its title from R. A. Greene, of Passaic, N. J., who is its president and who, notwithstanding retains his long connection with the Locomobile Co.'s New York branch. E. A. Greene is treasurer and W. C. Overman secretary and manager. The latter was formerly of the once world famous Overman Wheel Co., makers of Victor bicycles. The Greene Co. will handle Locomobiles in Northern New Jersey and also considerable Oldsmobile territory. In addition they will represent several foreign cars.

NO MOTOR WAGONS ON DOCKS

No One Objects to Them but None is Willing to Bear Increased Insurance.

The gasolene commercial vehicle has encountered a new obstacle which must be overcome. The owners or lesees of a number of the most important docks on the New York waterfront have prohibited the use of such vehicles on their property.

Where the ban on loose matches carried even in the pockets of laborers is so rigidly enforced it is not strange, of course, that such a situation should arise. But the queer part of it is that none of those concerned, the city departments, the dock owners, the steamship owners nor the insurance companies, have any real objections to the motor wagons.

It is all a matter of insurance. The insurance companies, with the same stubbornness that characterized their opposition to kerosene, now rail at even the word gasolene, but if any one will pay them enough they will sink their objections. They want some one to pay them about $1,000 per year for each dock on which the use of gasolene vehicles is permitted, and, of course, none is willing to pay it. Ordinarily the dock people carry such insurance, but they feel that motor trucks and wagons are not yet sufficiently numerous to justify such an outlay, and the insurance people, for the same reason, maintain that the risk is not such as is covered by their policies. There the matter is deadlocked, and although protests are being made, the question is one of the many which will be settled only by time and the more extensive use of such vehicles.

Preparing for the Olds "Circus."

It is late in the season for an outdoor, old fashioned tent circus, and particularly in Central Michigan, where just now there are three inches of snow on the ground, but one will be held at Lansing on November 17 and 18.

There will be at least one hundred performers, each doing his particular stunt and all under the direction of the Olds Motor Works. The circus will be the gathering of the Oldsmobile agents throughout the country, and provision has already been made for the accommodation of 108, and even more are expected.

The invitation to these different agents was issued in the form of a full sized circus poster sheet, with all its glaring headlines and the startling announcement:

"Come one! Come all! See the Gigantic, Gorgeous Glimpse of Gyratory Gyroscopic Go-Devils. Nothing even half so Good." . .

In the body of the poster is a large size drawing of a circus tent, the centre pole being plentifully topped off with Oldsmobile flags and the sides of the tent elaborately decorated with cartoons of the different agents, beginning with the "Duke of Albany, the only remaining member of the Swiss family Robinson," and extending around to "Monsieur Moriarité, from Missouri, who is to be demonstrated," while the flaps of the entrance are held open by "Silky Stokes" and "Little Fredie Smith."

It is intended to entertain the agents at a banquet and vaudeville show; but there will also be serious work, for the lines have been mapped out for an active, bustling campaign, and the agents will drill to act in unison to keep the Oldsmobile in the forefront the coming season.

Ford in Larger Quarters.

On November 3d the Ford Motor Co.'s New York branch moved into its new quarters at Broadway and 55th street, where are more commodious accommodations for both salesrooms and garage than were afforded at its former place of business in the Old Guard Building. At the same time the occupation of the old place was taken up by Douglas, Andrews & Co., who will use it as the headquarters of the Berkshire Automobile Co.

Boston Show Set for March.

Boston's automobile show will next year, as this, be held during the second week of March, the 10th and 17th. Mechanics Hall having been again secured. No date has been set for the allotment of space, but it is understood that nearly all the available room has been spoken for. It is doubtful if an "Impostors" show in Symphony Hall will again be attempted, since last March's "imposition" proved such a miserable fiasco.

Briscoe Gets More Room.

The Wheeler Mfg. Co., Detroit, Mich., having taken possesion of a new plant, the Briscoe Mfg. Co. have promptly acquired the vacant Wheeler factory and added it to their own extensive plant. It affords an increase of 15,000 square feet, which, with their Eastern factory in Newark, N. J., places them in position to promptly meet all calls for their radiators, fenders and the like.

Cleveland Fixes Its Show Dates.

Probably to comply with the recent ultimatum of the National Association of Automobile Manufacturers, the Cleveland (Ohio) Dealers' Automobile Co. has announced that it, and not the Cleveland Automobile Club, will this year promote the annual show to be held in the Central Armory. The date has been set for the week of February 18 to 25. George Collister has engaged as manager.

Locomotive Company Imports French Experts.

Two French automobile engineers, Messrs. Rouset and Pinneau, who arrived in New York this week, are the forerunners of a group of experts and mechanics who will take up the automobile work of the American Locomotive Co.

HERE'S A CHICAGO HOWD'Y'DO

Partners Fall Out and Charges of Perjury and Other Things Promptly Follow.

The courts will be called upon to settle the differences between J. E. Haschke, proprietor of a local garage, Clair A. Orr, treasurer of the Marquette Electric Co., and Henry A. Wehyl, a banker, all of Chicago. The garage keeper has filed charges of perjury against the other two men and named them as defendants in a suit filed in the Superior Court for $25,000 damages, alleging malicious prosecution. The suit follows the arrest of Haschke on a charge of appropriating machinery. The case was dismissed by Justice Martin upon the production by Haschke of an agreement between Orr, Weyl and himself looking to the formation of a corporation for the manufacture of an electric battery invented by Haschke.

The corporation was never legally formed, because, acording to Orr, Haschke failed to satisfy them of his claims. Mr. Orr declares that all business relations between the three then ceased. Haschke says that Orr and Weyl furnished $1,500 for a garage at No. 8,789 Ashland boulevard, and for a time paid rent and wages. Recently, he alleges, they refused to pay rent and were sued by Aldis & Co., who were given possession of the property. Haschke says he gave up a part of the property and arranged with the proprietors to continue business. Haschke then moved a part of the machinery from the premises and was arrested. Haschke charges that Orr and Weyl denied in court having ever paid rent or salaries in connection with the garage, which, he declares, makes them guilty of perjury. Warrants have been sworn out for Orr and Weyl.

How Providence Honored Hughes.

Archie Hughes carried with him to his new home in Philadelphia a French clock, a gold matchbox and a silver flask as tangible evidence that the friends he made in the old one, Providence, R. I., entertain more than passing regard for him. The clock was a gift from several intimates, the matchbox one from the employes of the Pope branch, the management of which he relinquished last week, and the flask a memento from a number of Rhode Island Automobile Club men. Hughes and W. J. Foss constitute the new Foss-Hughes Motor Car Co., in Philadelphia, and, in addition to the gifts, both were the guests of the Rhode Island club at a complimentary smoker given in their honor.

Carrie Returns to Haynes.

F. G. Carrie, former manager of the Haynes branch in New York, has returned to his old post. His resumption of the duties was almost concurrent with the arrival of the first 1906 Haynes car in the city.

CADILLAC UTILITY

THE SINGLE CYLINDER CADILLAC
Will climb any hill that any automobile will climb.

THE SINGLE CYLINDER CADILLAC
Will travel any road that any automobile will travel.

THE SINGLE CYLINDER CADILLAC
Will travel as fast as anybody ought to ride.

THE SINGLE CYLINDER CADILLAC
Costs less to operate. Costs less to Maintain.
Requires less attention than any automobile we know of.

Because so many people know these, and some other things, probably accounts for the fact that more Cadillacs were sold during 1905 than any two other makes combined, and won for them the unquestioned distinction of

AMERICA'S LEADING MOTOR CARS.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, NOVEMBER 16, 1905.

No Gold Dollars for Fifty Cents.

Probably as long as the world remains round, the human desire will exist to obtain goods of whatever nature at less than catalogue prices. It follows that during that eternity of time there will be those who will endeavor to turn to their advantage this human failing, or inclination or whatever it may be. The price-cutter in varying guise always will be with us, and he will continue to angle for "suckers," to use an expressive if inelegant term, with pretty much the same old baits.

The Motor World's series of articles reporting the results of its investigations of several of the institutions professionally anxious to save the dear public from the payment of manufacturers' prices on automobile wares indicate that their wiles and ways are quite the same that have been practiced in older industries.

Their heraldings of discounts and cut-prices are means chiefly to the same old end—to attract prospective purchasers to their stores, and then more or less gently practice the game of substitution. Usually they are "just out" of the standard articles the purchaser most desires, but as always, they have something just as good, and, also as a matter of course, they are ready and willing and very anxious to sell it at a lower price than the article which is a "known quantity," and which has acquired a proud reputation, generally at the cost of a considerable fortune and years of effort. To combat this reputation, the price-cutter must needs have a strong weapon, and at this time none is so strong as the cry of "Trust." The way it is wielded by the price-cutters of the automobile trade, the unknowing might well suppose that there practically is no reputable product pertaining to automobiles that is not in the grasp of a vicious Trust. It is all very amusing to men who know, but that there are many persons who gulp down the Trust morsel without "gagging" is evident. Like the "come-on" in the green goods game, they are well aware that in buying the just-as-good stuff that is palmed off on them, they are "taking chances," but often they take them for the matter of a mere dollar or two.

The man who would "rather be sure than be sorry"—and in the use of automobiles particularly, that policy pays unusually large dividends of satisfaction—knows that it is impossible to obtain gold dollars for fifty cents, and that any person who holds out such an inducement has some ulterior purpose to serve, and is therefore to be considered an object for suspicion. The price cutter is in ninety-nine cases out of a hundred a gold-dollar-for-fifty-cents man. He knows he has no gold dollars, that is, standard wares, to sell at that price, but he strives to make it so appear in order that he may attract "come-ons," to whom he schemes to sell gilt pieces that may look just as good as the gold dollars. The price-cutter rarely rings true.

The Punch from the Postoffice.

It will be interesting to discover which particular red-taped exponent of progress in the Postoffice Department is responsible for the order prohibiting the use of motor vehicles in the rural delivery service. For of all the assinine, illogical reasons ever advanced to excuse official action the ones given in this case by the Fourth Assistant Postmaster General are entitled to high rank.

The conditions of roads and bridges vary and not all of the automobiles with which carriers have been permitted to experiment have proved reliable—these are the reasons given. The crux of it all is, of course, that on occasion mails have been delayed. It is easy to imagine that very many of the rural carriers have used cheap and unreliable machines on roads unsuited to them, but to arbitrarily rule that no carrier shall employ such means no matter how good his conveyance or how good the roads or how many hours he has quickened the delivery of mail matter, because of such speed-means, is the rankest heresy.

The same species of logic should also rule out horses because horses also differ and it is not infrequent that they go lame. And railway trains—there are some portions of the country in which nothing is more unreliable than the trains. Why then permit them to carry mail matter?

If the Department set up a standard of some sort and settled each case on its merits, there would be no fault to find. But a sweeping order that makes no distinctions, that rules out the efficient and the inefficient alike, is a form of the bureaucracy that so often nettles and makes officialdom the laughing stock of the world.

Because the carrier in the roadless State of Mississippi cannot maintain a schedule, the people in New Jersey or Massachusetts, where splendid roads abound, must suffer that their mails be delayed hours beyond what the motor vehicle renders possible. That certainly is a chunk of sand-papered logic that a man of the Roosevelt type should readily swallow if it is properly served up to him. The automobile organizations should see to it that it is so placed before him. For by inference and in effect that order of Fourth Assistant Postmaster General Whatshisname is just about as nasty a slap as ever an industry received from a supposed paternal and protective government.

Why the Two-cycle Engine.

Undoubtedly the fact that the makers of the Oldsmobile have decided to include in their line for 1906 a car equipped with a two-cycle engine, will do much to direct a very greatly increased volume of attention to that type. Its adoption by a concern of such size, importance and world-wide repute is, indeed, the biggest boost the two-cycle motor ever has received, and eyeliftings will not minimize its import.

Although the records of the Patent Office abundantly testify that this type of motor has received generous effort at the hands of inventors, the fact that the manufacturers of the Elmore car have long remained as

Digitized by Google

its only conspicuous exponent in the automobile field, has served to make the two-cycle of restricted interest.

This state of affairs is largely accounted for by the fact that although many designers have at one time or another turned their attention to a more or less serious consideration of the two-cycle problem, the great mass of authentic data on the four-cycle motor which is ready to hand, and the comparative certainty of success in following a beaten track, has led most of them to turn into the well travelled way, and leave the necessary experimentation to others.

Thus the two-cycle engine has been largely kept confined to the boat industry, and to some extent to the stationary field, in both of which the demands upon a motor are far less rigorous than in automobile work. The Elmore car has, however, valiantly held its own, and it is a matter of common understanding that that best of criterions, the balance sheet, never spoke more eloquently of success than this year and is such as to give most emphatic refutation to the idea that the two-cycle motor is unfitted for the work of propelling road vehicles.

A close study of the principle of the thing would show this as well, for upon the face of it, the object of halving the variation in the turning moment of the common type of motor, that is to say, making its operation twice as steady, is what has been gained in that type only by the introduction of additional cylinders. If the two-cycle motor is the equivalent of the four-cycle motor of double the number of cylinders as far as the number of impulses is concerned, and nearly its equivalent in point of efficiency and power, then, granting an equal amount of flexibility in control, it should be worth twice as much, for it will weigh only half as much, and cost hardly more than half as much to build, and surely these are considerations worth a deal of striving for.

Fashion and Weights.

In any industry, that phenomenon which in its relation to the design of feminine headgear is called fashion, and in its relation to the design of machinery is called common practice, ebbs and flows like a complex, swirling tide, turning hither and thither under the influence of this condition and that, but just as surely ebbing and flowing all the time. Thus in process of time this or that feature which was sanctioned yesterday meets with little or no approval to-day, and to-morrow becomes obsolete or else resumes its former prestige. This phenomenon is as noticeable in the automobile industry as it was in the early days of the bicycle industry, as it is in every industry.

In the automobile trade the whole trend for a time was toward an increase in the size and weight of cars. Then the demand for increased speeding power and hill climbing capacity called for a greater ratio of engine capacity to weight, and to accomplish this the first step was to lighten the car. The second step was to improve the motor, both in minor detail and using an increased number of cylinders of smaller contents than had formerly been done. Thus the industry stands to-day, the engine of the standard type of car far more powerful than it need be to propel the car at rational speed over good roads, the weight for the most part being fined down to the limit of safety, yet still in excess of what should be necessary, considering the carrying capacity. And still the cry is for less weight in order that there shall be less strain on tires!

In many cars already on the market, and in many which will be sold within a twelvemonth, the weight is and will be cut down to the limit, and below it. There is a certain ratio between the weight of a car and the speed at which it can be driven safely on the road. This ratio has yet to become a recognized factor in motor car design, but it is none the less existent and important. To lighten the machine without decreasing its highest speed capacity, which is the measure of its maximum performance, is to produce a machine which will not stick to the road, but will bounce about and become unmanageable under certain circumstances. Moreover, to lighten the weight on the tires does not necessarily involve a lessening of the wear on those parts, since practical results have shown all along that, keeping within a certain range of tire sizes for a given weight, the life of the tire depends more upon the driver than upon anything else.

One of the most significant triumphs in the bicycle industry came when the manufacturers succeeded in getting the public to accept a heavier machine than had been popular, and the tide set away from the craze for flimsy products which rivalled one another in lightness. It followed a practical avowal on the part of the makers that they could not wisely nor safely cut down weight beyond a certain limit. So, in the automobile business, a turning point must come, when the limit to the further reduction in weight will be found and the maker will dare go no further. To talk of lightening the car to save the tires is but begging the question. The tires are all right as far as they go, but they need a better supplemental action in the suspension of the car. The light car is all right, but it cannot safely be made a fast car.

What is most needed in the machine of the day is stability in every fibre. To a certain extent this can be secured only by the use of heavy materials. Certainly the rigidity and durability in every part, which alone can make for endurance, can only be secured by the use of the highest grade of materials. Hence, to lighten the car without decreasing its power, involves a greater first cost to the maker and so to the user, which is not what either desires. So in working toward the ideal combination of practical efficiency and low cost, the reduction of weight must certainly be made an entirely subordinate factor.

Effects of Motor Trucks.

One of the most notable features of the growth of the commercial vehicle trade is the vast amount of territory over which the use of this class of automobile is spreading. In the beginning of the present industry, the sale of cars was confined in great measure to those wealthier communities which lay in the immediate vicinity of the factories. The sale of commercial vehicles is not so confined. Rather is the bulk of the business particularly in trucks and other heavy vehicles, coming from some unexpected places which serve to illustrate vividly the tremendous superiority of motor over animal power.

The recent bridging of the desert by a motor stage line which cut down the former journey of days to a matter of a few hours, is a much published example of this. In the same light is the news printed in another column of the substitution of a trio of motor trucks for a string of seventy-odd pack mules which had been used for the carriage of ores for seaboard shipment in Honduras, and which reduce the travel from six days to one. All of which furnishes the best possible recommendation for the commercial motor, in that those who are applying it in frontier work find it the solution of a troublesome problem, and that its advertisement is thus made world-wide and practical rather than local and dependent on the efforts of the press agent. As its potency becomes better known the motor truck will carry good roads into the hearts of benighted countries and thus add to the enlightment of the world. For if one such truck will do the work of a score of mules, even the mule countries must awaken.

SEEKING THE 35 PER CENT

But the Buyer Found it Applied Only to Justasgoods—His Interesting Experiences.

Having visited a "protective league" and a "buyers' association," each of which held out glowing inducements of supplies at less than manufacturers' prices, the Motor World's "owner of a second hand car in search of equipment" found it impossible to resist the magnetism of a New York window on which "35 per cent" is emblazoned in heroic dimensions. He hoped that there he might escape the cry of "Wolf!"—that is, of "Trust"—and find instead of substituted just-as-goods the standard wares which he sought, but for which he was disinclined to pay catalogue prices, and, incidentally, learn how the less-than-list figures were made possible!

When he entered the establishment of the concern the manager, or at least the man in charge, was busily engaged in decorating the "35 per cent" window with robes, leggings, hats and the like. Everybody seemed busy about nothing in particular, and after waiting in vain for some one to wait upon him the buyer timidly approached the managing window decorator.

"Do you give 35 per cent?" he asked.

"Why, certainly," replied he with the artistic proclivities. "Don't you see our sign? What can I do for you?"

"I want to get some tires," replied the Buyer.

"We can give you anything you want cheaper than any other firm. What kind and what size of tires do you want?"

"The Blank; 30x3½-inch."

"Well, now you've got me there. I can give you any other make, but the truth of the matter is that the Blank people are not making any more thirty-three and a half now."

"Why, that is strange; I was just into the Blank company's place, and they said they had plenty of tires of that size, but would not give me a discount on them; so as I saw your sign of 35 per cent off I thought I would see what I could do with you."

"I don't understand it," said the salesman with a deprecatory wave of the hand just like a Baxter street dealer in cast-offs. "We have not been able to get any of that size. Why don't you take the Just-as-good tire. I can let you have them."

"Let's take a look at them," said the Buyer.

Mr. Salesman rummaged through a pile of pneumatics of all shapes, sizes and makes, but apparently was unable to find one of the Justasgoods. Telling the Buyer to wait a minute he dashed out of the store and returned in a few minutes with one of his pet leaders.

"The regular list price of this tire is $—, but I can let you have it for $—."

The Buyer had purchased tires before, with and without discounts, and a grammar schoolboy would not have to rack his brain long to figure out that the price the salesman named was less than 15 per cent off.

"I though you gave 35 per cent off," said he to the salesman.

"Well"—this is where the discount house, or at least its representative began to hedge—"you see we do not guarantee you 35 per cent off on everything." Referring to the catalogue: "You save an average of 35 per cent when you buy from us. Of course, there are some trust goods that we could not allow you that much—it would be more than we get ourselves. That would hardly be good business would it?"

Then he opened a catalogue of the firm and referred to the paragraph in justification.

"Couldn't you give me better prices if I were to buy a set of four, all complete?"

"Well, now, that is different," acknowledged the salesman, brightening up a bit. "I can on the Justasgood tires, because, you see, they are not in the trust. How would an additional 5 per cent strike you?"

"How can you afford to give such discounts on tires if the manufacturers don't?" politely inquired the Buyer.

"If you want to know such things as that you will have to see the general manager of our downtown store!" snapped the salesman.

The Buyer really wanted to know so badly that he called to see the manager. But business was evidently slack at the downtown establishment, as the general manager had gone to shoot ducks at Barnegat Bay. In his absence, and after varying processes of evolution, however, the Buyer found himself in tow of a salesman, whose curly locks of auburn hue were his most irresistible characteristic. Practically the same tactics were assumed as at the uptown establishment. It was impossible to get any of the Blank tires, but they had Justasgoods in quantity, and also they recommended highly a German tire which they could supply. No extra 5 per cent, however, was forthcoming. The curly-haired salesman was willing to incur the displeasure of the firm by letting the Buyer "get next" a money saving proposition.

"You said you wanted some lamps?" interrogated the salesman. "Now, I would not advise you to buy the Douse or the Glimmer; not that they are not all right, mind you, but because they are in a trust and it is impossible for us to give you 35 per cent off. If we did the firm would lose money, and, furthermore, the manufacturers would cut off our supply if they discovered we were cutting prices. Now, here is a lamp—one of the French kind that never sells less than a hundred—we can let you have it for $— for the pair, without a generator, or $— complete."

The Buyer examined the glittering array spread before him. Each headlight had a little nameplate bearing the name of the firm in whose store he was.

"I thought you said these were French lamps. Then, how is it you have your nameplate on it?' he asked.

"They are French lamps—that is, of the French type—but they are made expressly for us," was his explanation. "Now, I'll tell you what I'll do. If you'll promise to place the order for the tires I'll quote you a price on the lamps that will make you think you paid for beer but got champagne instead. How 'bout it?"

"All right," acquiesced the Buyer.

"I'll let you have the lamps, complete with a generator, for $——," naming a ridiculously low figure.

The salesman with the twist auburn locks was evi lently pleased with the good sale. His face bore an unmistakable grin and he whistled a bar of "Tammany." Visions of a long looked for "raise" probably flashed through his brain. Anyway, he was communicative to a certain degree.

"It's just this way," he replied in answer to the questions concerning discounts. "Suppose you are in business. You sell three lots of goods a month and you realize a profit of 100 per cent. You sell at net prices, but your sales are few and far between. I am in the same business. I buy my stock in larger quantities and advertise to sell at a big discount. My profit is the same as yours, but I am willing to divide with the buyer. I only make half as much as you, but instead of three sales a month I make three hundred. Now, who is going to make the more money, you or I? There is only one side to the question. As I told you before, on account of the tire trust, the supplies trust and numerous other trusts, we cannot quote you a straight discount of 35 per cent on everything we sell, but as we can offer a discount of 50 per cent, or sometimes even 75 per cent on other things, goods that we have made expressly for us and equal in every respect to the trust product, why it is obvious that you are going to save an average of more than 35 per cent if you buy from us all the time."

"But say, old man," exclaimed the salesman, patting the Buyer on the shoulder—a familiarity some clerks indulge in when they have something important to tell you and whisper so no one will overhear—"your supplies are going to cost you quite a sum of money, and it evident that before you get through equipping your car you will run up something of a bill. Now, if you could get rid of it, we have a good car here—it belongs to the manager—that we can let you have at a figure that will give you another mild case of locomotor taxia. It is fully equipped and you won't have to spend a cent for that sort of thing."

"I thought you only sold supplies," naturally exclaimed the Buyer, kind of surprised.

"So we do! So we do! But this car belongs to the manager, and as he has no further use for it he wants to get rid of it. Brand new last spring; two cylinder 16 horsepower, but it really develops more than that, and will take any hill in these parts on the high. The manager paid something like $1,400 for it, and this year has spent over a thousand for improvements. Ah! but say, it is a beauty. If you can sell your car you can get this out, all complete, for a mere 'widder's mite.'

"How much?" asked the Buyer.

"Oh, I do not know; but if you'll come around Monday morning at, say 10, why the manager and you can fix it up between yourselves."

The Buyer is still considering the matter!

When Touring is a Not Unmixed Pleasure.

ONE OF THE GOOD(?) ROADS ENCOUNTERED BY MR. AND MRS. H. G. WOODWARD NOW EN ROUTE FROM MAINE TO ALABAMA.

Digitized by Google

FREEZING PROBLEM SOLVED

Results of Souther's Experiments with Anti-Freezing Mixtures and his Recommendations.

(Reprinted by request.)

During the last severe winter I made some practical experiments in the way of learning what mixture could be used in the cooling system of an automobile that would prevent freezing and at the same time not be in any danger of injuring any part of the automobile.

Various salts, glycerine and wood alcohol were considered. Wood alcohol was chosen for the first experiment because there was not the slightest chance of its injuring the machine. The success was such and the duration of the test was so long that nothing else was tried.

The character of the experiment conducted was this:

First—A set of laboratory freezing experiments to determine what percentages would freeze under artificial conditions. This showed at once that it was possible to use wood alcohol and water and resist almost any degree of cold.

Second—The next question to answer was whether or not the wood alcohol would separate from the water and waste away so fast that the scheme would be too expensive. Of course, this possibility amounted to but very little in extremely cold weather, but in mild days it was felt that considerable alcohol might be lost.

To demonstrate this point a water cooled machine was taken, and about 18 per cent. of wood alcohol was added to the mixture. The whole system contained about seven gallons.

Various experiments were made by connecting a bottle with the top of the radiator into which a pipe led from above the water level, the idea being that any vapor formed would rise into the cold bottle and condense. It was found that, except under extreme conditions, no vapor at all arose. By extreme conditions, I mean any mild day, allowing the machine to run standing still, there being no fan for cooling.

This immediately led to the thought that it might be possible to entirely close the system in cold weather, thus obviating any chance of loss by boiling away. This was done and a pressure gauge put on and connected with the system. The highest pressure obtained at any time and under very severe conditions was six pounds.

This means that there are some machines that can be run with the use of alcohol without any loss whatever, there being a certain number of makes that run with a closed system. In my own case, I added some 30 per cent. of alcohol and found 20 per cent. remaining at the end of thirty days.

It is also quite possible that many machines can be run with a closed system that now have relief tubes. The safest way to find this out in an inexpensive manner is to

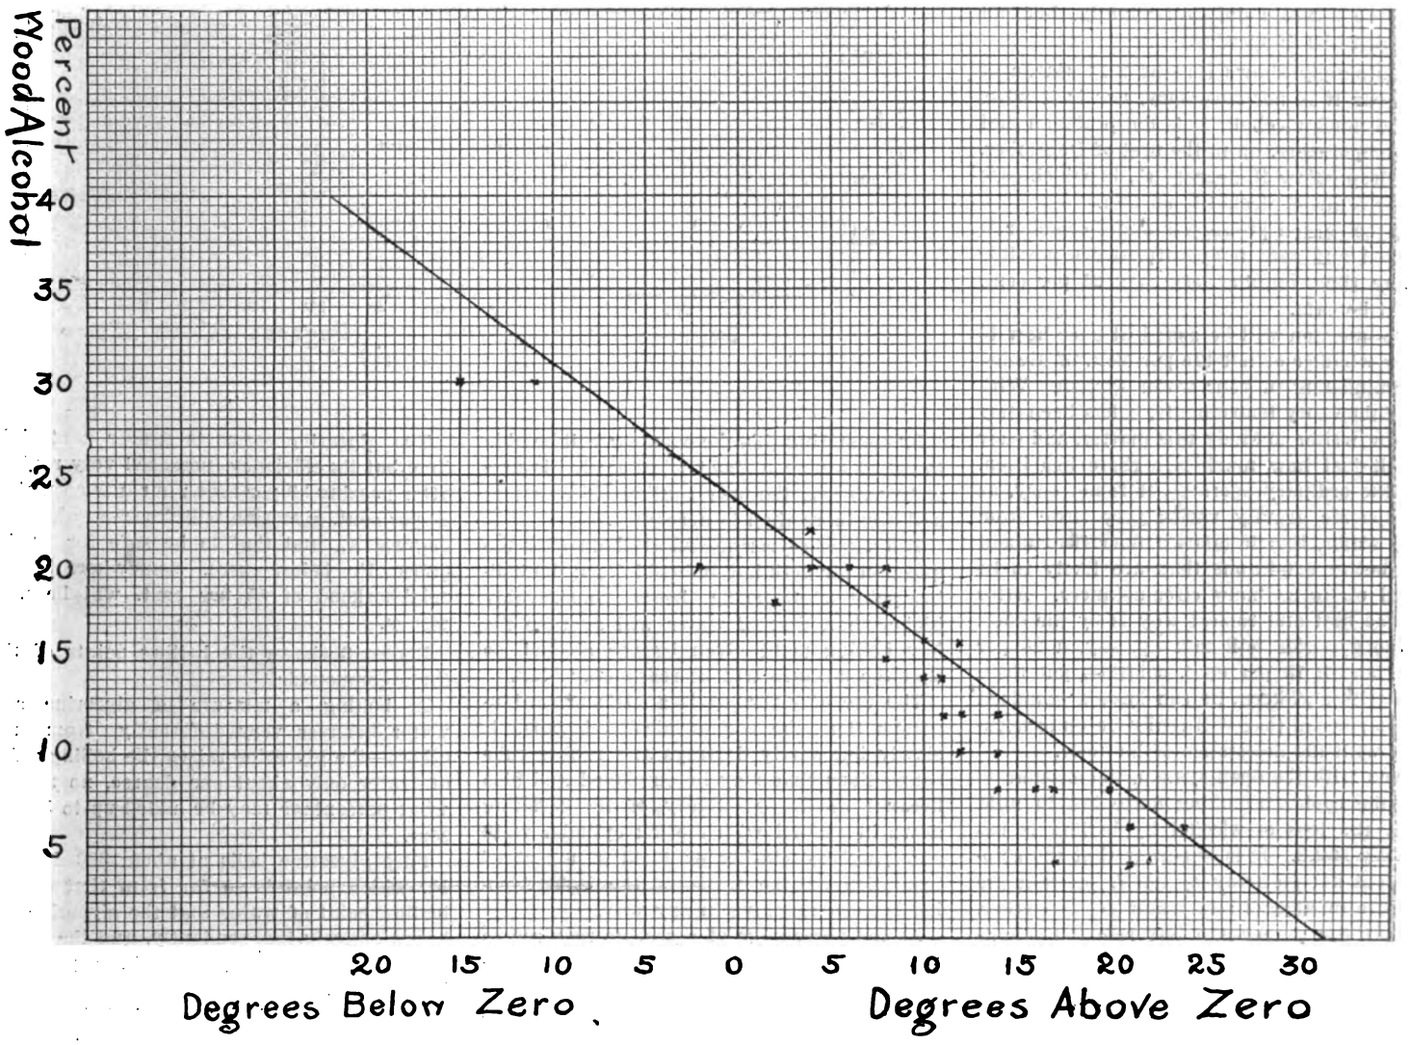

Fig. 1.

Digitized by Google

take a small bit of rubber tubing, fitting the end of the blow-off over the tube lightly. Any pressure that would injure the machine at all would blow this off and prevent injury.

Later in the season, when the temperature was as low as 15 degrees F. below zero, 33 per cent. of alcohol resisted freezing perfectly, even when the car was left out of doors over night.

During October, with the temperature around 50 degrees F. and 60 degrees F., I used 32 per cent. of alcohol, with a result that the mixture did boil slightly, but not enough to be dangerous.

This simply shows that at that season of the year it is not necessary, nor is it wise, to add much alcohol. It is not probable that the temperature, up to the first of December, will drop below 10 degrees F., in which case 15 per cent. of alcohol is enough.

As the season progresses and December is reached and zero temperatures are possible at any time, nothing less than 25 per cent. would be safe.

The question will be asked at once how to know whether or not the per cent. of alcohol is diminishing in your water system. With nice laboratory instruments, it has been easy for the writer to study this matter, and easy to tell just how much loss there has been. For the ordinary operator, it is not easy, as the specific gravity varies very little from pure water, and it takes a finer instrument and better conditions than are likely to be found under ordinary circumstances. After all, the best and easiest way is by the odor. If the operator will mix up, say, a 20 per cent. and a 10 per cent. solution, put them in bottles and keep, he can have a standard of comparison that will really be quite accurate, with the assistance of his nose.

Even with the open system, the circulation and the cooler becoming quite hot in mild days, the loss of alcohol by boiling is extremely small. It is apparent that the alcohol does not go away by itself, but that the mixture of alcohol and water goes together, so that the percentage left remains practically the same.

Simultaneous with this practical using test another freezing experiment was carried out.

A number of test tubes were made up containing varying percentages of alcohol all the way from 4 per cent. up to 30 per cent. in steps of 2 per cent. These were placed in a basket outside of a window in a very cold place, and in the basket also a maximum and minimum thermometer. At 7 o'clock each morning the tubes were examined and the highest percentage of alcohol frozen noted. The results from slow and natural freezing like this, and duplicating the conditions of actual use, were a little different from the artificial laboratory freezing experiments.

The results obtained are shown on the accompanying diagram, Figure 1. In drawing this curve I have been conservative, and the results possible are a little bit better than shown by the table.

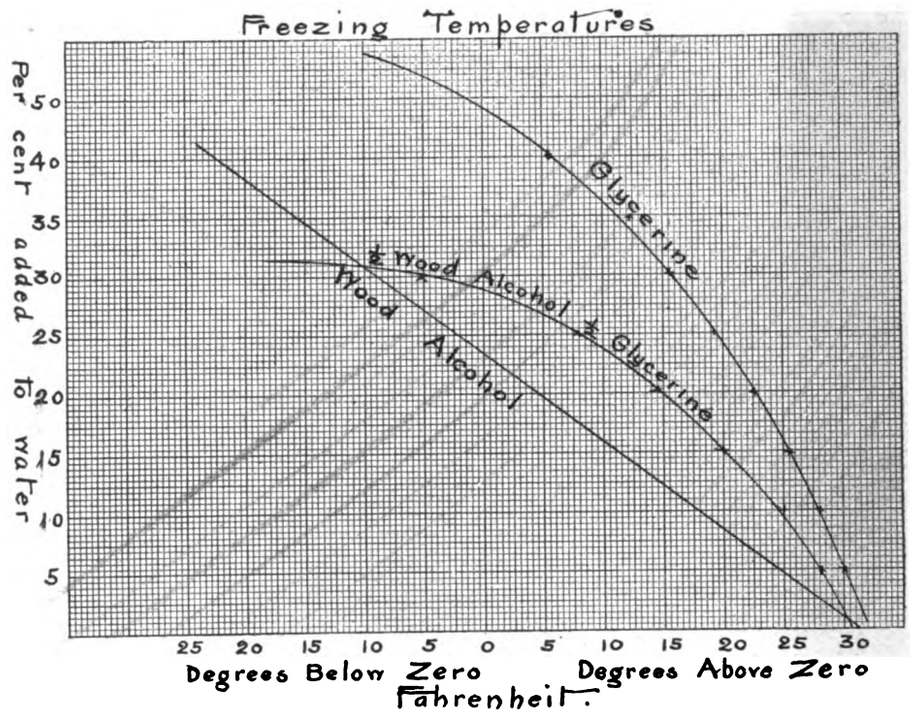

Fig. 2.

By consulting this the operator will be able to see at a glance about what alcohol is necessary to use, the only caution being not to add any more than is necessary.

The use of glycerine and alcohol solves the question for both hot and cold days; the boiling point of glycerine being considerably higher than that of water will average the low boiling point given by the alcohol, so that the mixture will be reasonably high.

The use of glycerine is a little more dangerous than the use of alcohol because it slowly but surely destroys any rubber tube connections that may be employed and also because of the possibility of its breaking down in contact with the hot cylinder wall, and partially closing or making a sort of insulation on the walls of the iron. Alcohol is not dangerous in any way.

As the percentage of glycerine required to meet a given temperature is very much larger than the percentage of alcohol required, and the cost is $2 a gallon, against 75 cents for wood alcohol, it occurred to me that a mixture of alcohol and glycerine would, perhaps, after all, meet all objections best, and this has been tried.

The accompanying diagram, Figure 2, shows the curves for the freezing of various percentages of wood alcohol added to water, a mixture of half alcohol and half glycerine added to water, and a mixture of pure glycerine added to water.

One peculiarity in these curves will be noticed at once; that the wood alcohol curve is nearly a straight line; that the efficiency of the wood alcohol and glycerine mixture in meeting freezing temperatures increases very rapidly with an increase of percentage, and at about 30 per cent. is quite as efficient as the wood alcohol alone. This mixture is practically good for 10 degrees below zero.

The glycerine curve is nearer a straight line, but its efficiency increased very rapidly after passing 30 per cent.; but it is seen that 30 per cent. glycerine will freeze at about 15 degrees F., and that to be safe for 10 degrees F. below zero, somewhere in the neighborhood of 55 per cent. will be necessary.

Figure 3 shows the boiling points of the three compounds.

In boiling, a mixture of glycerine and water behaves very differently from the others—the glycerine raises the boiling point of water only about one degree, no matter what percentage may be added up to 50 per cent.

Pure glycerine boils at about 330 degrees F., which point is so far from that of the boiling point of water that the glycerine behaves entirely independently, and the water boils, leaving the glycerine in a perfectly liquid state.

The mixture of half wood alcohol and half glycerine is decidedly better so far as boiling is concerned with the pure alcohol mixture.

From these results, it is seen that the half and half mixture with water is very good as far as freezing is concerned, and, also, fairly good as to boiling.

It, therefore, seems to me that if the half and half mixture is used, the operator will get the best results adding a small quantity of wood alcohol from time to time, as the weather gets colder, to reduce the freezing temperature. The glycerine will stay there all the time as a constant without loss, and insure against any moderate freezing temperatures.

If all glycerine is used, then a very large percentage is seen to be necessary. It is scarcely worth while to add less than 35 or

Digitized by Google

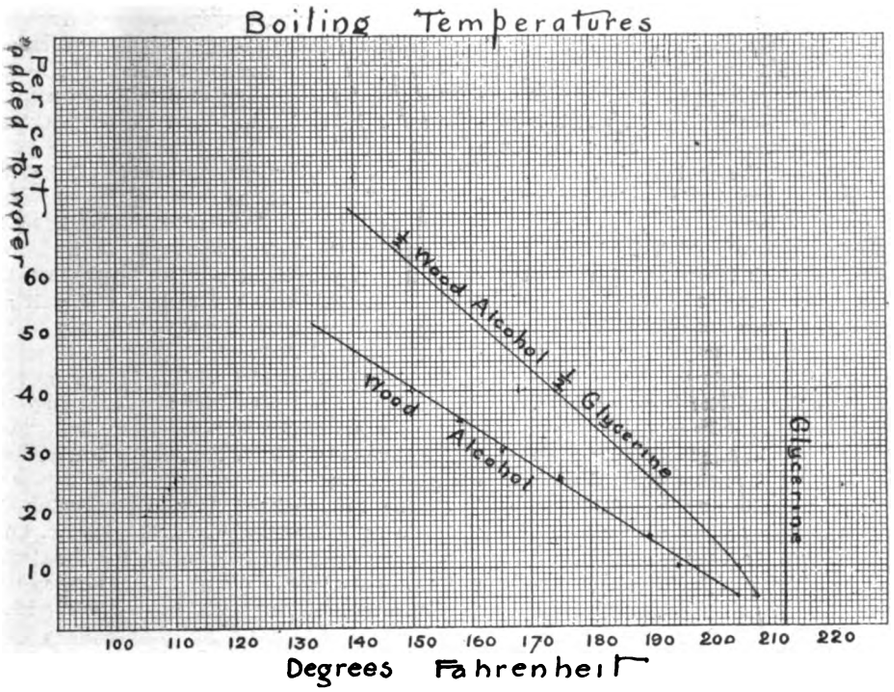

Fig. 3.

40 per cent., which will suffice for 5 degrees or 10 degrees F.

The right way to handle the mixture is to find out the equation for your own car, using all the alcohol you can possibly stand and not boil the mixtures on the mild days sure to be met with in winter in this clime. Some machines will stand all alcohol—that is, mixed with water—others will not. and glycerine must be used to keep up the boiling point.

Any number of chemical solutions are advertised in the market. It is quite possible that all of them will prevent freezing. I am not able to say to the contrary. One thing must be remembered, however, and that is every salt dissolved in water forms an electrolyte through which electric currents pass with the greatest readiness. Unless the entire system of water cooling surface is of exactly the same metal one or the other of the different metals is sure to dissolve. A cooling system may last a year or two, but sooner or later the leaks and other fatal results of electrolysis will be felt and some part of the system will disintegrate, the real cause of which rarely is suspected. These remarks apply to every chemical soluble in water that can possibly be used to advantage as far as lowering the freezing point is concerned. It is also a not unusual experience to discover that some of the anti-freezing chemicals have left a plasterlike deposit in the bottom of the tanks that finds it way into the pipes or tubes, and actually cakes therein.

If I sought to purchase a second hand car, one of the first questions I would ask would be, "Have you ever used in your cooler salt of any kind to prevent freezing?" Given an affirmative reply, I would not accept the car at any price.

There is certainly no reason, with these data before one, why a water cooled machine should not be run in any weather, and even left in a cold barn throughout the entire winter. It fairly may be said that the freezing problem is settled. HENRY SOUTHER.

Automobile Line for Jamaica

Kenneth A. Skinner, president of the Boston Automobile Dealers' Association, will shortly leave for Jamaica, West Indies, taking with him four or five touring cars. He intends establishing a passenger and baggage line on the island, and will work in conjunction with hotel men in Jamaica, who believe that there is a great field for the automobile as a means of transportation. The railroad facilities on the island are not of the best, and street railways are few and limited to the larger towns. To go to any other place requires the use of a slow carriage or a horse for horseback riding. The roads are excellent, being made of hand crushed limestone. They are smooth, fairly level and wide enough for ordinary purposes. Scattered over Jamaica are many delightful resorts, and on the west coast the climate is especially fine for invalids. To reach some of these resorts is, however, a very long and tedious journey by carriage or horseback. By automobile, it is reasoned, it could be made in a very short time and with much greater ease.

How the Parisians will Study.

It has been decided by the Paris Chamber of Commerce to include a course in practical automobile construction in the curriculum of the Ecole Supèrieure Pratique de Commerce et d'Industrie. The course will take the form of directed visits to various factories, the first of which recently occurred, when a group of fifty students drove to the Panhard factory in machines loaned for the occasion by the company.

ABOUT TWO-CYCLE ENGINES

The Principles that are Involved and the Far-reaching Results that are Sought.

In the development of the internal combustion motor common practice has at length, and after not a little experimentation along other lines, settled upon the sequence or cycle of events which is carried out in the most prevalent type of machine using what is known as the Bau De Rochas, or Otto cycle. The four steps which comprise this cycle are, first, induction of the charge of carburetted air; second, its compression to a tension of several atmospheres; third, its ignition and combustion, and fourth, the release and exhaustion of the waste products of combustion. In the true Otto cycle a complete stroke of the piston is devoted to each of these steps, thus necessitating the employment of four piston strokes, corresponding to two revolutions of the crank shaft, for the completion of one cycle.

In an effort to increase the number of working strokes in proportion to the number of revolutions of the crank shaft a motor was constructed many years ago in which there were two pistons, working in separate cylinders, the one fulfilling the offices of the first half of the cycle, and the other those of the second. That is to say, in one of the cylinders the charge was compressed, and from it was forced into the second, or working, cylinder when the piston of the latter was at the outer end of its stroke, only to be further compressed and ignited there in the usual way. From this arrangement the natural outgrowth was the two cycle motor of the present day, in which, instead of a pair of cylinders being employed, a single one equipped with a double acting piston is used. Thus in effect the four cycle principle is still maintained, one-half of the operation being accomplished on one side of the piston and the remainder on the other side, while its duration is reduced to two piston strokes.

Considering the action of the gases within the working, or power, end of the cylinder for a moment, the chief point of difference between this and the older type is at once apparent, for where in the first case one entire out stroke of the piston is devoted to the induction of the charge, and one entire in stroke is devoted to the expulsion of the burned gases, in the second every out stroke is a working stroke, and at least a portion of every in stroke must be devoted to the reception and compression of the fresh charge. Thus, in order properly to dispose of the exhaust, the working charge must evidently be relieved before it has had opportunity to expend the full measure of its effort, and the exhaust period must be terminated at some point during the in stroke.

Paradoxical as it may seem to the uninitiated, the two functions of exhaust and inlet are, in practice, carried on at one and the same time. Instead of this resulting in a confusion of the two elements, the burned and

Digitized by Google

unburned gases, as might supposedly be the result, this has a decidedly beneficial effect on the general action of the engine, as presently will be shown. Thus, in actual practice, the sequence of operation in the two cycle motor of the common type works out as follows: First, a charge is forced into the cylinder through a port which has been uncovered by the piston in its travel, or which has been opened by a valve. Under pressure from the crank case, and being further compressed by the upward motion of the piston, it is ignited at or near the point of reversal of the piston's motion. The subsequent combustion and expansion is carried out until the piston in its travel uncovers a port in the cylinder wall, permitting the gases to escape and immediately lowering the pressure within the cylinder. An instant later the piston, at or nearly at the end of its out stroke, uncovers a second port on the opposite side of the cylinder from the exhaust, and permits a second charge of fresh gas to be forced in. This in turn is compressed, ignited and exhausted in the same manner, and the cycle is repeated over and over again indfinitely.

To consider the action which goes on within the working end of the cylinder a little more closely, it is evident that even were the exhaust port of the same area as the piston, which is the ideal condition, the effect of the release could only be to reduce the pressure within the cylinder to that of the exhaust passage—that is to say, to reduce it to atmospheric pressure under ordinary conditions. It could not in any way be supposed to rid the cylinder of all of the waste gases. Thus, when the fresh charge is admitted, it must enter a cylinder filled with burned gases at atmospheric pressure, and were the exhaust to terminate with the admission of the fresh charge this remnant of the old charge would simply act as an inert dilutant of the new. In practice, however, the exhaust port is allowed to remain open for a time after the fresh charge is admitted, and the resulting effect is that the latter, instead of commingling with the former, tends to remain independent of it, and to force it out of the cylinder by the very intensity of its inrush. Thus the incoming gas, usually directed by deflector plates or vanes which are arranged to increase the natural tendency, swirls throughout the cylinder and cleans it of the greater portion of the useless contents, securing in this way what is called a scavenging effect.

Coming, then, to the duties of the compression end of the cylinder, it is evident that the action carried on there is, first, that of drawing in a charge of carburetted gas in suitable proportion, and then of compressing it upon the working stroke of the piston to sufficient degree so that upon the port to the working end of the cylinder being uncovered the gas will enter with a velocity which will serve to scavenge the cylinder and at th same time fill it with combustible vapor.

The habit which some two cycle motors have of "four cycling" has been the cause of considerable learned controversy, much of which has been not at all to the point. The real cause of the phenomenon undoubtedly is attributable solely to the reduction in the pressure of the incoming charge consequent upon throttling, governed in part by a considerably restricted exhaust port, which is provided in some motors in an effort to reduce the duration of the period of exhaust. In some measure as well this is also responsible for the back-firing propensities of such motors as do not use a high initial compression, and in which the uncovering of the inlet port simply serves to ignite the incoming charge either from contact with the incandescent exhaust, at the port, or from the latter forcing its way down toward the crank case against the inferior pressure there.

Concerning the merits of the two cycle motor, it is evident that, granting the possibility of completely exhausting the old charge in each case and of taking in a full charge of fresh gas, the power output would be nearly double that of the four cycle motor of the same dimensions. In practice, however, these two objects can only be approximated, how closely is not known, and the power developed is consequently restricted to a greater or less extent. In addition to this, the two cycle engine of one cylinder gives a turning moment which is precisely like that of a four cycle motor of two cylinders; the two cylinder, two cycle gives a turning moment equivalent to that of a four cylinder four cycle motor, and so on. Thus the torque of the two cycle motor is subject to only half the variations of that of the four cycle, and the power per pound weight, though not double that of the more common type, may be said to approximate it and to approach that value as a limit.

Of the comparative efficiencies of the two types but little is known in the way of authoritative data, except that the advantage up to the present time lies with the four cycle type. The greater thermal efficiency always will be to the credit of the four cycle type on account of its longer period of expansion and consequent increased use of the burning gases; but in motor car construction thermal efficiency plays but a comparatively insignificant role on account of the small total consumption, and so its consideration may be set aside, at least until such time as the introduction of very large units or a genuine threat of a fuel famine shall render a finer economy needful. But, on the other hand, disregarding questions of close theory, to increase the power of the motor without increasing its weight, even without increasing its cost proportionately, is something worth striving for, and if that gain is made without losing anything in flexibility or reliability or ease of regulaton of the motor, then the gain to the industry is very great. Also, the gain to the user is, roughly speaking, a gain of 100 per cent in power in practical efficiency and in all around utility.

The Reward for the "Rubber-neck."

"A reward will be paid for information leading to discovery of present whereabouts of three sightseeing automobiles, two with capacity of forty passengers each and terraced; one twenty-four passenger capacity; formerly operated by International Auto Sight Seeing Co.; manufactured by Vehicle Equipment Co. Send information to No. 27 Pine street, eleventh floor."

This advertisement appeared in all the New York City dailies one morning this week, but before it appeared several gum-shoed sleuths with Sherlock Holmes instincts had been sent to scour the country in search of the missing "rubberneck wagons," which, it appears, were leased about a year ago to the International Auto Sight Seeing Co. by the Vehicle Equipment Co. The lawyer on Pine street refused information; but that three immense cars of the sort could have been "lost" or have "strayed" or been stolen is a striking commentary.

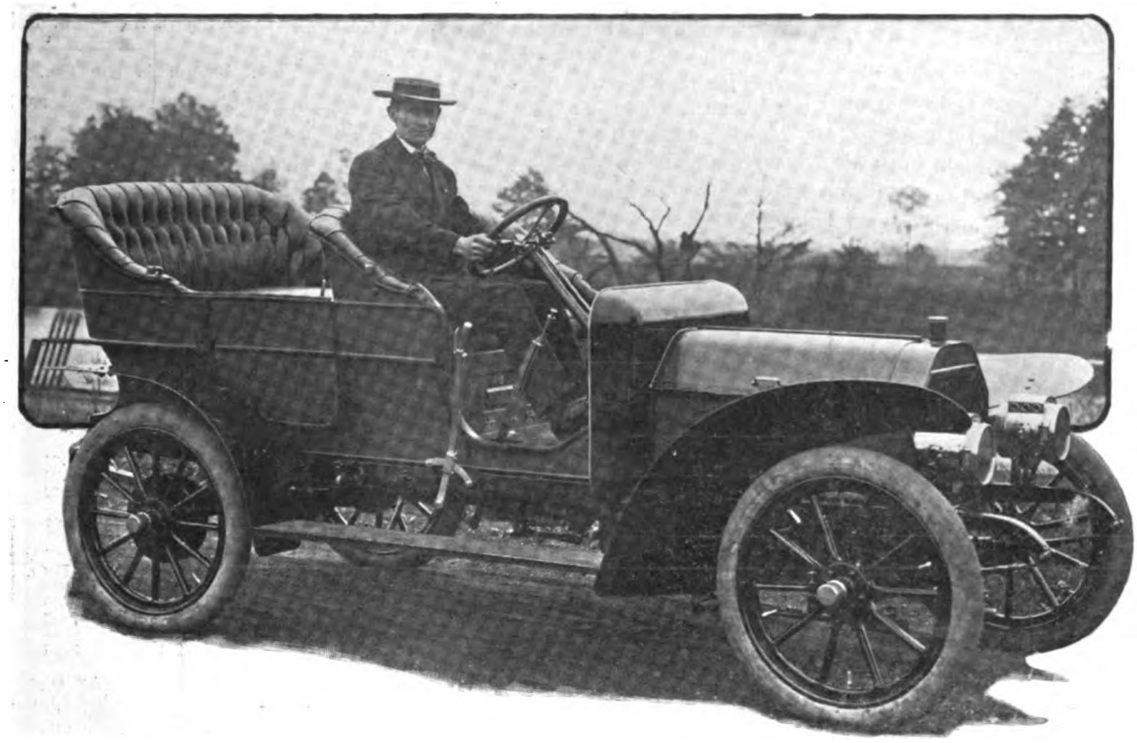
The International Auto Sight Seeing Co. appears in the telephone book with No. 1,404 Broadway as its address. This is the Casino Theatre, where it was said the other day that the auto company used to start its machines from that corner and sold tickets there.

"They had no offices here, however," it was said. "Perhaps it was next door."

At No. 1,402 it was said that that address had sometimes been given as the headquarters of the International Auto Sight Seeing Co., but that the concern had never rented offices. At No. 113 West Thirty-eighth street, to which the search for the missing "rubber bubbles" led, it was said by an elevator boy that the International Sight Seeing Co. had had an office on the second floor; that the concern had been managed by a Mr. Galvin and a Mr. Whitcomb, who was said to be connected with the Whitcomb Ticket Agency. It was said that Mr. Whitcomb had withdrawn from the concern and that shortly afterward Mr. Galvin's calls at the office became less frequent. After the smash of the International company's affairs most of the employes went over to the opposition company, which runs its sightseeing coaches from the Bartholdi.

At the New York Theatre, where the New York Coaching Co. has a stand, automobilemen in close touch with its affairs said that the International concern went out of business about six weeks ago.

One Cause of Lost Power.



Loss of power in a car is not always the result of as serious a cause as the inexperienced owner is wont to think. In many cases it comes from no more important source than the brakes which are binding, either from poor adjustment or because of a load of mud which has been thrown into them and which they are carrying, with consequent abrasion of their surfaces.

When the Burner Becomes Clogged.

When the burners of an acetylene lamp become clogged, an easy means of freeing them is to slip the tube of a tire pump over each in turn and blow out the impediment. It is a much more satisfactory method than to poke them out with a pin, and one which is not at all likely to injure the orifices.

Features of the First Four Cylinder Oldsmobile.

D. B. HUSS, IN THE NEW 4-CYLINDER OLDSMOBILE WHICH HE WILL EXHIBIT AT THE FOREIGN SHOWS.

If looks count, and there is no doubt of it, the new four cylinder Oldsmobile is due to obtain its full share of the count. It is a good looker and its construction is well thought out and well carried out. The front axle has been placed well forward under the radiator, giving a wheel base of 106 inches. The standard tread is 55 inches; either 52 inches or 58 inches will be furnished to order. The general design of the car is such that the tendency to stir up dust when running is very small. Weight of car, 2,200 pounds. Price $2,250.

The car is equipped with a four-cylinder vertical water cooled motor, developing 24 to 26 horse power. Cylinders, 4½ inch bore by 4¾ inch stroke. Pistons are carefully grounded, and "run in" with a belt to insure accurate fit.

The valves are mechanically operated and easily adjusted. The fly wheel is carefully marked, and an index is placed on the crank case so that the valves may be quickly and accurately timed. All bearings are of generous proportion, and quarter boxes are of babbitt lined bronze. The cylinders are cooled by means of water circulated by a gear pump. The radiator used is one of special design, using a flat tube construction. A fan placed just behind the radiator aids in cooling the motor when the machine is standing still.

The crank case is of aluminum. The lower half may be removed without disturbing the bearings, which are hung from the upper half of the case. The crank shaft, connecting rods and pistons, can, therefore, be very easily examined or removed without disturbing the hanging of the motor.

A pressed steel frame of channel section is used. In addition to the main frame, a sub-frame is provided which supports the motor and radiator. A portion of the dust pan which runs under the car, is riveted between the outside and inside members, and gives a pronounced bracing effect. A portion of the dust pan is removable, so that the motor may be very easily examined, yet at the same time it is firmly fastened when in place and absolutely prevents the dust, mud and water from reaching the working parts of the mechanism. Both engine and transmission are aligned upon the sub-frame, and all working parts may be removed without disturbing the hanging of the crank or transmission cases.

The transmission is of the sliding gear type having three speeds forward and one reverse. All of the gears are made of special high carbon steel, tempered and hardened. The control is of the selective type, all changes being made with one lever.

The clutch is of the ordinary "dish pan" or cone type, and is provided with a simple spring device whereby the load may be thrown onto the motor gradually, thus doing away with any jerking motion when starting. The clutch may be thrown out by foot lever, and also by emergency brake lever.

Steering is accomplished through a worm and nut mechanism. The nut has a large wearing surface so babbitted that same may be easily replaced at any time. The spark and throttle levers are placed upon the steering post, and just beneath and at the right hand side of a 16-inch oval rim steering wheel. An accelerator pedal is also arranged in such a way that it may be used with ease when it is desired to instantly increase the speed for a short interval.

There are two brakes; one, operated by a pedal control, acting on the cardan shaft, just back of the transmission case; the other, operated by a hand lever, which "sets up" the emergency toggle joint brake upon the rear wheels. Application of this latter brake throws out clutch, disconnecting transmission from motor.

The front axle is of Olds special design, and is built of 2-inch tubing, having a ¼ inch wall. There are special large bearings upon steering connections, all these bearings being equipped with "T" handled grease cups, and protected by leather dust caps. The steering connections and gear links are adjustable so that the wheels may be easily lined up at any time. Axle is dropped in center to protect the fly wheel and other parts beneath the car. The gear axle is equipped with Timken roller bearings throughout.

Bevel gear drive is used, having a ratio of 3 to 1. Ratio of 3½ to 1 or 4 to 1 may be furnished on special order.

Large, half elliptical springs made of the best stock obtainable are used, the front being 36 inches long, and rear 48 inches.

The wheels have 10 spokes in front, and 12 in the rear, and are equipped with 32 inch by 3½ inch tires. Four inch tires for extraordinary service can be had on special order. Running board and mud guard irons instead of being riveted on are drawn into taper sockets upon side members of frame and are easily removable.

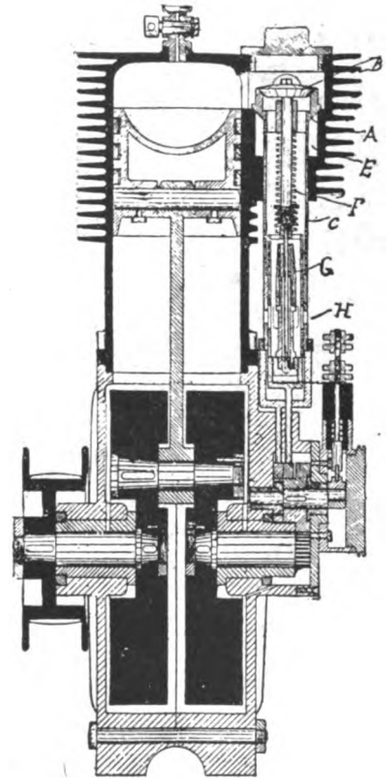
STRIVING FOR COMPACTNESS

In the Effort, these Germans Evolve Novel Arrangement of Valves and Carburetter.



A point which has been considerably discussed among gas engine builders is that of the relative arrangement of the inlet and exhaust valves. By some it is thought to be of great value to have the two ports placed in such close proximity to one another that each will receive a measure of effect from the other. That is to say, the heat of the exhaust valve is supposed to have a good effect upon the carburation of the incoming gases, while, on the other hand, the inrush of the cool, fresh gas of the new charge will tend to lower the temperature of the exhaust valve, thereby prolonging its life. Others claim that despite the benefits to be derived from this arrangement the carburation can as well be effected in the carburetter alone, and that the heat in the vicinity of the inlet to the cylinder tends so to increase the volume of the incoming gas that the power of the explosion will be measurably weakened.

Whatever may be the rights of the case, common practice still shows more or less divergence on this point, and many constructors, particularly those who are making small motors, still adhere to the practice of placing the two ports in close proximity. Among these is a firm of German manufacturers which has revived the practice at one time suggested, if not actually carried into effect, of placing the inlet within the exhaust, thereby obtaining the maximum possible effect. In this particular motor a distinctive novelty is introduced in that the carburetter is carried within the hollow stem of the exhaust valve, thereby rendering it an integral part of the motor instead of retaining it as a more or less detached auxiliary. The motor is especially designed for motor bicycle work, but its susceptibility to multiple-unit construction and its compactness would seem to recommend it to the consideration of the builder of light cars.

As shown in the accompanying cross-section, the exhaust valve, instead of comprising a body portion attached to a stem of small diameter, is arranged in the form of an annular ring surrounding a hollow tube. This is actuated and timed in the usual manner, by a cam driven by the two-to-one shaft. It is held down upon its seat by means of two springs fixed to a yoke at the side of the tubular stem C.

The seat of the inlet valve is carried in the valve A, and the valve itself, which is of the suction, or automatic, type, is held to its normal position by the spring F, which surrounds its stem. The carburetter, which is of the spray type, and fed without float chamber regulation, is located within the hollow of the exhaust valve and at its lower end. The feed is through the spray nozzle G, which is fed from a pipe outside, which is not shown. The regulation of the jet is accomplished by means of a needle valve, which is actuated by the inlet valve itself in synchronism with the cycle of the motor, so that the fuel flows only during the period of the inlet. The air intake is through the holes H.

By this means the makers have secured a very compactly designed motor, and as well have taken advantage of the opportunity to increase the radiating surface by surrounding

the single valve chamber with an additional number of radiating flanges. While the arrangement of the valves might be open to the objection of complexity, it is yet perfectly evident that the entire mechanism is confined to the one organ of distribution, and that on this account there should be less chance of its getting out of order than in a case where several sets of gears and valves are used.

Lignum Vitæ for Brake Blocks.

A novel experiment is being tried by a New York motorist, who has equipped the brakes of his car with lignum vitæ bearing blocks instead of leather or composition. The great difficulty with brakes which otherwise are well designed is that of the inordinate wear of their friction surfaces, it being a natural conclusion that the best holding brake also will prove the fastest in wearing out. For many years lignum vitæ has been used for bearings in certain classes of mill practice, where it has stood the test of time with remarkable success. In the present instance it is said that the result is even more satisfactory than was to be expected under the circumstances.

COST OF PARCEL CARRYING

Big Department Store Submit Figures Showing Economy of the Motor Delivery Wagon.

The Joseph Horne Co., owners of Pittsburg's big department store, have contributed some valuable figures to the fund of commercial vehicle development. From July 11 to October 1 last they used an Oldsmobile delivery wagon on sixty-five days, their carefully kept record of the cost of operation for that period being about as follows:

1905	Cost of Material.	Factory Chrgs at 50c an hour.	Mach. Oil at 11c gal.	Eng. Oil at 11c gal.	Gasoline at 10c gal.	Total.
July ...	.55	7.00	.22	.92	11.27	20.56
Aug. .	3.05	2.75	.22	.92	14.49	21.43
Sept. ...	3.92	4.62	.22	1.16	17.22	27.14
	7.52	14.37	.66	3.00	42.99	69.13

	Packages Delivered	Miles Run.	Trips.	Trips Lost
July	2,772	468	33	0
Aug.	2,276	715	47	0
Sept.	3,156	633	50	0
	8,204	1,816	130	0

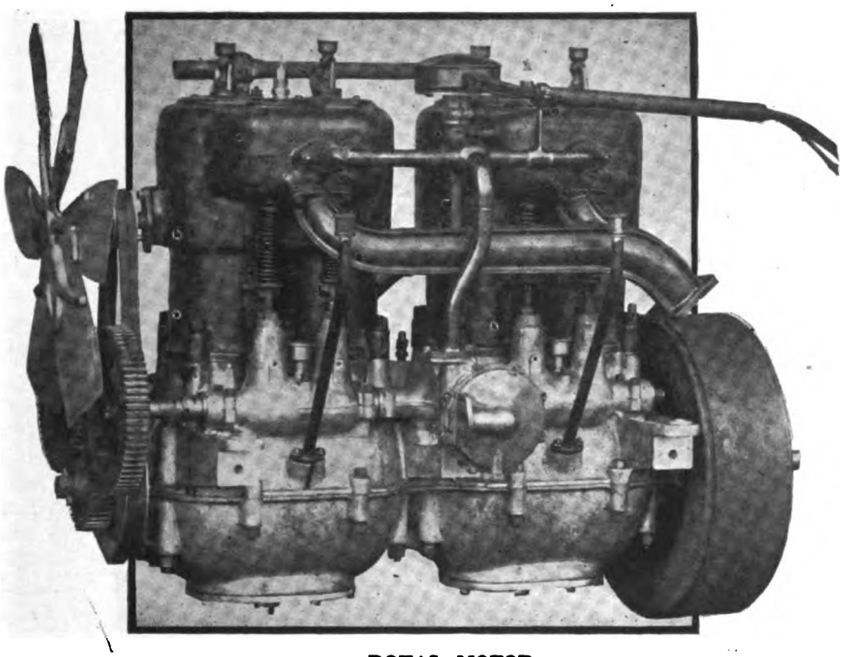
	Av. cost per pkg.	Av. cost per mile.	Av. cost per trip
July	.0074	.044	.6230
Aug.	.0094½	.030	.4560
Sept.	.0086	.043	.5430

Average cost per package..... .0084½
Average cost per mile ..... .0380
Average cost per trip ..... .5320
Average cost per day 1.0640

Although in August the machine covered more miles than in September or July, and yet delivered less packages, this was due to the fact that twice a week it was used on different routes, usually to the furthest outlying ones, which are not so heavy in packages as in mileage. The car also covered the hilliest route with success, having at no time refused to take any and all grades on any and all routes.

Three Trucks to Replace 72 Mules.

One of the most significant applications of the automobile to commercial uses which has yet been made is in the substitution of three one and one-half ton motor trucks for a service which hitherto has been performed by seventy-two pack mules. For this purpose the Packard Motor Car Company recent made shipment of three of its standard trucks to Central America, where they will be used in the service of the New York and Honduras Rosario Mining Company, in the transportation of gold and silver concentrates from its mines near Tegucigalpa, the capital of Honduras, to San Lorenzo, on the Pacific Coast.



At present the work is carried on by means of pack mules, each animal carrying an average load of 250 pounds, which is equally divided in two packs. The mules require about six days to cover the distance of ninety miles. The normal carrying capacity of each of the motor trucks is 3,000 pounds, and the most conservative estimate easily places the time consumed in making the journey in one day. This will be made possible by the good condition of the road on which the government of Honduras has spent over a million dollars during the last five years.

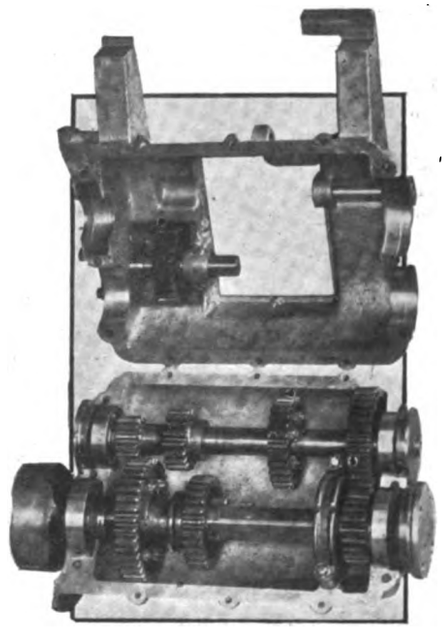
REGARDING THE NEW ROYAL

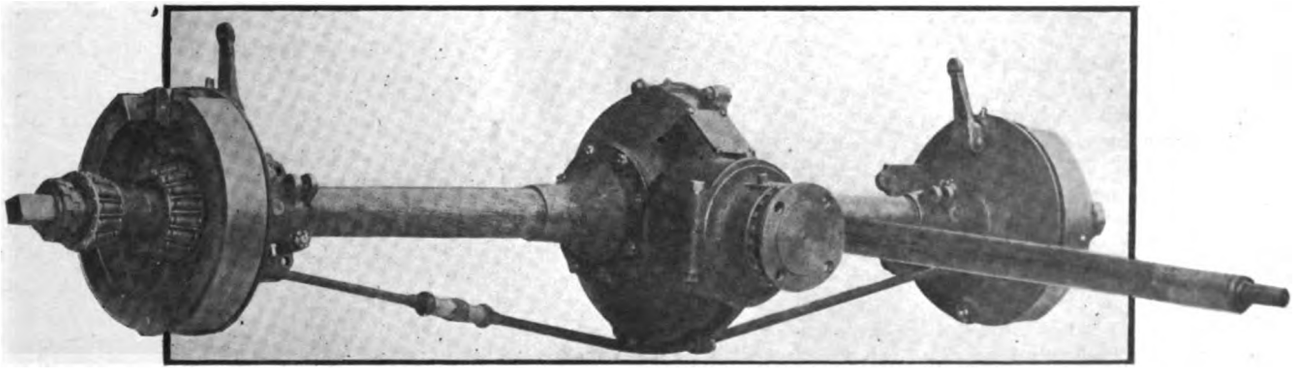
Characteristics of the 1906 Model that Will Render its Position Secure.



In making up the designs for their 1906 car the Royal Motor Car Company, of Cleveland, Ohio, have wisely concluded to build upon the splendid reputation of this year's work, and not to make changes merely for the sake of change. Accordingly the new model is of the four cylinder pattern, of 40 horse-power motor, of regular design, set in a steel chassis, with 110-inch wheel base. The method of control is of the simple order which is characteristic of all the new cars this year, and the mechanical parts throughout are of heavy and ample size and strength. The standard body is of the King of Belgium type, with wide side doors and roomy seating capacity. Ample storage space is provided, both for luggage and spare parts, and the tank capacity for fuel, which is 22 gallons, is sufficient for a two hundred and fifty mile trip.

ROYAL MOTOR.

An important feature in the design of the motor is that the unit type of construction is used, all auxiliaries except the coils and lubricator being mounted directly on the base, thus permitting the removal of the power plant from the chassis without disturbing the adjustment of any of the vital parts. The cylinders, which are cast in pairs, are 5 by 5½ inches bore and stroke, and have the inlet and exhaust ports oppositely disposed, the valves being interchangeable. The spark plugs are placed over the inlet valves and the commutator is mounted on a vertical shaft which lies between the two sets of cylinders, thus permitting of simple and accessible wiring. All bearings, with the exception of those on the wrist pin ends of the connecting rods, are of bronze, while the latter are of hardened steel. The crank shaft is drop forged with ground bearings. All wearing parts on the cam shafts are carbonized and hardened, the shafts being driven by fibre gears external to the case.

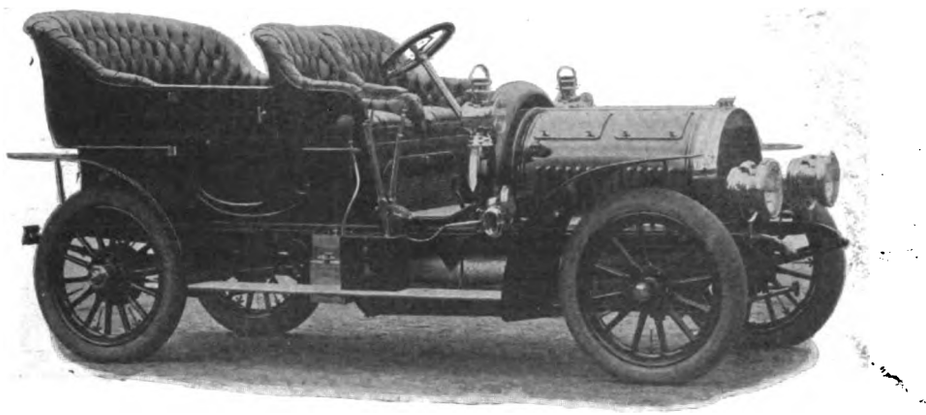


The water circulation to the radiator is effected by means of a gear driven pump having hardened steel gears and shaft. The fan and its mechanism are carried entirely on the motor. The carburetter differs from that used in last year's model in that the jacket instead of enclosing simply the mixing chamber, extends over the entire mixing and throttling chambers, the jacket water being used for heating instead of the exhaust gases.

ROYAL GEARS.

The crank shaft is flanged at the rear end to take on the fly wheel, which is of generous proportions and turned out to receeive the leather-faced cone clutch.

Between the clutch and the transmission a full universal joint is placed to allow for any possible disalignment of the machine, and to facilitate dismounting. The transmission, which is of the orthodox three-speed type, is built on the same general lines as were used in last year's car, except that ball bearings are used on both driving and lay shafts. The gears, which are specially treated, are bolted to flanges, which are made integral with the shafts and are characterized by large pitch and long faces. The lay shaft runs continuously, but at slow speed. The changes are obtained by a simple mechanism, there being but a single sliding member,



ROYAL REAR AXLE CONSTRUCTION.

Digitized by Google

which locks with the driving shaft for direct drive.

The final drive is by a propeller shaft, having hardened joints throughout. The rear axle, which is mounted in roller bearings, has the good point of taking its load on the stationary tube instead of on the moving parts, thereby relieving the latter from all strains other than those of driving. The front axle also is tubular, of heavy construction, and the front wheels are mounted on roller bearings similar to those used in the rear.

The steering gear is of the ordinary and thoroughly approved worm and segment type, with hardened bearing surfaces, and all levers and other portions of the control mechanism

1906 ROYAL TOURING CAR.

are either bolted or fastened by means of squared ends, to forestall any possibility of their working loose. The frame is of pressed steel, braced to give the required staunchness and strength, and the spring hangers are drop forgings.

The positive pressure feed oiler and the spark coil are mounted on the dash, which is cast in aluminum with the necessary lugs fashioned into it. The radiator is of the well-known cellular pattern and is of so great capacity that the engine can be run with it only half filled without over-heating. In general appearance the machine is strong looking, elegant and thoroughly American.

Two-Cycle Car from the Coast.

It is so rare that a car of Pacific Coast origin reaches the East that the recent appearance in these parts of the Sunset automobile was almost in the nature of an event. During the past year a number of them have been made by the Sunset Automobile Company of San Francisco, and they have behaved so well in that hilly country that several visitors induced the inventor to bring one of the cars to the East with a view to its manufacture here. They consider it a revelation in the two-cycle type and a Motor World man who was given a short ride in it can vouch for it that its action—its smoothness and its silence—left nothing to be desired.

The motor, which is the particularly novel feature of the car, is of the two-cylinder type, with cylinders 3½ by 4 inches, and develops 10 horsepower running at its normal speed. The peculiar feature in its construction upon which the makers base their claim that it will run under all conditions of load and speed without skipping or slowing back is that the ports are made extraordinarily large and are so arranged that a considerable port opening is acquired with but a comparatively slight amount of piston travel, whereby the point of release is considerably delayed without the gases being throttled in the least degree.

The cylinders are copper jacketed, the jackets being held in place at the bottom by means of an iron ring, shrunk in place and at the top, by means of a collar, screwed in place, and seating against the top of the cylinder casting, the latter being tapped out to receive the spark plugs. The general make-up of the motor is extremely simple, there being no moving parts except the piston group, the automatic valves set in the bifurcated induction pipe and the commutator handily mounted at the front of the machine. The fuel is vaporized and mixed in a single-Sherwood carburetter, which is one of the few stock parts used on the machine.

Ignition is accomplished by means of the ordinary jump spark system, but a single coil being used in conjunction with an original high tension distributor. The circulation of the cooling water is accomplished by the thermo-syphon system, so that except for the radiator fan, the motor is entirely without auxiliaries.

A planetary transmission is employed, which gives two forward speeds and a reverse, the entire control being vested in a single lever at the right of the driver's seat, which actuates a sliding double cone, which in turn raises successively each of three fingers, which serve to apply the bands for the low speed and reverse and the clutch for the high speed. As the spark control and gas levers are mounted on the steering column and the brakes, of which there are two, are both operated by pedals, the manipulation of the car is exceedingly simple.

The wheel base is very long, considering the size of the machine, being 84 inches, while the weight is but 900 pounds.

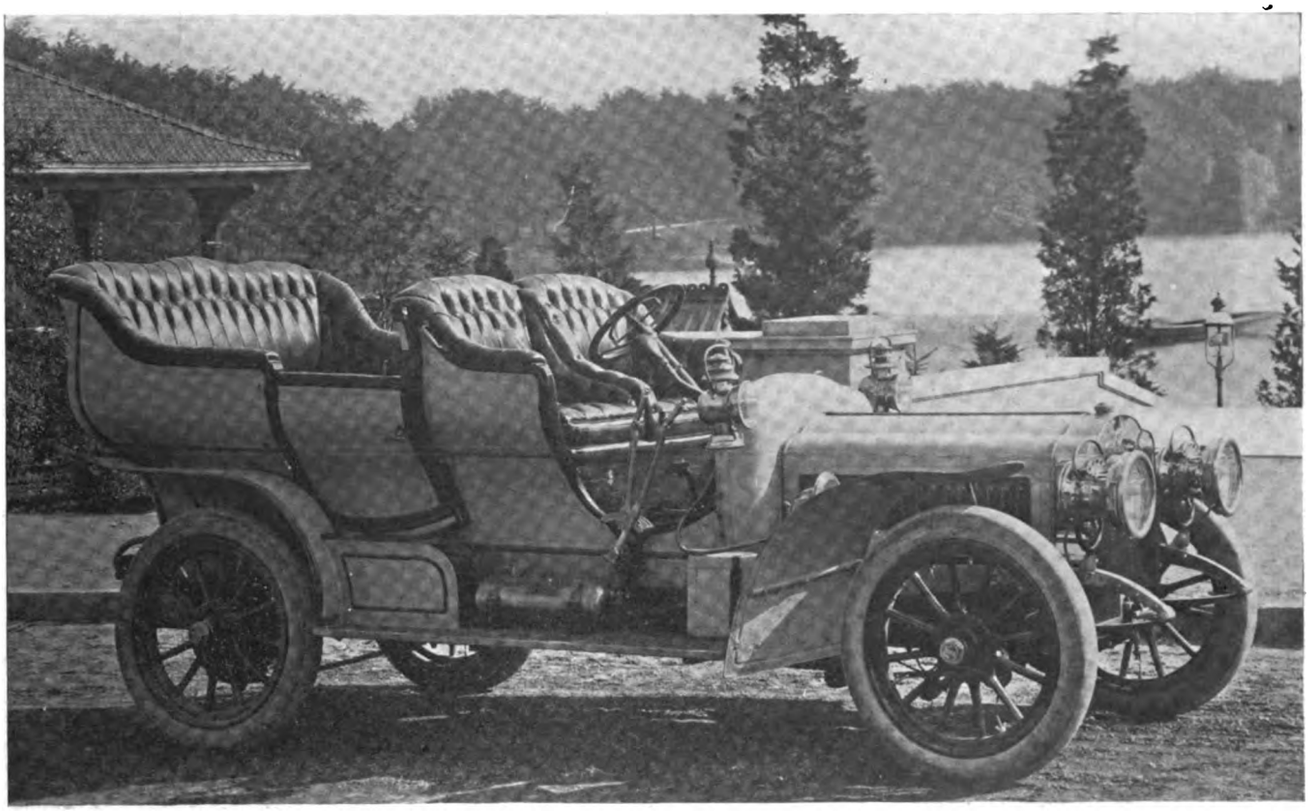
The body is of the runabout, or cross country type, with a long boot behind the seat. At the option of the user, however, a second seat may be added, which, being quite similar to the other, gives the machine the appearance of a surrey.

The makers of this car, which has found a ready market in its home State during the last year and a half, are putting it out at the remarkably low figure of $750. At present a representative is showing a demonstrating car to some interested people in the East, which may result in its introduction in this part of the country.

First 1906 Haynes Reaches New York.

The remark let fall by one of them: "I guess the Haynes Company have got it this year all right," about sums up the verdict on the 1906 Haynes car rendered by the New York sharps who had a chance to see it and in it on its appearance in this city this week, after being run over 4,000 miles by John Haynes, who was in no small degree responsible for its creation, and which included a trip over the road from Kokomo to New York City and through New England to Boston.

It has been Mr. Haynes's idea to subject the car to the widest variety of conditions, and find out what points, if any, fell short of the standard set. The "finding out" trip included stops at Toledo, Cleveland, Buffalo, Rochester, Syracuse, Utica and the intermediate town along the Mohawk Valley and down the Hudson to New York. Agents in all of the cities visited have had an opportunity to examine it and see it demonstrated and the results have been more than gratifying.



The new Haynes car at first glance gives an impression of immense power, and this impression is more than borne out by its performance. In a demonstration on Tuesday of this week, Mr. Haynes, in company with Manager F. G. Carrie, of the New York branch, sent the car over some of the worst hills and roughest roads of this vicinity in a manner that left nothing to be desired. For all its power, it is extremely flexible and the operation of the Haynes patented transmission is a revelation, the speed changes being effected with absolutely no noise and the motor picking up the work with no jerk or perceptible effort whatever. The spring suspension is good, the car riding very easily, and in short, it is a product of which the pioneer American automobile manufacturer well may be proud.

That New Yorkers are quick to realize its value is shown by the fact that orders for two cars were placed before it had been in the city scarcely long enough for them to make its acquaintance.

F. J. Wharton, of Sharon, Ohio, has purchased two 35 horsepower cars, each having a seating capacity of twelve passengers, which he proposes to operate between that town and Mercer on a three trip a day schedule. He is charging $1.25 per passenger per trip.

How the Thomas Flyer has been Improved.

In the 1906 Thomas Flyer, which is catalogued as Model 31, there are enough of new features to make it deserving of the caption "new car," yet enough of the sterling marks of its predecessors to make it one of a well known type rather than the beginning of a new line. Of the new features which have been adopted in Model 31, the lengthening of the wheel base from 104 and 110 inches, to 118 inches, with consequent lengthening of the body and extension of the springs to provide the necessarily added elasticity to the suspension, is the most noticeable, and this, taken together with the rounding off of the corners, and lowering of the back of the rear seat, of the otherwise unaltered body, gives the machine a rangey appearance which is decidedly advantageous. Among the more essentially mechanical details which are named, may be cited the trussed frame, the sub-frame being abandoned, drop forged axles of I-beam section, increased radiating surface, special form of disc clutch, and improved transmission.

The motor which is rated at 50 horse power, is of the common type, having four independently cast cylinders of 5½ by 5½ inches bore and stroke, with jackets made integral. The valves are oppositely placed, and are mechanically operated, the suction type of admission valve heretofore used, having been abandoned. The pistons, which are packed with five eccentric rings, are scored with oil grooves which serve to distribute the lubricant which is supplied through individual feeds from the multiple oiler. The connecting rods are nickle steel forgings, and the crank shaft is a drop forging, seated in five plain bearings lubricated by chain oilers. The cam shafts are driven by external gears of combined fibre and brass structure, running under protecting shields, the shafts and cams themselves being entirely enclosed.

The jump spark system of ignition is retained, the distribution being accomplished by means of a dash board commutator as formerly, though a change in the method of wiring furnishes a considerable improvement in that system. Special provision also is made for the installation of any approved form of magneto ignition at the option of the purchaser. An automatic carburetter is provided which is regulated from the steering column, and also is automatically throttled on the withdrawal of the clutch or application of the brakes.

In the clutch, which is of the metal to metal type, fitted with a single driving disc, special provision is made for the free movement of the driving shaft when the organ is disengaged, an auxilliary thrust bearing being arranged to take up the strain of the spring, when the driving pedal is depressed. The driven member of the clutch is of manganese bronze, packed with cork cushions which are introduced in recesses for the purpose of easing the starting load. The two driving members are of cast grey iron. In the transmission, which is supplied with four forward speeds in the new model, Hess-Bright bearings are used at all points except at the forward end of the main shaft where a roller bearing is used. The gears are made with considerably wider face than formerly, 1¼ inch being the new dimension as against ⅞ inch in the other types. The changes of gear are obtained by means of the selective system, two sliding sets being used, actuated by a single lever moving over a gridiron segment. In the differential, which is enclosed in the gear case, an improvement has been made by the introduction of a new set of pinions, thereby considerably increasing the strength of the member.

The double chain drive is still retained, and so too, is the safety device, or ratchet sprag, which is dropped into action by a small lever at the right of the driver. Of brakes, there are four, one pair acting upon the outside, of a pair of drums attached to the rear wheels, and the other, being of the internal expanding type, acting within the same drums. One pair, those acting internally, are actuated by a foot pedal, while the others are applied by the emergency lever, which also applies the first set as well, and withdraws the clutch. Both brakes are interconnected with the clutch, as this would imply, and this feature, coupled with the method of interlocking the gears and throttling the motor upon the withdrawal of the clutch, makes the "fool proofing" element particularly strong.

SOMETHING FOR EVERYONE

Reo 'Bus Gets Chief Award but all other Economy Testers Obtain Souvenirs.

As was expected, honors in the what was intended to be a national economy test promoted by the New York Motor Club were generously distributed. The awards were made public by the contest committee on Thursday of last week. Of the seven prizes three were won by the Reo omnibus, driven by R. I. Lockwood; two by the Reo runabout, driven by C. C. Singer; one by the Compound, driven by F. C. Carter, and one by the Marmon, driven by A. Largensen.

The "national" trophy for the most economical showing per passenger was given to the Reo bus, its per capita rate for the six days being $2.93. The same vehicle also won the trophy for the best showing per capita, including tire changes, with an average cost per mile of a little over 4 mills. The bus also was given another prize for consuming the least amount of gasolene. It was charged with $16 worth, and as it carried ten souls, the average cost was reduced to $1.60.

For having the least ignition trouble the Reo runabout was presented with a prize donated by A. L. McMurtry. The runabout claimed a perfect score on this point which was not disputed. This car also won the gold medal for the best showing in Classes A and B for vehicles selling under $1,500. The per capita cost, with four passengers carried, was $3.38. The silver medal in this class was given to the Compound car, driven by Carter, with a rate of $3.72.

In classes C and D, for cars selling between $1,500 and $3,500, the Reo bus naturally made the best showing, but the committee had doubtless foreseen the outcome and had prepared itself by ruling that any car that won the "national" trophy would be ineligible to any of the other class prizes. Therefore the club saved one of its medals. The second prize, in consequence, goes to the Marmon, with an average of $4.58.

As the Oldsmobile, the Wayne and the other Compound were presented with certificates of "honorable mention," every car that finished the test figures in the awards. Thus everybody was pleased, especially the officials who have announced that the test proved such a success that it would be made an annual affair.

The detailed tables of the performance of each car are said to be completed, but for some reason or other, are being held back.

Treat Him Squarely, Says McClintock.

"The best way to treat the overspeeding automobile driver is to use him squarely—to treat him in a manner above board," said Highway Commissioner W. E. McClintock, of Chelsea, at a meeting of the road builders of Massachusetts held in Brockton last week. "If those who try to regulate overspeeding would do so openly and squarely I am sure much better results would be obtained.

"There is some doubt as to whether the speed law is to be interpreted literally. In many places where the limit of speeding is low it is practically impossible for an automobile driver to keep his machine down. There are few automobile drivers who have not at some time exceed the speed limit. In some places the authorities recognize this difficulty of keeping down to eight or ten miles an hour and do not trouble the drivers, provided they are not going at reckless speed and seem to have in mind the welfare and safety of others. In other places we see just the opposite. There are officials in wait at every turn, stopwatch in hand, trying to get the machines going even a fraction of a second above the time limit, even though there is no danger to passersby, teams or pedestrians.

"There is a question as to which method is better. I do not believe in this lying in ambush, hiding behind hedges and trees and the sudden swooping down of an official on an automobile driver. I believe the best way is the open way. Treat the automobile driver as a man and he will treat you as a man. Let him know you mean business and mean to enforce the law, and if you go about it in the right way, in nine cases out of ten he will see that you are trying to do your duty to the best of your ability, he will understand things from your point of view, he will fall in with the idea and he will not only try to assist you in the enforcement of the law, but he will help others enforce it in other places.

"It is often the most careful driver that gets arrested for overspeeding, and the most reckless often get away. As a rule, the reckless driver will do everything possible to escape arrest; he will take long chances, and if he sees capture staring him in the face will put on speed and will get away if possible.

"One thing of importance seems to be lost sight of. Overspeeding is not necessarily reckless driving. Ordinarily when the machine is going over the speed limit it is not going so fast but that it is under perfect control. There are exceptions, of course, but I am talking of the ordinary case of overspeeding, such as often gets into the courts. But the law sets limits for the driving of machines, and the law must be enforced.

"The overspeeding trouble will undoubtedly work itself out. There should be harmonious efforts. The authorities should see the rights of the autoists and the autoists should see the rights of the authorities and public. If they work together everything will probably be straightened out much more quickly than if there are enmity and discord and an effort to push things without the proper investigation into the matter."

Club Will Not Conduct Eagle Rock Climb.

Although several papers have conspicuously heralded that the New Jersey Automobile and Motor Club would promote this year's Eagle Rock hill climbing contest on Thanksgiving Day, an official of the club stated positively to the Motor World that the club would not at this late hour promote or, in fact, have anything to do with any contest that may be held. The newspaper announcements, it appears, grow out of the efforts of W. J. Morgan, a professional promoter, who lives near the hill and holds a card of membership in the club, to secure entries for an event of the sort.

RED DEVILS NOT SO WARM

Frost Falls on their Twice-Postponed Racemeet and Despite a Ladies Race, too.

After two postponements, the lame excuse being adverse weather and poor track conditions, the race meet at St. Louis, Mo., promoted by the self-styled "Red Devil Automobile Club," was finally run off at the fair grounds track in that city, Saturday, 11th inst.

Although everywhere else in St. Louis the weather was ideal, a heavy mantle of frost settled over the track early in the meet, and before the last event was run off most of the spectators seemed to be shivering from the cold. In fact, the only interesting events were a five mile for motorcycles and an impromptu three mile event for bicycles which was gotten up after the automobile race meet to save the day.

The first event, a three mile novelty race, with four entries, was speedily dispatched with, owing to lack of starters. Then followed a five mile open for motor cycles, which brought out a field of some twenty starters. Jno. Hurck, Richard Hurck and William Chrisinger, all on 1¾ H. P. Indians, finished in a bunch in the order named, meting out a savage defeat to the rest of the contestants. The time was 7:30.

W. W. Leathers, in a White, showed the way across the tape in the five mile event for cars weighing less than 1432 lbs. W. C. Walker in a Jackson was second.

The next event was the "St. Louis Championship," at five miles. O. Parvin, in his Pope Toledo, easily captured the honors, with W. C. Walker (Jackson) and W. W. Leathers trailing him in the order named. The time was 6:30 1-5.

An owners' race and a ladies' novelty race, each at two miles, were also "contested." A special race for light delivery wagons was disposed of in the same expeditious fashion as the first event—that is to say, it was not run because of lack of entries. The summarie:

Five miles for motorcycles—John Hurck, 1¾ Indian, first; Richard Hurck, 1¾ Indian, second; William Chrisinger, 1¾ Indian, third. Time, 7:30.

Five miles, for cars weighing 1,432 pounds or under—W. W. Leathers, 15 H. P. White, first; W. C. Walker, 18 H. P. Jackson, second. Time, 7:11 1-5.

Five miles, free-for-all, for championship of St Louis—O. Parvin, 20 H. P. Pope-Toledo, first; W. C. Walker, 18 H. P. Jackson, second; W. W. Leathers, 15 H. P. White, third. Time, 6:30 1-5.

Two miles, for owners -I. E. Schuck, 18 H. P. Jackson, first; L. Pickel, 12 H. P. St. Louis, second. Time, 3:30 4-5.

Novelty, for lady drivers—Mrs. J. C. Underwood (Moline), first; Mrs. F. Starke (St. Louis), second; Mrs. W. E. Bowman (White), third. Time, 4:00.

Morrell Gets a Mantel Ornament.

Several newspaper men and several tradesmen gathered at the Waldorf-Astoria, New York City, last Thursday night, to present Robert Lee Morrell, chairman of the racing board of the American Automobile Association with a piece of bric-a-brac, done in bronze, entitled the "Dance," and to tell him how well he managed the Vanderbilt Cup Race. Why a mantle ornament suggestive of terpsichoreism instead of motoring was selected not even the guests, who had each contributed something towards the memento, could explain.

The toastmaster or committee in charge of the affair was a foreign American citizen who, it is said, recently beat the racing board's head out of a large sum at the German national game. Whether the pinochle episode pricked his conscience sufficient to make him want to "square" himself was not stated at the banquet. After the dishes had been cleared away and were replaced by what usually follows, the guests, for diversion, took to eulogizing Morrell, who is really a good fellow, in song and speech, and one of the elect even went so far as to proclaim him the "Napoleon of Automobiling."

Wisconsin Law Gets a Set-Back.

Judge Fowler has handed down a decision in the case of the city of Ripon, Wis., vs. Dr. A. Mitchell, of that city, for an alleged violation of the ordinance regulating the speed of automobiles. The decision is the result of arguments made by attorneys for Dr. Mitchell, who was sued by Ripon for the recovery of penalty for alleged violation, that the City Council had no authority to pass such an ordinance, and that any vehicle can go at any reasonable speed upon the streets of cities.

Judge Fowler holds that the ordinance is perfectly valid; that an automobile driver must stop at a given signal from a person driving a horse or team, and that the city has a right to enact an ordinance of that kind to protect its commerce and trade. In reference to the last, the court ruled that to protect horses, farmers' and others, in the city any municipality has a right to adopt an ordinance similar to that enforced in Ripon.

Herr Conrad on Carbonic Gas.

In a recent lecture before a German technical automobile society Herr Conrad introduced the subject of carburetted hydrogen motors, illustrating by means of lantern slides a description of a five cylinder motor of his own design, in which carbonic acid gas was employed as a source of energy. The designs showed three power cylinders, one for compressing the gas and one-fifth for starting the engine. A special feature of the design lay in the fact that slower rotational speed than is common with the ordinary gasolene motor was contemplated, in conjunction with increased flywheel momentum. It was stated that by increasing the consumption a proportional increase in power would be obtainable, and that on that account the usual transmission mechanism might be done away with. Herr Conrad is working in a field which is not overcrowded with investigators.

A. A. A. Takes up Map Making.

At the November meeting of the board of directors of the American Automobile Association held in New York City last Thursday, 9th inst., it was decided to create a Routes and Maps Committee, of which Asa Goddard, Worcester Automobile Club, will be the chairman. This committee will be a subdivision of the National touring committee and a systematic plan for perfecting and revising the information concerning the main routes of automobile travel, with hotel and garage appointments, will be put into operation immediately. Goddard will personally travel over a number of the routes to better his mission.

Besides several individuals the Philadelphia Automobile Association, the Red Devil Automobile Club of St. Louis and the Indianapolis Automobile Racing Association were admitted to membership.

In reference to government aid in the building of roads the following resolution was adopted:

Resolved, That the American Automobile Association, through its State organizations, clubs, and individual members, shall begin immediately efforts in behalf of the measure known as the Brownlow-Latimer bill, which aims to create in the Department of Agriculture a bureau to be known as the Bureau of Public Roads and to provide for a system of National, State and local co-operation in the permanent improvement of the public highways. Furthermore, this Association believes that the country is now ready to demand National aid in the construction of public highways, and in consequence all road users should unite in a unanimous call for an early consummation of that which meets popular approval.

Mixing Food and Motor Cars.

Efforts are being made to bring automobiles and breakfast foods into closer relationship, and this peculiar combination will be sprung on an unsuspecting public at Jacksonville, Fla., the week of Januuary 4-18, when an automobile exhibit will be grafted onto a pure food industrial show that is due to hold the boards there. It is W. J. Morgan, just now very active in planning a profitable season for the Florida hotel proprietors, who will endeavor to mix the food and the automobiles.

Will Climb Stump Hill on Saturday.

The Rhode Island Automobile Club will hold its annual hill climbing contest Saturday of this week, 18th inst., instead of on Thanksgiving Day, as originally planned. Stump Hill, in Pawtucket, has been selected for the climb, and three classes for gasolene and one for steam cars is provided. Stump Hill is about half a mile long, with no turns, and averages a grade of 16 per cent.

May Build New Road to Niagara.

It is reported from Lockport, N. Y., that the Niagara, Lockport & Ontario Power Co. is planning to operate a line of public motor conveyances along the line of its right of way from Niagara Falls to Rochester. It is known that the company is planning to construct a road over the line for the use of its repair men and other employes, but the rumor that this will be a broad macadam road similar to the State highways, and that it will throw it open to the public and operate a line of motor cars upon it, is as yet unconfirmed, though not denied. The report states that the road may also be continued along the company's grant as far as Buffalo, and that supply stations will be established at ten-mile intervals along the way.

Chicago Club Again Chooses Farson.

At the annual meeting of the Chicago Automobile Club the regular ticket was elected without opposition. John Farson was chosen to succeed Ira M. Cobe, who has been at the head of the organization since Mr. Farson's resignation last spring. The other officers elected were: First vice-president, Allen S. Ray; second vice-president, B. H. Marshall; secretary, Sidney S. Gorham; treasurer, T. J. Hyman; directors, Ira M. Cobe, Robert Tarrant, Jr., F. C. Donald, Jerome A. Ellis, Charles E. Gregory and N. H. Van Sicklen. Secretary Gorham, in behalf of the old board of directors, presented a silver loving cup to the retiring president.

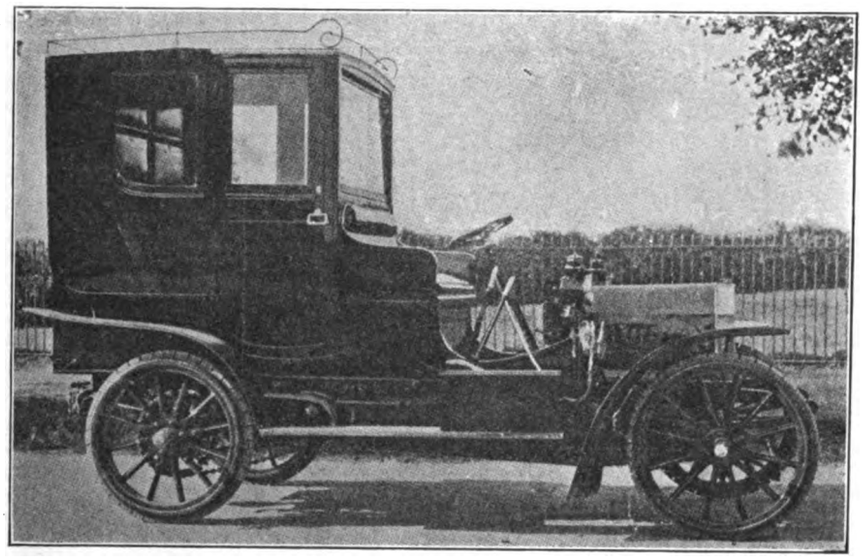
Good Roads Amendment Was Carried.

Although the actual figures have not been made known, yet it is definitely stated through the Automobile Club of America that the amendment which provides for the creation of a $50,000,000 bond issue for improving the highways of the State of New York was carried at the election on the 7th inst. As is known, under the provisions of the amendment, the State is empowered to issue $5,000,000 worth of bonds each year for ten years, the tax levy on which will fall 50 per cent on the State, 35 per cent on the county and 15 per cent on the town.

Claims Two-Miles-a-Minute Cars.

According to an attaché of the Darracq house in this country, three speed creations of 200 horsepower each, guaranteed to make two miles a minute, have been built by the Darracq company in France, and are to be brought to this country and be given a chance at the Florida carnival in January next. The cars are to be driven by four cylinder engines, and there is direct drive on all speeds, three forward and one reverse. No differential will be employed.

Edison Gets a New Car.



Thomas A. Edison, who does not believe in gasolene, pneumatic tires and a lot of other things, has evidently experienced a change of heart. There was delivered to him last week a 1906 Grout four cylinder touring car, which uses gasolene, and which, of course, is fitted with pneumatic tires.

DESIGNED FOR A DRUMMER

Features of a Car Built Specially for his Use—Includes Even a Folding Desk.

Of all the possibilities which the commercial motor vehicle presents to the world, none is more attractive than that which is held out to the commercial traveller. It promises to him a ready means of getting about from place to place in a certain and economical manner, and at a rate of speed which is wholly dependent upon the highway condition of the locality in which his work is cast.

It offers to him a mode of transit which is more pleasast than that by railway, and one which has the added advantage of being timed according to the independent schedule of his own engagements; and, better still, it provides him with a means of carrying his wares and samples wherever he may elect to go, without the loss of time occasioned by the delays of express and baggage.

Of course, the pleasure car has been adapted to the needs of the travelling salesman in many instances with good results, and already several special forms of machine have been designed for his especial use. Of these, probably the most elaborate which has been constructed, unless some of the purely advertising ventures be taken into account, is that which has recently been completed by an English firm and which is here illustrated.

It is called a traveller's brougham, and is adapted to provide its user with a considerable measure of convenience, as well as to give ample storage space for his goods. There is a large locker, measuring 33 by 33 by 19 inches inside, for general storage, while inside the body and behind the passenger's seat are four lockers measuring in the aggregate, 36 by 39 by 12 inches, all of which are accessible from within. Under the driver's seat is another storage space, which is 34 by 12 by 18 inches, while under the floor is still another compartment with a carrying capacity of two cubic feet. Tools and spare parts may be carried in boxes which are placed under the footboards on either side.

The total carrying capacity of the vehicle, allowing for a reasonable stock of parts and supplies, is 27 cubic feet. The body is mounted on a 16 horsepower two-cylinder chassis, which is shod with solid tires.

The carriage work is of a high order, and the comfort of the traveller is looked after in the most approved fashion, the body being fitted with a folding writing desk and other luxuries.

Injecting Water Into Tires.

In an effort to keep them cool some motorists make it a practice to inject a small amount of water into the tires when inflating them. This practice, while effective to a certain extent, is a not unmixed benefit, for in case of a puncture the water quickly finds its way into the shoe, there to rot the fabric and cause its speedy decay. In any case, although the water cooled tire heats more slowly than one which contains air alone, once it is hot, it takes more time to cool by the same token, and, though in certain cases it may be a good plan to use a small amount of liquid, still the presence of any great amount of it tends to wear away the interior of the tube by its swirling action and shortens its life.

For Soldering Nickel.

For soldering nickel The Scientific American recommends the following compound: For fine or high grade nickel: Three parts of yellow brass, one part of sterling silver. For low grade nickel: Fifteen parts of yellow brass, five parts of sterling silver, four parts of zinc (pure or plate zinc). Melt the brass and silver with borax with a flux, and add the zinc in small pieces; stir with an iron rod, pour into a slab mould and cool slowly, when it can be rolled thin for cutting.

OILS FOR GAS ENGINES

"Fire Tests" and "Carbon Tests" Explained—Thick Oils vs. Thin Ones.

"The proper lubrication of a gas engine is a difficult problem to solve, owing to the fact that the heat generated in the cylinder is so great, that upon coming in contact with it any oil is almost instantly consumed," said E. Tomlinson, manager of the Havemeyer Oil Company, a few days since when the subject was under discussion. "This necessitates feeding it into the cylinder in a continual stream, fresh oil being needed to take the place of that which is burned up.

"The first thing, therefore, that an oil should have is an ability to stand as much heat as possible before burning up. The measure of this quality is known as its 'fire test'—for example: If an oil is said to have a fire test of 500, it means that up to temperature of 500 Fahrenheit the oil remains chemically unchanged, but that beyond and above that point it burns up. So, to begin with, a high fire test is necessary in order that the oil may remain in the cylinder as long as possible to perform its work of lubrication.

"But this quality alone is not all that goes into the making of a good gas engine oil, for in burning up, as the oil eventually does, whether its fire test be high or low, it deposits all about on the inside of the cylinder small particles of flakes of carbon. This produces the greatest trouble that an automobilist has to contend with, for the spark plugs or igniter points quickly become incrusted with this deposit to such an extent that the electrical contact is interfered with and the spark which gives the explosion is no longer made.

"Different kinds of oil contain greater or less percentages of carbon, so that some oils will deposit upon being burned less carbon than others, and the whole proposition is finally narrowed down to a point where it is simply a question of the selection of an oil which shall contain within itself two properties, (1) a high fire test, in order that the maximum amount of lubrication may be given, and (2) a low carbon test, in order that when consumed a minimum deposit of carbon may be left.

"An oil which can combine to the greatest extent the extremes of these two characteristics will be the best oil to use. Both properties mentioned—the fire test and carbon test—are ascertainable by the employment of physical tests, and it is perfectly possible to determine with mathematical certainty which oil among a given number is more suitable for use in the cylinder of an automobile and will give it the most efficient lubrication.

"The viscosity is also a factor. The viscosity of an oil is the measure of its 'body' or fluidity. It is ascertained by filling a small vessel with a certain quantity and allowing the oil to run out of a small hole at the bottom, the number of seconds required for this

Digitized by Google

operation to take place is the viscosity which the oil is said to have.

"A very common mistake is to select an oil because it appears to be thick and heavy. The thickness or viscosity that an oil has when seen at a normal temperature is very different from the body it will have when subjected to the intense heat that it comes in contact within the cylinder. Ordinarily speaking, the thinner an oil is, provided it has the proper fire test, the better it will be for use on an automobile, for it will reach and lubricate more readily the crank bearings and crank pin bearings than the heavier oil."

What May Cause Water Troubles

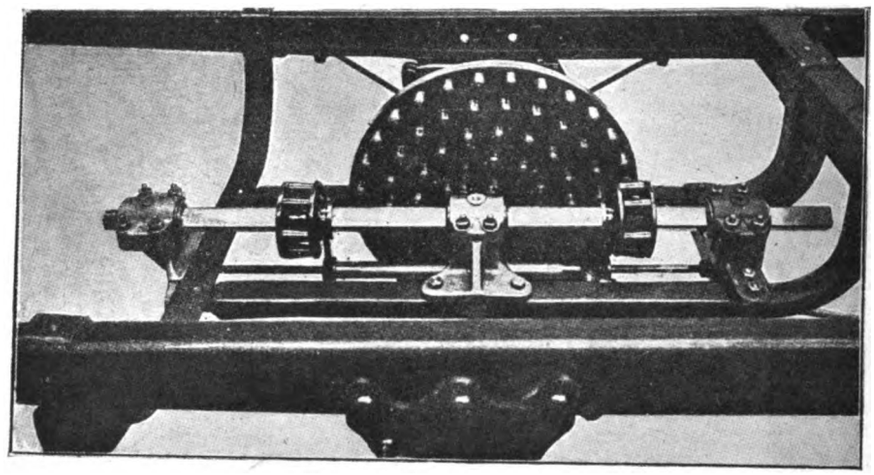
Not infrequently the cause of trouble with the water circulation may be traceable to the rubber connections, which are designed to provide the requisite amount of yieldability to the system. In some cases hose is used which is too small for the purpose, the result being that when it is put in place, the inner lining is "skinned" off, and turns back over the opening in the pipes, thus partially clogging them. In other cases, where hose that is too small has been used the interior becomes soft through the actiton of the water or as a result of the use of some antifreezing mixture, with the result that under certain conditions, as for instance, when a suction pump is used, it closes and blocks the passage of the water.

Uses a Trough for Lubrication.

A decidedly novel wrinkle in the matter of cylinder lubrication has been adopted by a well known foreign manufacturer on his 1906 cars, which insures a constant and plentiful supply of oil to the most seriously taxed surfaces in the entire machine. A little trough is cast in the engine base at the foot of each cylinder, so placed that the piston dips into it at each down stroke. The troughs are filled automatically, and the overflow is filtered before being returned to the crank case for further use.

Here's Another Oil Test.

A "simple and practical method of testing lubricating oils," for use in a gasoline engine, is this one that comes from abroad: Heat a pane of glass to various temperatures, holding it an angle of 45 degrees with the horizontal, and allow samples of the different oils to be tested to run over it. That which runs farthest without evaporating under the greatest heat is the most suitable.



Locating the Leaks.

Leakages in compression are best located by mixing up a heavy lather with soap and water and applying it around all doubtful points with a fine brush. Any faulty joints will then be shown at once by the fine bubbles which are formed at the point of leakage. Failing the soap and water, a less delicate test may be made in a similar manner with heavy oil.

PIN AND LANTERN GEARING

Novel Manner in Which the Combination Does Duty for Automobile Transmission.

In the inventor's quest for a form of variable speed transmission which shall satisfy the somewhat varied and complex requirements of that mechanism, many different results have been produced which, as time goes on, have been seen to gravitate toward one of two systems for the most part. That is to say, leaving out of the question the forms of purely frictional gear whichever have been in the background, practically all the transmissions which have been produced readily fall under the classification of the planetary or sliding gears. A totally new departure which has recently come to light in Great Britain is that of a mechanism which uses a combination of pin and lantern gearing.

PIN AND LANTERN GEARING.

Essentially this new form of transmission consists of a shaft which is placed lengthwise of the car and which carries two driving gears of the lantern type. These consist of a cage comprised of a pair of discs connected by a series of pins circumferentially arranged, upon which are mounted a series of rollers. These gears are slidably mounted upon the squared driving shaft, and their position is controlled from the driver's seat. Mounted on a shaft at right angles to this, is a disc upon the face of which four sets of pins are arranged in a series of concentric circles. The disc, which also is slidably mounted on its shaft, may be moved toward or away from the driving shaft, at the will of the operator.

The final drive is taken from the transverse shaft to the rear axle by means of a chain in the usual manner, while the connection with the engine is made by a friction clutch of the ordinary type. The mechanism which serves to withdraw the clutch, also actuates the driven disc, drawing it out of action with the pinions.

The action of the device is as follows: By pressing down the clutch pedal the operator withdraws the clutch, at the same time drawing back the disc and permitting the free passage of the pinions along the driving shaft. The shifting lever is then moved until it registers with a position corresponding to one of the speeds. The pedal is then released and the disc is automatically returned to its normal position, which is just far enough from the driving shaft so that the pins upon the disc will bear upon the rollers on the driving pinions. At the same time, or an instant later, the clutch takes hold, and the car starts. In a similar manner the changes from one speed to another are made, and the reverse obtained, for the latter purpose the second of the two driving pinions being called into requisition.

The clutch pedal is made up of two plates, one of which is nearer the bearing point than the other, so that on pressing upon it the leverage obtained is not sufficient to withdraw the disc, though it is ample to free the clutch. In this way the car may be handled on the clutch in the ordinary manner, without taking the gears out of mesh. When this becomes necessary, however, the upper portion of the pedal is depressed, and the complete motion is obtained.

Without going into complete details of the mechanism, it is evident that it is absolutely interlocking, and that no amount of mischance can make it possible to strip the gears through partial meshing, since from the method of arrangement it is impossible to have more than one gear set in mesh at one time, and since it is impossible to bring the disc into its running position unless the teeth or pins mesh in the proper way.

Whatever may be the practical efficiency of the system, and its amount of durability in use, the fact remains that the frictional loss is the same for all drives, and that the quantity of mechanism is considerably less than that in use in many forms of gear which already have been accepted by the public and put to everyday usage.

The Rainier Co. is claiming a unique record—that of having sold seven Rainier cars to seven different members of one family, the McKenzie family, of New York.

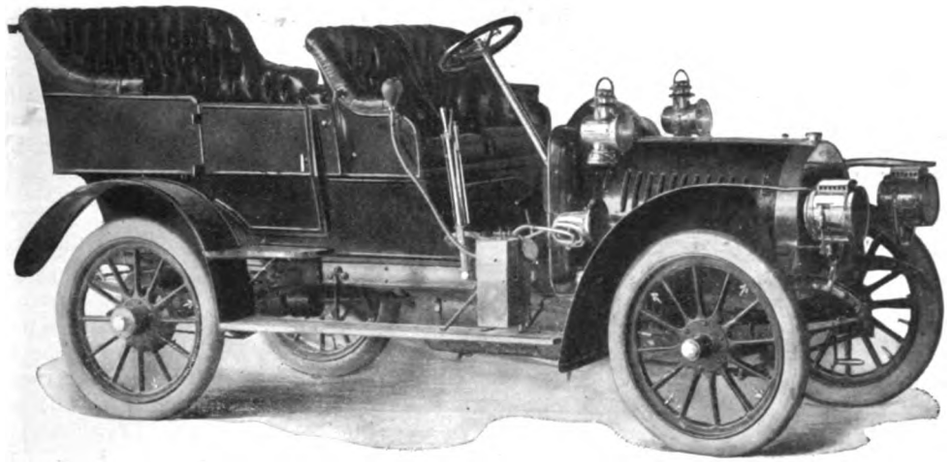
Digitized by Google

The New Model 1906

Rainier

30-35 H. P.

What is the automobile buyer going to do when he is strenuosly told that each and every one of the 1906 cars is THE BEST CAR IN THE WORLD?



He is going to do a little investigating.

He is not going to be attracted nor distracted by the whirlwind of words with which one car after another comes before the public on paper.

When he gets down to business, he will find the RAINIER in the front rank of cars that have won renown and made fast friends by actual achievement. He will find that in every inch of metal and wood, in every working part, in every line, the Rainier as it will take the road in 1906 is the very embodiment of strength, compactness, lightness and beauty —now more than ever before "The Pullman of Automobiles."

We want good Rainier agents in all unassigned territory. We can give them a car to sell that WILL sell, and that will make a new salesman of every purchaser. We stand back of the Rainier with the broadest and most liberal guarantee ever given.

Correspondence invited.

ENGINE.	30-35 H. P., 4 cylinders water cooled.	**VALVES.**	Mechanically operated, inlet and exhaust interchangeable.
IGNITION.	Sims-Bosch Magneto—make and break spark.	**CARBURETTER.**	Float feed, requiring no adjustment.
TRANSMISSION.	Sliding train. 3 speeds forward and one reverse.	**BRAKES.**	Two internal expansion, dust protected, operating on rear hubs through emergency lever, holding either forward or backward. Foot brake operates on propeller shaft. Both brakes bronze against steel.
REAR AXLE.	Bevel gear drive, clutch driven hub. Ball bearings.		
FRONT AXLE.	I Beam section. Ball bearings.		
FRAME.	Cold rolled pressed steel, aluminum under bonnet covering entire engine and transmission.	**BODY.**	Full aluminum, double side entrance.
WHEEL BASE.	104 inches.	**EQUIPMENT.**	Two head lights, 2 side lights, 1 rear light, 1 horn.
WHEELS.	Imperial whalebone, grade A 2nd growth hickory.		
TIRES.	Continental 34 x 4.		

Price, $4,000.

The 22-28 H. P. will be continued as heretofore, without any changes.

4 cylinder—98 inch wheel base—La Coste coil. French battery. Continental Tires. Aluminum side door body

Price, $3,500.

BOTH MODELS GUARANTEED FREE OF REPAIRS FOR ONE YEAR.

The world's broadest and most liberal automobile guarantee.

Landaulet bodies for immediate delivery. Limousines for November and December delivery.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

Boston Agents: MORRISON-TYLER MOTOR CO.

Good Agents wanted in unassigned territory.

When the Injured File their Bills.

"Whenever an automobile gets mixed up in an accident of any kind there is bound to be a claim for damages," said a man who has had some experience in settling matters of this kind. "Usually the claims are for many times the amount that could justly be asked, and frequently there is no just basis for a claim at all, but the prevalent impression seems to be that anybody who owns an automobile is a millionaire, and should, therefore, be made to suffer.

"A woman came into my office a short time ago and wanted me to collect for her a claim of $60 for damages to her carriage, which, she said, had been smashed in an automobile accident the day before. I learned from her that the owner of the automobile was also a client of mine. On inquiry I found that his automobile had been standing still beside the road when her carriage ran into it. He refused to pay her anything.

"Three weeks later she began suit for $5,000 damages, alleging in her complaint that she had been so seriously injured in the accident that she had been confined to her bed for two weeks, and this in spite of the fact that she had been able to visit my office the day after the affair.

"In refreshing contrast was the action of a gentleman who, with his wife, got in the way of an automobile belonging to a client of mine. Both were knocked down and slightly hurt, although the chauffeur did all in his power to avert a collision. The next morning my client received a letter from the gentleman stating that the fault was all his and that the chauffeur was to be complimented on his success in averting what might have been a serious catastrophe."

Potter Learns Roads are not Free.

Dr. Carlton Potter, of No. 82 Commonwealth Avenue, Boston, finds himself in a somewhat equivocal position in that he is the owner of an automobile which he cannot use although it is in good order and the roads of America are supposed to be free. The State. Highway Commission recently revoked his certificate of registration, and also nullified that of his chauffeur, who has been convicted of fast driving four several times during the past season. The car cannot legally be used again during the remainder of 1905, and the chauffeur's license cannot be renewed before 1906.

Meeting the Shotgun Campaign.

Shotgun legislation in Missouri is going to be given a heavy recoil, and the instrument is the St. Louis Automobile Club. The organization has employed some of the best legal talent in the State to represent it in its fight for just legislation.

"If you run your automobile more than nine miles an hour in St. Louis County," the opening paragraph of the circular sent to every automobile owner in the State reads, "you are liable to be held up by rather suspicious looking individuals, with long revolvers pointed in your face. You are then arrested and released on $200 bond to appear before a justice." Protest is made over the fact that many counties ask and require licenses for running automobiles through them, and the club will in particular test this law, as well as the efforts on the parts of the authorities to keep the speed down to nine miles an hour. As matters now are, it costs nearly $60 in licenses alone to pass through the State from St. Louis to Kansas City.

Vaseline as a Dirt Remover.

Common everyday vaseline is the best protection against grease and dirt, according to a motorist who says he has tried it. A little rubbed into the hands each morning and noon is a hundredfold better than any dirt remover made, and a 10-cent bottle will last two months. The vaseline works into the pores of the skin, forming a coating which is impregnable to any dirt. This is washed off at night, using soft water and a good soap lather. After a thick lather is obtained, dip the hands in cornmeal and proceed, using soap alone, rubbing the meal into the crevices of the hands and fingers. For the callous places on the forefinger a cake of scouring soap is used, rubbing on lightly, if necessary. Instead of "rasping" the dirt off, as would be supposed, this process readily dissolves it.

Big Bid for Testimonials.

A distinctly novel method of advertisement has been adopted by a firm of foreign manufacturers by way of introducing their new model car. All owners of their last year's type are invited to send in full particulars of the performance of the machine during the time it has been in their possession, and the company, taking account of all of these, agrees to furnish to him who has achieved the most satisfactory results all things considered, one of their latest cars in exchange for the old one, absolutely without cost.

To Curb the Chauffeur.

Cables from Paris state that to reduce the number of accidents the French interdepartmental commission will recommend that an age limit for chauffeurs be set, that a medical certificate be required of all applicants and that all previous convictions be reported to the Minister of the Interior. In addition it is proposed that a speed limit be set for localities within village limits, and that the names of the maker and owner of each car be placed on a plate which will be decipherable at a distance.

Walter Gets His Diploma!

"Walter Wright, one of our young society men, has gone to Philadelphia to study automobiling.—From Toms River (N. J.) Democrat, October 19, 1905.

"Walter Wright, who returned from Philadelphia with a diploma from an automobile training station, left on Wednesday morning for Lakewood, where he is employed.—From Toms River (N. J.) Democrat, November 2, 1905.

Hillsboro Sees a Skydoodle Wagon.

Hillsboro, Ill., has been visited by an automobile, an unprecedented occurrence, and the visit naturally excited the editor of the solitary paper in the town. He thus gives vent to his feelings:

"A big touring automobile passed through Hillsboro last Monday and created almost as much excitement as the split-log drag did in Greenville last spring. It was the biggest skydoodle wagon ever seen here. It had big brass eyes in front and behind, and it bristled all over with levers and valves and faucets and set screws and knobs and handles. The car was covered with canvas, and evidently cost more than a farm in the corn belt. When in front of Latham's hardware store it took a severe paroxyism and phthisic and wheezed and coughed like a horse with the heaves. The chauffeur (pronounced 'shofur') got out and took off its dewlap and scraped its innards with an ivory handled scalpel. Then he picked a cinder out of its left eye with a ten-dollar toothbrush and gave it a drink of absinthe. It coughed up a quart or two of gasolene and was all right. The only occupants of the devil wagon were the 'shofur' and two duchesses supposed to be from Sterling or Chicago or some other place up North where millionaires are as thick as chiggers at a Free Methodist camp meeting. They were headed for St. Elmo, in Fayette County, and as they flew down the Andalia road the women along the route hid in the smokehouses and the men ran yelping into the brush."

Here's the Negro's Non-stopper.

Not perpetual motion this time, but a "four-day non-stopper," has appeared in Missouri. A St. Louis black man—name not given—has invented an automobile that promises to fulfil the dream of rural mail carriers, and also a few others who aspire to possess but lack the wherewithal. The first machine sold for $250, and as soon as the son of Ham rounds up enough capital cars will be placed on the market for $150 or less. According to a home paper, "this wonderful machine will be able to maintain a speed of thirty-five miles an hour for four days without stopping." Whether it will go after that is not stated.

Wilbraham's Limit is Upheld.

Notwithstanding the appeal filed with the Highway Commissioners of Massachusetts against the action of the Selectmen of Wilbraham in passing an ordinance limiting the speed of automobiles to eight miles an hour, that august body has approved the restriction, and signs will be posted next week. Eight miles an hour is the limit allowed through all villages in that town.

Teaching it in School.

A series of lectures on motor car engineering have been instituted in the municipal training school of the city of Liverpool, Eng., which will be delivered by a local member of the trade. Seventy students appeared on the occasion of the first installment of the series.

The Week's Patents.

803,116. Lathe Attachment for Turning Crank-Shafts. Dean C. Lewis, Ardmore, Penn., assignor to The Autocar Company, Ardmore, Penn., a Corporation of Pennsylvania. Filed December 8, 1904. Serial No. 235,995.

Claim.—1. In a lathe for turning crank-shafts, in combination, a head-spindle, a face-plate, secured to the head-spindle, having an orifice, to receive the shaft, eccentric to the lathe-axis, a tail-spindle, a bushing having a central orifice adapted to receive the shaft and orificed portions, in one of which at an angle thereto and to each other the tail-spindle is adapted to rest, a rotatably-mounted plate intermediate of the head and tail spindles, said plate, having an elongated orifice, extending from the centre thereof, said plate carrying clamping devices.

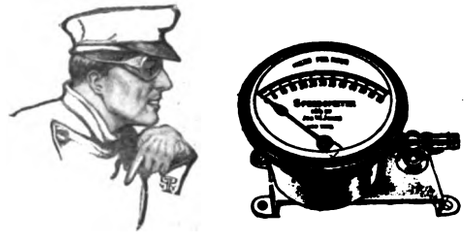
803,121. Rear Axle for Automobiles. Frederick C. Miller, Cincinnati, Ohio. Filed April 13, 1905. Serial No. 255,277.

Claim.—1. A rear axle for automobiles, consisting of a tube, the intermediate walls of which are swaged apart from the centre of the tube forming a housing, a wheel-shaft projected through the tube into the housing, and a transmission mechanism for the shaft within the housing, substantially as described.

803,275. Rotary Engine. John A. Eaton, Chicago, Ill., assignor of one-half to Charles M. Seckner, Chicago, Ill. Filed December 4, 1903. Serial No. 183,702.

Claim.—1. In a device of the class described an annular steam-chamber, a piston therein, a shaft, means operatively connecting said piston with said shaft, a cut-off valve,, a cam on said shaft and toggle means connected with said valve and operated by said cam adapted to operate the cut-off valve.

803,289. Throttle and Regulating Device for Explosive-Motor Vehicles. Thomas B. Jeffery, Kenosha, Wis. Filed June 27, 1904. Serial No. 214,436.

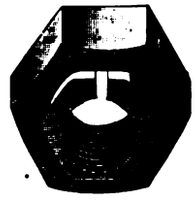


Claim.—1. In an explosive-motor vehicle in combination with the gas-inlet valve and means for opening and closing it, the gas-inlet pipe having an air-inlet port intermediate the gas-inlet valve and the motor; a valve for controlling such air-inlet port; a spring which tends to close such valve; connections for opening it connected with the means for operating the gas-inlet valve adapted to open said air-inlet as the gas-inlet closes, and a trip for disengaging said air-inlet-valve connection to permit the latter to be closed by the spring without reversing the gas-inlet-valve movement.

803,310. Nut-Lock. Jacob T. Smith, Dublin, Va. Filed May 20, 1905. Serial No. 261,318.

Claim.—1. In a nut-lock, a bolt having its threaded end provided with a channel or groove, and a nut provided at one corner with a lug or teat, in combination with a locking member looped around the teat and having a portion disposed in the channel and a terminal seated in the valley of the bolt-thread.

803,324. Rotary Engine. Peter Bartoletti, Brownsville, Penn. Filed February 4, 1905. Serial No. 244,113.



Claim.—1. A rotary engine comprising a cylinder having an abutment formed with a passage extending from end to end of the abutment, a piston mounted to turn concentrically in the said cylinder and provided with spaced rims forming with the cylinder-heads a working chamber between which rims extends the said abutment, the piston-web portion extending between the rims passing through the said abutment-passage, the said piston-web portion having spaced openings, wings in the said opening, mounted to turn in bearings in the piston-rims, shoes secured on the outer pivots of the wings, and

ACCURACY!

The accuracy of the Speedometer is attained by the mechanically perfect application of an absolutely unchangeable law. The standard of perfection of this instrument will never be equaled by devices based on theories, the practical application of which is so impossible that they were discarded in the development of the Jones Speedometer. oppositely-disposed cams on the heads of the cylinder, engaged by the said shoes, for turning the wings.

803,326. Vehicle-Wheel. James M. Carpenter, Millersburg, Ohio. Filed April 14, 1905. Serial No. 255,491.

Claim.—1. A vehicle-wheel tire comprising a plurality of short segmental pivotally-connected links, lateral wings on the links or sections, teeth on the links and extended transversely thereof, arms extended inward from certain of said wings, spoke-engaging clevises adapted for removable engagement with said arms, the said clevises being extended at an acute angle to connection with the spokes, and metal plates on the spokes with which the clevises engage.

803,339. Internal-Combustion-Engine Regulator. Albert N. Hatherell, Appleton, Wis. Filed June 21, 1904. Serial No. 213,444.

Claim.—1. An internal-combustion-engine regulator, comprising the combination with an eletrical igniting system, of means for establishing a short circuit therein, and including a centrifugally-operated member connected to turn in synchronism with the engine and adapted to be thrown into action by the centrifugal force.

803,345. Pneumatic-Tired Wheel. Thomas B. Jeffery, Kenosha, Wis. Filed November 21, 1904. Serial No. 233,697.

Claim.—1. In a vehicle-wheel, in combination with the felly having a peripheral rim overhanging at the sides, a flexible tire-casing having beads or enlargements at its lateral edges, such beads or enlargements being engaged under or within the overhanging margins of the rim, and guards adjustably secured to the felly within the circle of such beaded edges adapted to be adjusted bodily radially with respect to the wheel for holding the edges outward against the overhanging margins of the rim.

803,354. Means for Relieving Cooling-Jackets of Steam and Indicating the Circulation of Water Therethrough. John E. Miller, Belvidere, Ill., assignor to National Sewing Machine Company, Belvidere, Ill., a Corporation of Illinois. Filed October 6, 1902. Serial No. 126,120.

Claim.—1. In an apparatus for the purpose described, the combination of a water-cooling jacket, a water-circulating means comprising a passage, a steam-relief leading from said jacket to a point above the general level of said passage, and a transparent connection between the upper end of said relief and said passage whereby the circulation of the fluid through said relief may be observed, substantially as set forth.

803,361. Traction-Engine. Robert Reed, Logansport, Ind. Filed October 28, 1904. Serial No. 230,329.

Claim.—1. In a traction-engine, the combination of a motor, a motor-shaft, a main shaft in a plurality of parts, means for transmitting power from the motor-shaft to one of said parts, means for transmitting power from each of the other parts of the main shaft for propelling the vehicle, and means for uniting the first-named part of the main shaft with any of the other parts, or with all of them at the same time.

803,367. Cushion-Tire. Carl G. Shaw and Webb J. Shaw, Los Angeles, Cal. Filed July 7, 1905. Serial No. 268,676.

Claim.—1. A cushion-tire comprising numerous radially-disposed rigid members embedded therein at the tread portion thereof, and reticulated material connecting the members and embedded within the tire circumferentially thereof.

803,406. Rotary Engine. Thomas Davis, New Haven, Conn. Filed May 18, 1905. Serial No. 261,069.

Claim.—A rotary engine comprising a cylinder, a recess formed therein, the wall of said recess forming an arc of a circle of smaller diameter than the diameter of the cylinder, a piston eccentrically mounted in said cylinder and of a diameter to closely fit the surface of said recess, said piston formed with grooves in its face, longitudinally-arranged rods mounted in said piston, blades connected with said rods and extending over said grooves and so as to cover the same, said rods being free to turn whereby said blades may be moved away from the face of said piston, spring-plungers mounted tangentially in said piston and bearing against the inner face of said blades, an inlet-port at the top of said cylinder and in position to open between one of the blades and the adjacent face of the piston, and an exhaust-port at the bottom of said cylinder and opened by the passage of said blades in the rotation of the piston, substantially as described.

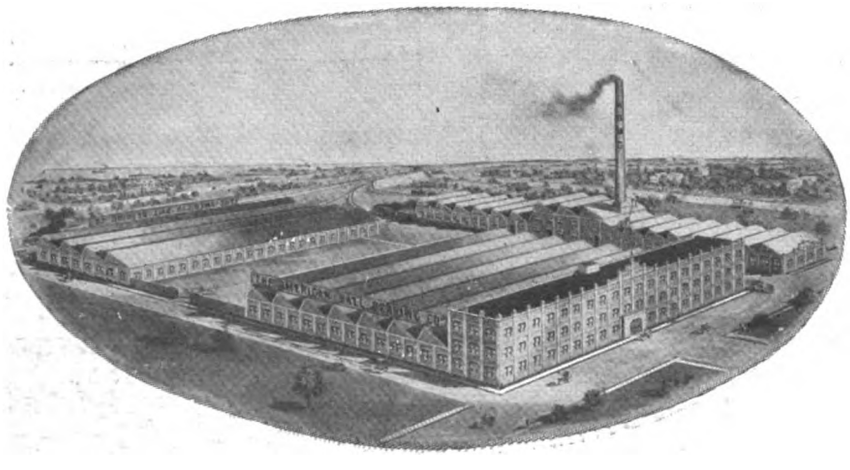
803,468. Fastener for Carriage-Curtains, Etc. Fred S. Carr, Malden, Mass. Filed January 14, 1905. Serial No. 240,997.

Claim.—1. A fastener comprising a socket member having a yielding jaw, and a stud member having an abrupt shoulder adapted to positively engage said jaw to prevent separation of the members while the engaging faces of the shoulder and jaw are in parallel planes and the stud member also having an additional part to act upon said jaw and to disengage said shoulder and jaw when said faces are moved out of paralell planes.

803,500. Vehicle-Wheel. Winfield J. Mitchell and James R. Mitchell, Lynn, Mass. Filed October 3, 1904. Serial No. 226,900.

Claim.—1. A vehicle-wheel comprising a rigid rim, a pneumatic cushion bearing on said rim, annular plates attached rigidly to and projecting outwardly from the rim at opposite sides of the cushion, said plates having inwardly-projecting tire-seats surrounding the cushion and each having two outwardly-projecting ears, and an elastic tire having base portions bearing on the said seats between said ears and having a leg projecting inwardly between the seats and supported by the pneumatic cushion.

803,501. Vehicle-Wheel. Winfield J. Mitchell and James R. Mitchell, Lynn, Mass. Filed January 11, 1905, Serial No. 240,526.



Claim.—1. A vehicle wheel comprising a chambered rim provided with an inner seat and two outer spaced-apart seats, a pneumatic cushion bearing on said inner seat, an elastic tire having base portions bearing on said outer seats, a leg formed of a plurality of elongated segmental members of elastic material seated in said tire and bearing upon said cushion, said members being interposed between said outer seats and having their abutting ends provided with coinciding recesses, and securing devices engaging the recessed portions of said members, whereby the latter are prevented from creeping.

803,510. Pneumatic Tire. William A. Sankey, Sutton, England, assignor to Frank Reddaway, Pendleton, Manchester, England. Filed January 24, 1905. Serial No. 242,545.

Claim.—In combination a vehicle-wheel having its felly provided with lateral recesses, a channelled rim fitting on said felly and having lugs engaging in said recesses, said channelled rim being formed of a stationary part, and a removable part, bolts passing through the lugs of the removable and stationary parts to hold said parts together, a cover having lining rendered impervious to air under pressure having beaded edges and a wire embedded in each of said edges, an endless separate ring to encircle the bed of the rim and wedge the edges of the cover against the sides or edges of the rim, a valve for inflating the cover with means for mounting the valve fluid-tight to prevent the escape of air, substantially as described.

803,522. Change-Speed Gearing. Joseph P. Barnes, Rockford, Ill. Filed February 21, 1905. Serial No. 246,792.

Claim.—1. In a change-speed gearing, the combination of a main frame, a spindle, two bevelled toothed wheels located concentric with the spindle, and facing in the same direction and each provided with a clutch-face, a sliding clutch-section located on the spindle between the bevelled toothed wheels, a toothed pinion for each bevelled toothed wheel and means for revolving the pinions in opposite directions.

The output of complete Front and Rear Automobile Axles of this plant exceeds the capacity of all competition combined.

Timken-Lemoine Front Axle.

Much of the satisfaction resulting from the use of Timken Roller Bearings is due to the simplicity of construction,—few parts and every part a special feature.

We think this explains why it is easy to sell so many of them and why owners of machines demand them.

A good automobile is no stronger than its weakest part. Can you afford to have anything but Timken bearings?

Positive adjustment. No loose parts. Perfect end thrust and you can take up the wear.

All types front and rear axles, Lemoine or Elliott knuckles, direct and chain drive rear axles, truck axles, wheels, channel rims.

TIMKEN ROLLER BEARING AXLE CO.

Main Office and Works: CANTON, OHIO.

PENNSYLVANIA CLINCHER

There are no perfect Motor-Cars, nor any perfect tires—as yet.

But if you have a car which you consider almost perfect perhaps you would like a tire fit to associate with it.

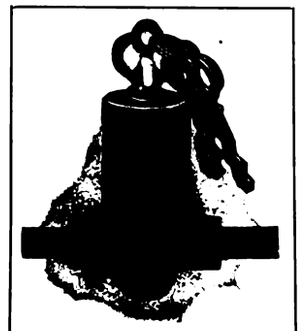
Parts for 1906 Automobiles:

For the convenience and assistance of automobile builders we have prepared complete drawings of our 1906 model pressed steel frames and frame members, and other parts, which will be mailed upon application. We are prepared to build pressed steel frames, change gears, front and rear axles and other parts in any quantity for early delivery.

STEEL STAMPINGS:

We make a specialty of steel stampings of all descriptions, including hubs, parts, brake drums, etc.

STEERING WHEELS:



Another specialty of ours—we make the best steering wheel rim on the market, and a large variety of spiders for application to any steering column.

Send for our Steering Wheel circular

A. O. SMITH COMPANY

Milwaukee, Wisconsin.

No More Borrowing Cars Without Owner's Permission

PATENT APPLIED FOR.

The Hill Lock Valve

(here shown), is a new device and a good one. It is connected at any convenient place in the gasolene pipe and when locked and the key withdrawn prevents the gasolene from flowing to the carburettor and consequently the engine cannot be started. The key cannot be taken from the lock until the gasolene supply is entirely shut off—when shut off keep the key in your pocket. Impossible for anyone to steal your car. Your fuel supply is **locked,** but your car can be pushed to the wash-stand for cleaning, or into the street in case of fire. It is a small device made entirely of brass and turned with a "special key"—no two keys are alike. The lock is of the finest grade, it has five tumblers and cannot be picked or opened without the "right" key. Three keys are furnished with each lock. The locks are perfectly tight, being tested by gasolene under a pressure of one hundred pounds. It is made for all sizes of pipe from the smallest motor-cycle or launch to the most powerful touring car. Price, $5.00. **Special price to Supply Houses and Automobile Manufacturers.** Apply to your supplyman or garage. If not found in stock, address

E. HILL, Jr.,

Norwalk Iron Works Co., SOUTH NORWALK, CONN

THE STANDARD AMERICAN COOLER.

THE WHITLOCK COOLER

was used on the

LOCOMOBILE RACER that finished THIRD

in the

VANDERBILT CUP RACE.

It was never touched during the race. It did its full duty.
It held its water and kept the engine cool.

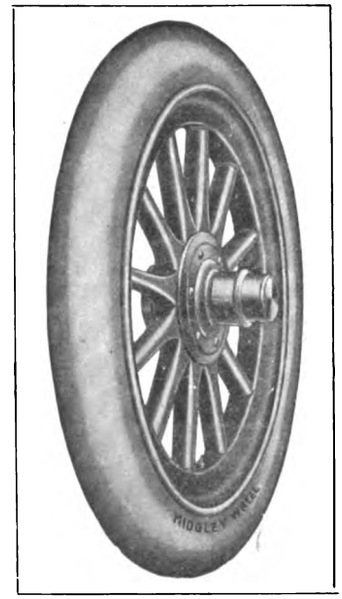
THE ONLY CELLULAR COOLERS MADE IN AMERICA

that were used in the 1905 and 1906 Vanderbilt Cup Races, also the 1906 Gordon Bennett Race.

Quality and efficiency only figure in an event of this importance.
We make coolers of the HIGHEST EFFICIENCY.

The leading makers of automobiles have recognized this fact by adopting

THE WHITLOCK COOLERS



continuously for the seasons of 1903, 1904, 1905, 1906.

THE WHITLOCK COIL PIPE COMPANY,
HARTFORD, CONN.

A DOCTOR'S OPINION

MILWAUKEE, WIS.

"I am so well pleased with the tubular steel wheels made by you for my old Winton that I feel under obligation to express to you my satisfaction with them, and I desire further to compliment your machining of the hubs to fit the new steering knuckles furnished by The Winton Manufacturing Company.

"My machine is now thoroughly over-hauled and repainted, and I was so surprised to see how much the general appearance of the car was improved by your artillery wheels that I thought I would throw you a bouquet and let you join with me in a feeling of complete satisfaction."

Very truly yours,
Chas. H. Lemon.

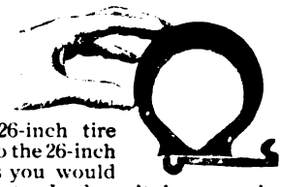
Why Goodyear Auto Tires Won't Creep

DID you ever try to force an inch tube over an inch and a quarter bar—or to put a pair of No. 7 gloves on a No. 8 hand?

You wouldn't be so foolish, would you?

But that's to all intents and purposes what the Automobile Man has to do every time he puts an ordinary tire on an ordinary rim. It's



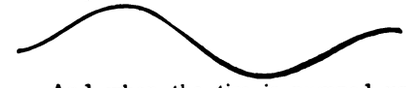
about as hard work as breaking into a bank, and he goes at it the same way, with a "jimmy" and other burglar's tools. Because a 26-inch wheel (for example) is really *27 inches* in diameter, when you consider the flange. So a 26-inch tire has to be forced over a 27-inch rim every time you put on a tire, or take it off.

It's a heart breaking job, even for a strong man, and it takes from half an hour to an hour each time you do it.

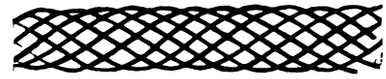
And after you have removed such a tire a few times, the base of the tire becomes stretched, and the fabric (used to strengthen it) becomes broken in places, until this tie becomes 27 inches in diameter instead of 26, a full inch larger that the face of your wheel. So you have to bolt it down, or it will creep, tear the valve out and cause all kinds of trouble. And even then you have to keep it pumped up continually as hard as it will stand.

Now the Goodyear Detachable Auto Tire can't creep, because, in the first place, it doesn't have to be *forced* on (if you use the Goodyear Universal Rim). The 26-inch tire slides right on to the 26-inch rim as easily as you would put on your hat. It doesn't have to be pried over a 27-inch flange.

And next, at the first stroke of the pump, the tire begins to grip the rim like grim death, because there is a mesh or tape of piano wire vulcanized clear around the tire on each side of the base.



When the tire is flat these wires are like this:



And each single wire like this:

The instant you begin to pump, this wire begins to shorten like this:

And when the tire is pumped up hard, the wire mesh is like this:

If you put a Goodyear Auto Tire on a wood rim, and pump it up hard, the pressure will be so great that the base will squeeze a ridge in the wood.

So the Goodyear Auto Tire need be only *half* inflated, and it will still have a firmer grip on the rim than it is possible to secure with plates and bolts. This, however, is only *just one* of the good points of this trouble-saving tire.

You will find other points in our "Good News Book." It is vitally interesting to every manufacturer, dealer or user, for it shows the way to perfect relief from Tire Troubles. It's FREE. Ask for it.

Locomobile

EASILY THE BEST BUILT CAR IN AMERICA.

We announce two new styles for 1906, a powerful four-cylinder touring car, price $3,000, and a larger car at $5,000, both with complete touring equipment. These models are almost identical in design, contain the same carefully selected material, and are constructed with equal care throughout—the result of years of careful and consistent manufacture of the standard type of four-cylinder touring car.

Locomobiles are fully equal in mechanical details and running qualities to the best imported cars but are especially designed for American Roads.

SPECIFICATIONS OF 1906 MODELS.

Type "E" Locomobile—15-20 H. P.

PRICE, $3,000, ready for touring.
EQUIPMENT, 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance seating 5; fitted with top irons; color and striping optional; top and luggage carrier extra.
MOTOR, 4-cylinder, 3¾ inch bore, 4½ inch stroke.
LUBRICATOR, large mechanical lubricator.
CARBURETER, automatic, with balanced throttle valve.
GOVERNOR, centrifugal type, prompt and positive in action.
IGNITION, make-and-break, with iridium contacts.
MAGNETO, low tension, our own design and manufacture.
ALUMINUM PAN, placed underneath the machinery.
CLUTCH, cone type with ample surface.
TRANSMISSION, 3 forward speeds and reverse.
DRIVE, double side chains.
UNIVERSAL JOINT, double universal joint between clutch and transmission.
RUNNING BRAKE, double acting type, large and powerful, metal to metal surfaces.
EMERGENCY BRAKES, internal expansion type, large and powerful, metal to metal surfaces.
COMBINED BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES, "I" section hand-welded axles.
TIRES, 32 inch x 4 inch on all four wheels.
WHEEL BASE, 93 inches.
WEIGHT, about 2,000 pounds.

Type "H" Locomobile—30-35 H. P.

PRICE, $5,000, ready for touring.
EQUIPMENT, 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance seating 5; fitted with top irons; color and striping optional; top and luggage carrier extra.
MOTOR, 4 cylinder, 4½ inch bore, 5½ inch stroke.
LUBRICATOR, large mechanical lubricator.
CARBURETER, automatic, with balanced throttle valve.
GOVERNOR, centrifugal type, prompt and positive in action.
IGNITION, make-and-break, with iridium contacts.
MAGNETO, low tension, our own design and manufacture.
ALUMINUM PAN, is placed underneath the machinery.
CLUTCH, cone type with ample surface.
TRANSMISSION, 3 forward speeds and reverse.
DRIVE, double side chains.
UNIVERSAL JOINT, double universal joint between clutch and transmission.
RUNNING BRAKE, double acting type, large and powerful, metal to metal surfaces.
EMERGENCY BRAKES, internal expansion type, large and powerful, metal to metal surfaces.
COMBINED BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES, "I" section hand-welded axles.
TIRES, 34 inches x 4½ inches.
WHEEL BASE, 106 inches.

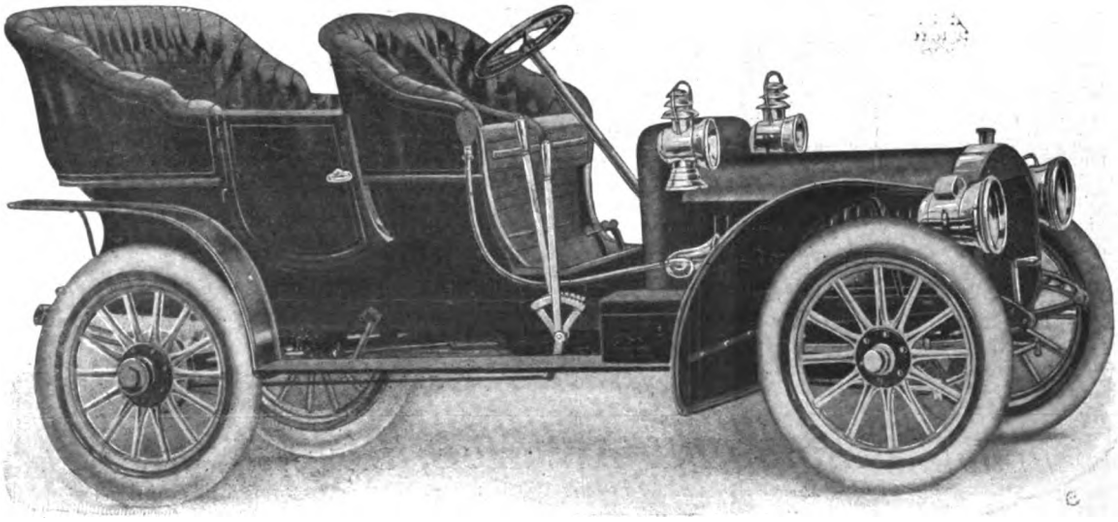
Wayne



An Introduction to the Wayne Cars of 1906

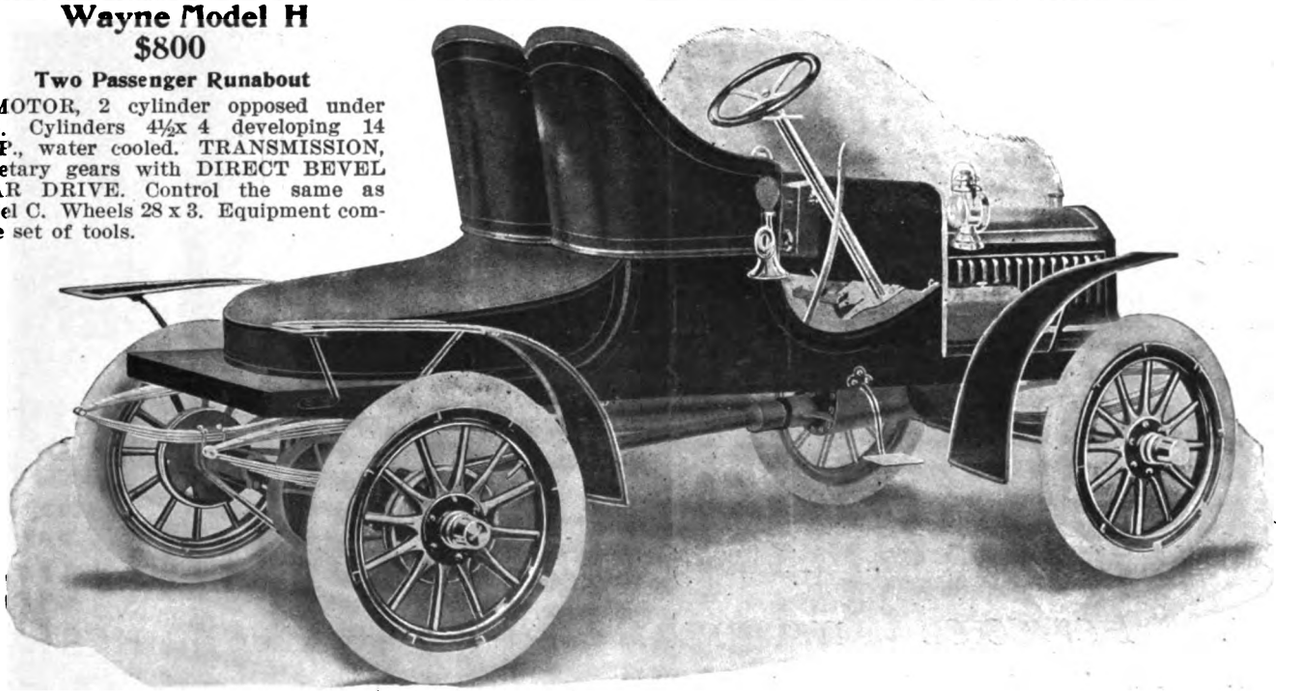
The appreciation accorded our cars last year warrants us in greatly increasing our capacity and in placing before the automobile trade improved types of Wayne cars. The four models we now present are the result of mature experience. They are not new and untried experiments. Each car is a distinct type of Wayne design and construction and each model has been built with a view to supplying the varied demand for high grade machines. In the Wayne cars of 1906 the automobilist will be sure to find a car suited to his needs.

Wayne Model F $3500

MOTOR, 4 cylinder vertical, cylinders 5½ x 5 cast in pairs. Cylinders and pistons ground. Engine develops by brake test 50 H. P. Water Cooled. IGNITION, jump spark with quad coil and storage battery. TRANSMISSION, sliding gear with three speeds forward and reverse. Hess-Bright ball bearings throughout. REAR AXLE, shaft drive floating type. FRONT AXLE, 1 beam drop forged, one piece, nickel steel. WHEEL BASE, 114 inches. TIRES, 34 x 4½. EQUIPMENT, includes all necessary tools of the best quality, 2 side lamps, acetylene head lights with generator, tail lamp and tube horn.

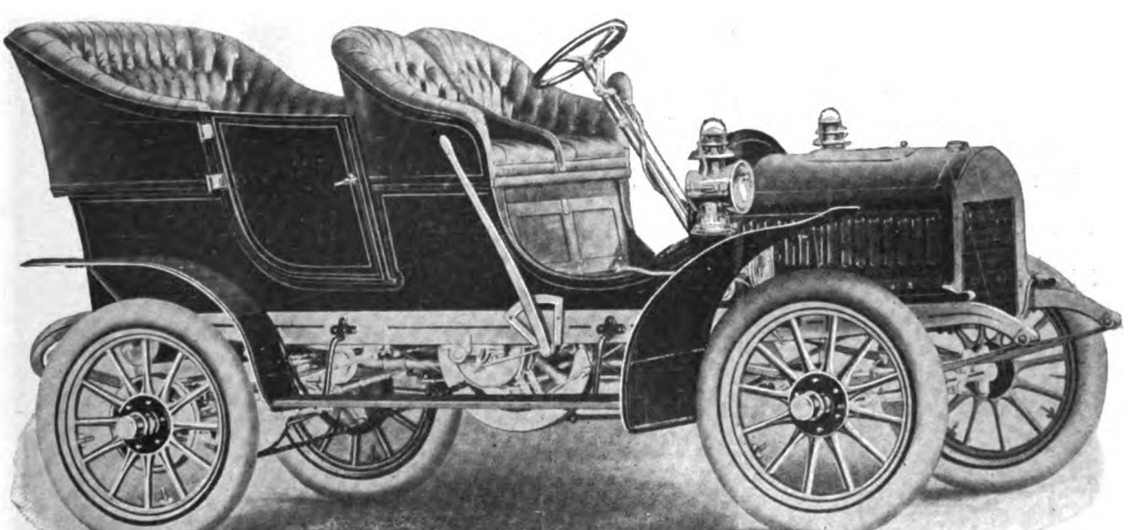
Wayne Model K $2500

MOTOR, 4 cylinder vertical, cylinders 4¾ x 5, cast in pairs and water cooled. Engine develops by brake test 35 H. P. Cylinders and pistons ground. IGNITION, same as Model F. TRANSMISSION and axles same type as Model F. TIRES, 32 x 4. EQUIPMENT, same as Model F.



Digitized by Google

Wayne



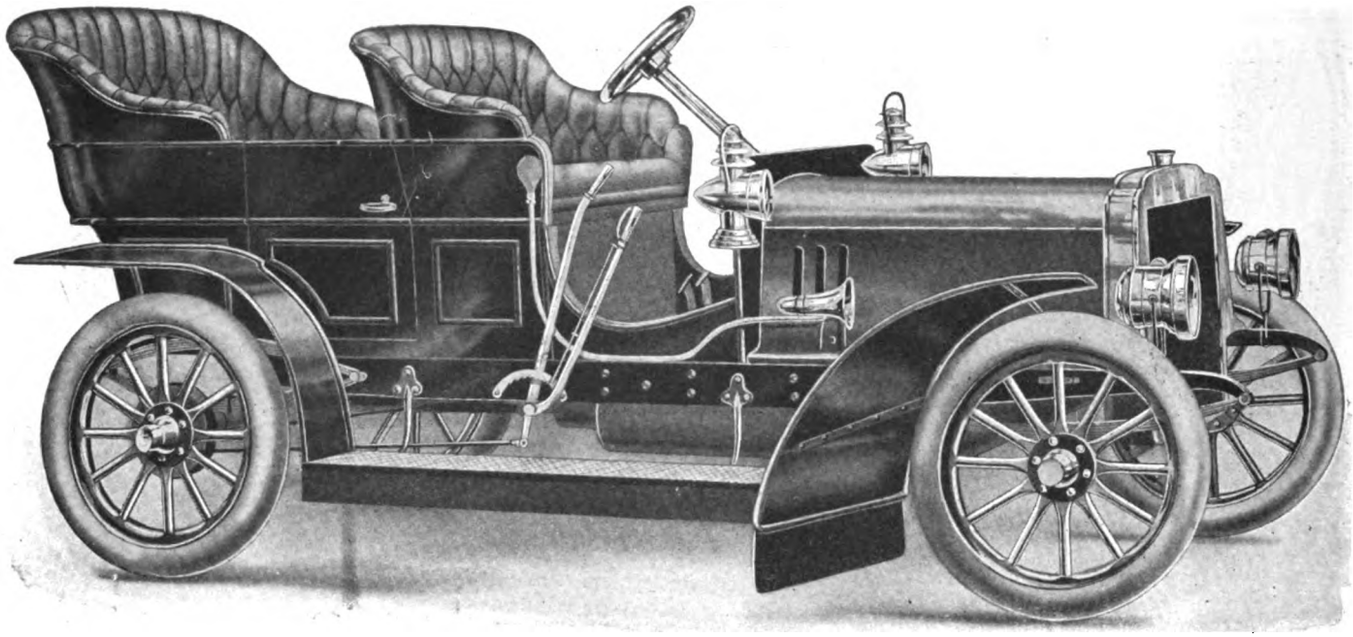
Wayne Model H
$800

Two Passenger Runabout

MOTOR, 2 cylinder opposed under hood. Cylinders 4½x 4 developing 14 H. P., water cooled. TRANSMISSION, planetary gears with DIRECT BEVEL GEAR DRIVE. Control the same as Model C. Wheels 28 x 3. Equipment complete set of tools.

The strong features of this car are the extreme simplicity and acessibility of the engine and transmission. The crank case and transmission case form one casting and the entire engine can be taken apart or assembled in half an hour.

Wayne Model C $1250



MOTOR, double opposed, of the standard Wayne type, with cylinders 5¼ x 5. Engine is hung under chassis frame and develops by brake test 20 H. P. *This is the same type of car which proved so successful last season, brought up to date and with all new improvements.* TRANSMISSION, is of the planetary gear type with chain drive. CONTROL is by a single lever which engages the high speed clutch and reverse. The slow speed and brake are controlled by foot pedals. TIRES 30 x 3½. EQUIPMENT, complete set of tools, side oil lamps, tail lamp and horn.

We want agents to write us about the Wayne cars for 1906. Agency arrangements can now be made for unoccupied territory. Write while you think about it, for full particulars.

1906 Ford 6 Cylinder Touring Car Price $2,500

6 cylinders 40 h. p. 4 to 50 miles per hour on high gear. *Perfected* magneto ignition—mechanical oiler, 114 inch wheel base, luxurious body for five passengers, weight 2000 pounds.

1906 Ford Runabout is as advanced as our touring car in design and even more surprising in price—will be fully illustrated and described early in December.

Both these Cars on exhibition at the New York Automobile Show.

THE NEW THOMAS

Greatly Exceeds My Most Sanguine Expectations.

EXPERTS SAY IT IS A WONDER.

No customer is so critical or hard to please as the manufacturer, who, regardless of cost, absolutely determines to do his utmost to build the best Car in the world.

But, when an ordinary Stock Touring Car, without special preparation or intention, runs sixty miles an hour on the level and climbs a 10 per cent. grade on the high speed at forty miles per hour, within an hour after it first leaves the shop, it is something that not one Car in a thousand will do.

Under favorable conditions, we should do sixty-five miles an hour.

I am more pleased than ever with its speed, hill climbing, quiet operations and mechanical superiority, and cordially urge disinterested Automobile experts everywhere to rigidly investigate our claims and compare our material, workmanship and design with the highest priced Cars in the world—and we will win the verdict.

Mr. C. E. Miller,
#96 Reade Str.,
New York.

Dear Sir:-

I wish to write you regarding the Brampton chains which I purchased for my Franklin car.

No. 1 I have used all the time and have given it about as hard a pull as it is possible for a chair to receive. All over the mountains of Orange County, New York, and between New York, Philadelphia and Lakewood until I am tired of the road.

The long chain on the Franklin is a pretty stiff proposition and many, in fact, most of my friends state that their first trouble on that car is that chain breaks and I have met people who have worked for hours to get their chain fixed on the road, but I have never met a Brampton in trouble and mine so far has not a scratch on it.

No. 2 is in the paper in which your salesman wrapped it for me, and is resting in the bottom of the car waiting for No. 1 to break.

My partner, Mr. Wilmarth, President of the L. I. Automobile Club, has a Brampton on his Winton and has had practically the same result as myself. He got me in line for the Brampton and there I stay.

Very truly yours,

H. S. M. - G.

An Investigation of GOODRICH TIRES

Mr. E. Shirts, cashier of the Citizens National Bank, Noblesville, Ind., after using a set of Goodrich Tires through the year 1904 and all of 1905 up to date, without a repair of any kind, decided to take off the tires for examination just to satisfy his curiosity. All he found was Goodrich Rubber and Goodrich Fabric perfectly united and looking just as good as new. His letter:

"In the spring of 1904 I purchased a Cadillac automobile, Model B, equipped with Goodrich Tires 3 in. x 30 in. I used those tires all the season of 1904 and all of this season without a repair of any kind, not a single puncture, and the tires look as good as new with the exception that the treads are flattened down some. I have had such remarkable success with them that a few weeks ago I took the front ones off to see what they were made of, and I found them in perfect condition, not even rim-rusted.

I have driven my car every day that was fit to be out with my family and have kept them busy both seasons and my experience with them has been one round of pleasure."

THE BAILEY "WON'T SLIP TIRE." Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.

Rims branded in the channel with this copyright mark have been ispected and pronounced perfect. We guarantee our tires only on rims so branded.

The Incomparable WHITE

The Car for Service.

Above is shown the chassis of the Model "F" White car which we are now delivering with touring car, runabout, limousine, victoria and landaulet bodies.

Steam power as utilized in the White car, possesses unique advantages. There is absolutely no noise, no odor, no vibration and the speed of the car is controlled entirely by throttle. There is an ever-present reserve of power which is often found most useful.

The White steam generator is totally unlike any other steam-making devise ever designed. To illustrate the radical difference, we might point out that in our generator the water is at the top and the steam at the bottom. In every other type of boiler, the steam is at the top and the water at the bottom. The safety, simplicity and reliability of the system is demonstrated by the performance of the thousands of White cars now in use.

The Expected Revolutien Has Come!

If you can think of a good reason for buying twice the machinery you need in a touring car and paying twice the expense for its upkeep, then you have found he only good reason why you should ***not*** buy an

Elmore

You certainly do not want four cylinders if two cylinders will do the same work and produce the same power—and that is precisely the extraordinary efficiency furnished by the ***two*** cycle two cylinder Elmore engine.

Understand—the ***two*** cycle two cylinder Elmore engine produces ***two impulses every time the fly-wheel turns.***

As you know, the two cylinder ***four*** cycle furnishes only ***one*** impulse every ***fourth*** time the fly-wheel turns.

In other words, the revolution which you have been expecting in automobile construction has come—and the perfect engine is here.

You'll realize quick as a flash when you look into the matter that the two cycle engine is a giant stride in advance—and that to cling to the four cycle in the face of the two cycle triumph is to take a step backward. Lose no time n finding out all about this remarkable mechanical achievement. Send for the technical description, stories of the conclusive tests, opinions of agents and users—the history of a tremendous success which has reached ts climax this season after five years of steady improvement.

The Oldsmobile Palace Touring Car, Model "S," price, $2,250, detailed description of which appeared in this publication last week, is notable equally for its carefully proportioned body, its strong, simple and well-balanced chassis and the wonderful attention to detail evident in every part of its construction. The car is low hung, yet has plenty of clearance, and the long wheel base of 106 inches gives a rangy appearance, which is most attractive. The four-cylinder vertical water-cooled motor is of the most thoroughly approved type, and easily develops from 24 to 26 h. p. The tendency to create dust is lessened by the construction of the dust pan and longitudinal arrangement of all parts hung beneath the car, all of which is conducive to general comfort in touring. The transmission is sliding gear, 3 speeds forward and reverse. The control is of the selective type, the changes being made with a single lever. The brakes are very strong and positive in action. The transmission brake is operated by a foot lever, while the rear hub brakes are controlled by a hand lever. Complete equipment, consisting of two acetylene head lights and generator, two oil lamps and one oil tail lamp, together with tools, etc., is furnished with this car.

Rambler Cars of steady service for 1906

IN SELECTING our line for the coming season it was early decided that Surreys, Types One and Two, were beyond any question of retirement and that but few improvements were possible. Therefore, these models with some slight alterations will be continued. To these are added Type Three, which is practically an elaboration of Type One, the power plant and chassis remaining the same, except somewhat lengthened to accommodate a larger and longer body.

These models are equipped with the tried and proven Rambler power plant, comprising our double opposed motor and planetary pattern transmitting gear, and are too well known to the trade and public to require extended description at this time.

Prices: Type One $1,200, Type Two, $1,650, Type Three $1,350, all with full equipment of lamps, horns, tools, etc.

"The Latest of the Ramblers," the strictly 1906 product, comprises four models. Model fourteen is a modern medium weight touring car equipped with a four-cylinder vertical motor 20-25 horse power, with sliding type transmitting gear, giving three forward speeds and reverse.

Final drive is by propeller shaft and bevel gear to the differential on the rear axle.

A notable feature is the method of connecting and bracing this shaft in which the universal joint is at the forward end and is entirely enclosed, running in an oil bath.

The external design is along most modern lines with a wheel base of 106 inches.

The selling price of this model is $1,750 with complete equipmnet.

Model Fifteen is a heavier car with similar but more powerful equipment, the motor being 35-40 horse power and the final drive by individual chain to each rear wheel. The body is practically the same as in Type Fourteen but longer and larger, the wheel base being 112 inches. Price, $2,500.

Model Sixteen is a most luxuriously appointed Limousine on the Model Fifteen chassis, selling at $3,500.

The Rambler runabout for 1906 is a fitting heir to the reputation gained by the earlier Ramblers of this type. It is equipped with a double opposed motor of 10-12 horse power, placed longitudinally in the frame and driving through the Rambler planetary gear. As a Runabout with 3 inch tires it will sell at $800 and with detachable tonneau and 3 1-2 inch tires at $950.

Catalogue and full descriptive matter will be mailed upon request, but a careful personal examination of these cars at our various branches and agencies, will convince you that whatever may be your requirement, in service or price, the Rambler is the car you need.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume XI. New York, U. S. A., Thursday, November 23, 1905. No. 9

CADILLAC FIXES FIGURES

Long Awaited Prices Finally Announced—Runabout Reduced and a "Special" is Added.

The prices of the Cadillac cars for 1906, concerning which there has been no little speculation, were settled this week. There is nothing sensational, however, about the new figures. The 10 horsepower single cylinder runabout, which this year listed at $850, and which proved the biggest seller in the trade, has been reduced to $750; when fitted with a tonneau, however, the old price, $950, will prevail.

Of the new four cylinder line, the 30 horsepower model, designed to carry four passengers, will sell for $2,500, and the 40 horsepower model, for six passengers, for $3,500.

In addition, it has developed that the Cadillac Motor Car Co. will also build, to order only, a four cylinder 30 horsepower runabout, for two passengers, the price of which will be $2,400.

The four cylinder models are said to have "assimilated" all the good features that made the runabout such a remarkable seller, and also to embody a number of original points that are in keeping with them.

Insurance Ban is Partly Lifted.

Unexpectedly some of the insurance companies have "come down" from their stand which caused a majority of the New York dock owners or lessees to prohibit the use of motor wagons on their properties. They have added a "rider" to their policies permitting the use of motor vehicles of whatever nature, assuming the risk without extra charge. As one of the docks thus "liberated" is used chiefly by cotton carrying boats, it would seem that there is now no good reason why the ban should not be entirely lifted.

Three More Join the M. & A. M.

The William Cramp & Sons' Ship and Engine Building Co., Philadelphia, whose manganese bronze automobile castings, coupled with their big reputation, gave them immediate standing in the automobile trade, have been elected to membership in The Motor and Accessory Manufacturers. O. W. Young, Newark, N. J., and the Nungesser Electric Battery Co., Cleveland, Ohio, also have been added to the roll.

Matheson Makes It a Million.

The Matheson Motor Car Co., of Holyoke, Mass., which will shortly move into its new factory at Wilkes-Barre, Pa., has increased its capital to $1,000,000 and taken out its papers under the laws of Pennsylvania. Of the stock $400,000 is preferred, of which $141,180 is paid in, and $700,000 is common, of which $416,000 is paid in. The corporators named are C. W. Matheson, F. F. Matheson, of Holyoke, Mass.; C. U. Clark, Grand Rapids, Mich; J. F. Mueller and F. A. Hinchman, Detroit, Mich.

Parkersburg Tempts Oscar Lear.

An effort is being made by the Parkersburg (W. Va.) Board of Trade to induce the Oscar Lear Automobile Co. to move its plant from Columbus, Ohio, to that city. Parkersburg has offered the company ten acres of ground with good shipping facilities, will construct a brick factory building 150x300 feet, with concrete floors, and also will take stock in a company if additional capital is needed.

Commercial Car Plant for Packard.

The Packard Motor Car Co. last week purchased a tract of six acres adjoining their present plant in Detroit, thereby exactly doubling their site. On the newly acquired ground, it is the Packard people's intention to erect a factory for the exclusive manufacture of their commercial vehicles.

Buick Invades New York.

The H. J. Koehler Co., Newark, N. J., which has had general oversight of the Buick interests in this part of the country, has opened a Buick branch in New York at Fifty-first street and Broadway. Incidentally, the Buick people will add to their line a four-cylinder car of 35 horsepower.

Abandon Their Low-Priced Runab ut.

The American Motor Co., Brockton, Mass., who about a year since undertook to build a popular priced runabout, have ceased endeavors in that direction. They will stick to their original business, the manufacture of motor bicycles.

WHO'LL BE IN THE ARMORY

A. C. A. Makes its Showing of Hands—Few of the "Independents" are Missing.

Although the allotments of space have been made for the Automobile Club of America's show in the 69th Regiment Armory, New York, they probably will not be made public until after the 1st proximo. As always, some shifting will be made, and the task of allotment really will not be accomplished until this is done. Those who have secured space, however, are as follows:

Main Floor.

White Sewing Machine Co., Thos B. Jeffery & Co., Baker Motor Vehicle Co., Grout Bros. Automobile Co., Lane Motor Vehicle Co., Pungs-Finch Co., Lozier Motor Co.

Palais De L'Automobile (H. Neubauer), E. W. Sutphen (English Daimler), Daimler Mfg. Co., Renault Freres Agency, Inc.; Panhard & Levassor, Mors Automobile Co., Gobron-Brille (Henry F. The Week's Incorporations.

New York City, N. Y.—Leon Rubay, under New York laws, with $25,000 capital; to deal in automobiles and supplies. Corporators—Leon Rubay, C. N. Pitcher and H. J. Hinley.

Newark, N. J.—Roseville Motor Co., under New Jersey laws, with $25,000 capital; to make motor vehicles, engines, etc. Corporators—Ernest U. Mott, Henry Setlow and George M. Barnes.

Providence, R. I.—C. D. Snow Co., under Rhode Island laws, with $25,000 capital; to conduct a general automobile business. Corporators—Calvin D. Snow, Horace N. Williams and Minnie L. Snow.

Wilkes-Barre, Pa.—Matheson Motor Car Co., under Pennsylvania laws, with $1,100,000 capital. Directors—C. W. Matheson, F. F. Matheson, C. U. Clark, F. Miller and F. A. Hinchman.

Newark, N. J.—Newark Garage & Repair Co., under New Jersey laws, with $10,000 capital; to manufacture, store, repair and sell automobiles. Corporators—George Paddock, Leonard B. Zusi and Andrew Schwind.

New York City, N. Y.—William E. Kleine & Co., under New York laws, with $25,000 capital; to manufacture wheels, shafts and spokes for all kinds of vehicles. Corporators—William E. Kleine, Josephine E. Kleine and Louis P. Alheim.

Miami, Fla.—Miami Transfer Co., under Florida laws, with $50,000 capital; to conduct an automobile stage line. Corporators and officers—President, James T. Brundage; vice-president and general manager, J. M. Hanley; secretary-treasurer, S. L. Patterson.

Miami, Fla.—Miami Automobile Co., under Florida laws, with $10,000 capital; to deal in automobiles and conduct a stage line. Corporators and officers—President, W. A. Lofton; vice-president and treasurer, R. B. Einig; secretary, M. K. Whitten.

In the Retail World.

L. Gorham Harrison has taken the agency in Boone, Stephenson and Winnebago counties, Illinois, for the Stevens-Duryea cars. He will locate in Rockford.

Owing to the stress of other business, C. H. Torrey has resigned the Knox agency in New Haven, Conn. He has been succeeded by E. T. Hale, 166 St. John street.

James F. Smith, a Springfield (Ill.) dealer, has closed the doors of his establishment at No. 411 East Washington street. His liabilities are $5,851.60 and his assets, $1,156.60.

Thomas A. Egan and F. G. Grinnell, of Narragansett Pier, R. I., will establish a garage in connection with the Clarendon Hotel at Sea Breeze, Fla. The resort is on the Ormond-Daytona beach.

Peter C. Rutan, of Port Jervis, N. Y., is building a one story concrete garage, 30x100 feet at Middletown, N. Y., ground having been broken last week. Rutan is handling that Cadillac car.

Fire in the Caswell garage on Moody street, Lowell, Mass., on Thursday of last week did damage to the extent of about $15,000. Several valuable touring cars, some of which were insured, were destroyed. It is thought the fire started in the repair shop, but the cause is not ascribed.

Corning, N. Y., is to have its first garage when the contemplated building of the Crystal City Cycle Co. is completed. It will be of concrete, one story high, and its dimensions 42x70 feet. A stock company, the Corning Automobile Co., with George Wolcott at its head, will probably be formed.

Garnett Zorn, John M. Strauss and Harry A. Volz have taken over the business of the Simpson-Strauss Automobile Co., No. 518 to 522 Third street, Louisville, Ky., Lee Simpson retiring, and will reorganize the Zorn-Strauss Co., Inc. In addition to the Pierce and Franklin lines, the new company will handle the Stevens-Duryea.

George M. Tinker, of Waltham, Mass., and Charles L. Tinker, of Boston, doing business in the latter city under the firm name of Tinker Bros., automobile repairers, at No. 247 Columbus avenue, have filed a voluntary petition in bankruptcy. Their liabilities amount to $5,957, of which $281 is secured. There are about eighty unsecured creditors. The assets are estimated at $3,386.

Changes in the Detroit Trade.

Jefferson avenue, on which the automobile colony of Detroit is located, has recently been the scene of a good many changes. Young & Miller, Elmore agents, who did much to popularize the sale of elmore cars, have been succeeded by the Lee-Bock Auto Garage.

Charles Grant, manager of the Ford Motor Co.'s local branch, has resigned and will go into business on his own account. It is reported that he has secured the agency of the Buick car.

The Seidler-Miner Co. is no longer to have the local agency of the Queen line, which will be hereafter handled from a salesroom which is being fitted up at the factory of the Blomstrom Motor Co.

Harry Cunningham, manager of the Detroit Automobile Co., the Winton-Franklin agents, has resigned to take the management of the Ford Motor Co.'s new branch at Cleveland, Ohio. This will be located on Euclid avenue.

E. McMasters, who resigned the management of the Detroit branch of the Hartford Rubber Works Co. to accept a similar position with the Firestone Tire & Rubber Co., has been succeeded by Fields, who comes from the Denver branch of the Hartford concern.

The Maxwell-Briscoe-McLeod Co. is the title of a new concern which will act as the distributing point for Maxwell cars in several States. They have leased the building hitherto occupied by the Oldsmobile Co., of Detroit, on Michigan avenue. They expect to carry a full stock and everything necessary to properly handle a large business.

CHICAGO GETS MORE ROOM

Secures an Armory and thus obtain Needed Show Space—Those who are Booked.

Chicago finally has found space for all those who desire to exhibit at its show in February next. The Coliseum was not large enough to house all of them, and the manager was hard put to it. No amount of cramping helped matters, and it seemed that some twenty manufacturers of cars must be crowded out, when he hit upon the securing the 1st Regiment Armory, which is connected with the Coliseum by an asphalted alley about 300 yards long. He promptly secured it and thus obtained 20,000 additional feet of floor space.

The asphalted alley will be thoroughly cleansed, lighted and decorated, and an effort will be made to cover it. The appointments at the armory will be the same, in every detail, as those at the Colisum. A duplicate set of tickets will be issued, so that the public will be admitted to both buildings for one admission fee.

As a further guarantee that the armory will be made of at least as great importance as the Coliseum, agents' passes, good for both buildings, will be issued at the armory only, railroad tickets will be signed there and all conventions which are to take place during the week will be held in that building.

The allotments of space have been made, but until the acceptances have been received they will not be made public. The makers of cars who have been taken care of are as follows:

In the Coliseum.

Packard Motor Car Co., Elmore Mfg. Co., E. R. Thomas Motor Co., Olds Motor Works, Haynes Automobile Co., Locomobile Co of America, National Motor Vehicle Co, Electric Vehicle Co., Pope Motor Car Co., Pope Mfg. Co., Woods Motor Vehicle Co., Winton Motor Carriage Co., T. B. Jeffery & Co., Peerless Motor Car Co., Knox Automobile Co., F. B. Stearns Co., Studebaker Automobile Co., J. Stevens Arms and Tool Co., Autocar Co., George N. Pierce Co., White Sewing Machine Co., St. Louis Motor Carriage Co., Apperson Bros. Automobile Co., Royal Motor Car Co., H. H. Franklin Mfg. Co., Northern Mfg. Co., Cadillac Automobile Co.

Ford Motor Co., Premier Motor Mfg. Co., Reliance Motor Car Co., Baker Motor Vehicle Co., Wayne Automobile Co., Duryea Power Co., Buick Motor Co., Waltham Mfg. Co., Corbin Motor Vehicle Corporation, Vehicle Equipment Co., Chicago Automobile Co., Bartholomew Co., Tincher Motor Car Co., Auburn Automobile Co., Jackson Automobile Co., Austin Automobile Co., Pungs-Finch Automobile and Gas Engine Co., Dayton Motor Vehicle Co., Model Gas Engine Co., Pierce Engine Co., Holsman Automobile Co.

In the Armory.

Welch Motor Car Co., Monarch Automobile Co., Lozier Motor Co., Acme Motor Co Adams Co., Blomstrom Motor Works, Wolverine Automobile Co., Reo Motor Car Co., Maxwell-Briscoe Co., Buffalo Electric Carriage Co., Marion Motor Car Co., Rapid Motor Vehicle Co., Moline Automobile Co., Dolson & Sons Co., C. P. Kimball & Co., Cleveland Automobile Co., Oscar Lear Automobile Co., Synnestvedt Machine Co., Wayne Works.

Rainier Bros., Western Automobile Co., Berkshire Automobile Co., Logan Construction Co., Detroit Automobile Co., Kansas City Automobile Co., J. W. Moon Buggy Co., Buckeye Automobile Co., Knight & Kilbourne, McCrea Truck Co., Smith & Mabley, Inc.; Panhard & Levassor (Ralph Temple), H. S. Michaels Co., Automobile Importing Co.

Sues for an Accounting.

Alfred O. Dunk, Edith W. Dunk, Robert C. Yates and Louise M. Yates, stockholders in the Detroit Novelty Machine Co., which was recently taken over by the Detroit Auto Vehicle Co., have brought suit against the latter concern to compel an accounting. The plaintiffs affirm that under the terms of the agreement the automobile company was to pay $2,500 for the novelty concern and was to issue $500 in stock to Robert Yates. Another allegation is that the purchasing company was to collect the outstanding accounts and issue stock to the stockholders of the Detroit Novelty Machine Co. for the amount collected, but have failed to say what money has been taken in and have refused to issue the stock. On these grounds an accounting is asked. The plaintiffs also allege that outstanding indebtedness to the amount of $10,572 was compromised for $7,000, and ask that they be paid the difference, claiming that they may be held liable.

Billings not to Build Cars.

The report that F. C. Billings, of the Billings & Spencer Co., Hartford, Conn., was concerned in the formation of a company to manufacture an automobile of his own design, is an overstatement of the case. He harbors no intentions of the sort. He did build a gasolene car for his own use, and its behavior has been such as to attract the attention of some men of means. They have coquetted with Mr. Billings, and he has not proven averse to the flirtation. If they desire to buy he is not disinclined to sell—and that is all there is to the story.

Queer Suit for False Arrest.

Charles S. Simanton, a jeweller of St. Johnsbury, Vt., thinks $10,000 the proper lotion for his injured feelings at being, it is alleged, arrested falsely, and has accordingly asked that amount in damages in a suit he has brought against Oscar Brambach, of Wshington, N. J. Some time ago Simanton purchased an automobile of George M. Depue, of Washington. The latter claims he had reason to think that Simanton was trying to leave the State without paying for the machine he had been operating for nearly a month. Depue then sold the machine to Oscar Brambach, and the new owner and Depue had an exciting chase at midnight after Simanton. The latter was arrested at Newton, and it was claimed by his pursuers that he was attempting to leave the State, having gone in the direction of the New York State line after leaving Hackettstown, where, it is said, he had agreed to leave the machine.

Philadelphia Dealers Join Hands.

Quite fittingly, brotherly love now pervades the automobile trade in Philadelphia. The lions and the lambs lay down together on Tuesday night last at a meeting in Hotel Hanover, when the Philadelphia Automobile Trades Association and the younger Philadelphia Automobile Association amalgamated under the former title. This gives the organization a membership of nineteen actives and five associates. All will now pitch into the promotion of the annual show. The officers of the older organization will hold over until the annual election on December 2.

Typewriter Concern may make Cars.

Manufacturers of many classes of machinery are casting an envious eye on the automobile as an adjunct to the profit producing capacity of their plants, some of them having already undertaken the building of cars. The latest rumor of this kind concerns the Smith Premier Typewriter Co., of Syracuse, New York, which, it is said, will add this feature to its business during the coming year.

New Men on Autocar.

Follolwing the resignation of John C. Spiers as general manager of the Autocar Co., Ardmore, Pa., John Calder has been appointed general engineer and A. L. Goddard superintendent of the company. Both were formerly connected with the Remington Arms Co., Ilion, N. Y. M. I. Brock, of course, remains sales manager of the Autocar Co.

Buffalo Fixes Show Dates.

March 4 to 10 is the date set for the fourth annual Buffalo show, if sanction, application for which has already been made, is granted to the Buffalo Automobile Trade Association. As usual, it will be held in Convention Hall, with David H. Lewis as manager.

Shawmut Succeeds Phelps.

The Shawmut Motor Co. has succeeded the Phelps Motor Car Co., Stoneham, Mass. Mr. Phelps had previously retired from the company that bore his name.

Autocar Sets its Prices.

The Autocar Co., Ardmore, Pa., has fixed $2,600 as the price of their 1906 24 horsepower touring car. The 12 horsepower runabout will list at $1,000.

DO YOU SELL AUTOMOBILES?

Most discriminating drivers now use

THE FISK
MECHANICALLY FASTENED TIRES

but the man who has yet to try them will also appreciate your good judgment in equipping his car with them.

The sense of security and full comfort that users of Fisk Tires experience will go far towards making your selection of such an equipment a lasting advertisement.

The long service they render—the comfort they insure—and the amount of time, energy, and money they save make their use worth while.

CADILLAC DEPENDABILITY

JOHN W. MOUNT & BRO.,
Manufacturers and Dealers,
CARRIAGES AND AUTOMOBILES.

RED BANK, N. J., November 13th, 1905.

THE CADILLAC MOTOR CAR CO., Detroit, Mich.

GENTLEMEN:—I think you are entitled to know of the good work the single cylinder touring car that I have been running this summer has done. It has never failed to take me wherever I have started to go, and have run it almost 3,000 miles since July. It always comes back stronger and seemingly with more power than when starting out.

One of the interesting runs I made was to Atlantic City, a distance of 106 miles from here. Made the run in 5 hours, each way, without having to make a stop for anything and the whole run of 212 miles on 10 gallons of gasoline and less than a cup of oil.

Another run from here to Trenton, 45 miles in two hours, speaks well for a car of this power.

These trips were made with four people in car, up and down hills and slacking up while going through towns.

I think there is more real pleasure and less trouble embodied in the little single cylinder touring car than any car built, regardless of cost.

This car that I have been running and described is only what all the other cars of this type we ave sold have done.

Wishing you all success, I am, yours respectfully,

(Signed) JOHN H. MOUNT, of the firm of J. W. MOUNT &BRO.

'NUF SAID.

THE MOTOR WORLD

Published Every Thursday by

THE MOTOR WORLD PUBLISHING COMPANY

154 Nassau Street,

NEW YORK, N. Y.

TELEPHONE, 2652 JOHN.

Subscription, Per Annum (Postage Paid) $2.00
Single Copies (Postage Paid) . . . 10 Cents
Foreign Subscription $4.00

Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to THE MOTOR WORLD PUBLISHING COMPANY.

General Agents: The American News Co., New York City, and its branches.

☞Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

☞Those who are interested in motor vehicles will find the facilities and information of our office always at their command.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, NOVEMBER 23, 1905.

Fewer Laws, More Light Needed.

In advance of definite knowledge of the provisions of the mysterious bill which President Morris states the Automobile Club of America will have introduced into the New York Legislature, comment may be unfair. But, generally speaking, it is regrettable that any effort to tilt at the legislative windmill is again to be made. It is very much like reopening an old sore, and it well may be doubted that any lasting good will result. When a wound is healing the best thing to do is to let it heal.

If the Automobile Club of America or any other club or organization desires to perform a public service which will redound to the safety of road travel of whatever sort, they should apply themselves to that legislation which makes for the universal use of lamps. It is legislation that is sorely needed and long overdue. Of course, the average man who uses the road will not welcome with open arms a law of the sort. Generally speaking, he is quite ready and even anxious that the "other fellow" shall display lights, but he himself dislikes to buy or to bother with them. This attitude does not, however, affect the merit of the law. There can be no two minds that the display of lights on each and every vehicle that uses the public roads makes for the safety of all who use them. It is a consideration really due from one man to the other, and if they will not realize it, they should be forced to do so.

The automobile interests can well afford to father such a measure and to earnestly advocate it. They already display lights, and in view of the hue and cry about making the roads safe from the "automobile peril," their advocacy of "uinversal lamps" will prove their sincerity in the matter, as it will serve to illuminate the insincerity of most of those who cry out for safety. It will throw the farmer element and most of the other elements on the defensive, and that is half the battle. It will also make easier any other purposes the automobilists would have served.

Concerning Chasses.

There will be seen at the shows during the coming winter a type of motor car chassis which, though not new, strictly speaking, will yet be for the first time sufficiently in evidence to be classified as a type by itself. This, for want of a better name, may be termed the commercial type of chassis, and though it may not become numerous before another year has rolled by, yet seems destined to become a very prevalent form of running gear sooner or later.

This type is being evolved in two distinct and different ways, each of which, independently of the other, is approaching the same result. It has all the general characteristics of the common and sometimes called "Continental" type, in so far as the wheel base, suspension and driving gear are concerned, and is not particularly to be distinguished from it as to the transmission and motor, except that they are placed considerably lower down than is common practice at present, and that the motor is located considerably further back from the front axle than at present.

In the field of the commercial vehicle, as designed for heavy duty, this type of chassis has been produced in an effort to secure as much space in the clear for the load as possible, as a result of which the driver's seat has been brought forward of the motor and placed above it. This has necessitated the lowering of the motor to a certain extent, and the rearrangement of the steering gear and control mechanism to correspond. Thus, though many of the commercial trucks and lorries seen at the present time still retain the motor in the position which touring car design has assigned to it, by far the greater number, following the example set by the early Panhard and Daimler vehicles, are of the type described.

On the other hand, the design of the pleasure type of vehicle has wrought out another type, from the pattern of the horse drawn cab and the electric cab, in which the driver is seated at the front of the car and directly over the motor, which is constructed after the fashion of the touring car and is precisely like it except that it is lowered in the frame, with consequent loss in road clearance in some cases. The development of this type of car for pleasure use within city limits, or, more properly speaking, for passenger commercial uses has then arrived at the same result, practically speaking, which has been attained by the builders of the heavy commercial car.

At the time of the shows last year several machines of the latter order were shown as the work of the foreign makers, and during the year others have been produced. The great demand for a machine which will not be a radical departure in appearance from the types of vehicle in common use on the streets, and one in which there will be ample and unrestricted room for the body, has called forth this type of chassis. Whether or not it is better suited to the needs of the case than any other remains to be seen; but at all events the fact remains that it combines the excellent qualities of compactness, serviceability and convenience of access (through the removal of the driver's seat) with that of beauty, since it removes from sight all mechanical parts except the mechanism of control, and on that account would seem to be worthy of a place in the consideration of the maker.

Influence of Four Cylinders.

But a year ago belief that the four cylinder vertical engine represented a type that would witness a number of years' evolution in other parts of the car before itself giving way to change or addition was so general that it would have been difficult to find a dissenting opinion. Not that experiment had not already outgrown four as a number to conjure with, for six cylinder cars had then been built and were no longer a novelty. Theory and practice are usually so far apart that it is seldom economy to attempt to make them approach too closely. Now, so far as theory is concerned, the ideal engine should be one with a sufficient number of cylinders to give the

Digitized by Google

crank shaft turning impulses throughout its entire revolution.

Naturally this would mean duplication of parts to an extent entirely unwarranted by the result obtainable. Pioneer cars started with a single cylinder, but it was apparent at the outset that a single impulse every other revolution left the engine too long dead, or, rather, running on its acquired momentum for too great a time. The torque of such an engine cannot be otherwise than extremely irregular, particularly at low speeds, when the application of the load is apt to stop it. From this it was but a step to an additional cylinder, whether the resulting engine was placed horizontally with the cylinders opposed or vertically side by side, though the former was given preference for its balancing effect. But even two cylinders of a four-cycle motor mean but one impulse per revolution, and while this type of engine has held its own for low powered cars generally, it has not been found effective beyond a certain point.

Looking back on the last five years, it seems evident that much of the backwardness of the American builder was due to his blind faith in the single and two cylinder horizontal engine, while French designers would consider nothing less than four cylinders. It is not too much to say that it was not until the latter became a feature of the cars turned out on this side of the water that American cars generally began to be a credit to their creators. Since then the four cylinder vertical type of engine may well be said to have become universal for everything except light cars. Four cylinders of the four-cycle principle provide but two turning impulses per revolution, and thus still fall far short of the perfection represented by theory as already outlined. Nevertheless, they have been found to produce a very even torque, or pull, when run at comparatively high speeds, such as 1,000 r. p. m. or more, for which it has accordingly been found essential to design them. For every additional pair of cylinders it is possible to give the crank shaft an extra impulse per revolution. A thrust at every 120 degrees, or one-third of a turn, instead of 180 degrees, or every half turn, is the advantage represented by the six cylinder engine over its predecessor, and in the attempt to design a motor that shall have the maximum amount of flexibility is a considerable step forward.

What seemed a development of some uncertain time in the future has now come forth as a fact of the present, for at least one conspicuous American maker has announced a six cylinder car for 1906, several English firms have built cars of the same kind, and it is understood that some of them will make this type a feature of their regular line. More than this, one British builder will do likewise with an eight cylinder model, while six cylinder cars are expected to be prominent on the stands of the best known French builders at the Paris exhibition in December, so that for the time being at least it would appear that practice has made a step closer to theory by the addition of two cylinders. Whether this will be found to represent the point which economy makes it inexpedient to exceed, or whether still further additions to the number are necessary would appear to be in a fair way of solution during the coming year. Then there is, of course, the further possibility of a return to present standards as the result of experience with the new models during the same period.

Automobiles for Antarctic Exploration.

Pretty much everything else having been suggested as a certain means of reaching that spot on the earth's surface represented by the imaginary line known as 90 degrees north latitude—in other words, the North Pole—and many of them having been tried without success, an explorer has suggested the automobile, and to show the reasons for his faith in it has set before a scientific congress a carefully outlined plan for utilizing its services. He is M. Arctowski—whose name is not a joke—and he has intentions on the South Pole. It is his opinion that a specially constructed car fitted with spiked wheels and a few other usual accessories made necessary by the conditions to be encountered, would succeed in carrying an explorer further into the unknown frozen regions than any of the many methods hitherto employed.

All that part of it is merely detail, of course, and as technical information of the explorer's proposed car is not a matter of public knowledge at the moment, it is a waste of time to surmise what such a machine would be like, if ever it is built. But the fact of greatest interest conveyed by the announcement of the explorer's faith in the gasolene propelled machine to carry him into a region never before traversed by human agency lies in the tacit recognition of the capability of the automobile to overcome conditions hitherto found insurmountable by any other means. It shows that the automobile is already credited with having conquered all other things mundane in the way of transportation and is now seeking for new fields in which to display its ability to get there. It has shown itself to be the master of roads and the lack of them in every climate and in every portion of the globe; it roams the prairies, climbs the mountains, and has even conquered that waterless waste which has long been the terror of the Southwestern United States—Death Valley. The question no longer appears to be Where can the automobile go, nor Where cannot it go? for nothing short of a perpendicular wall seems sufficient to stop it.

Some one whose experience evidently has taught him a lesson advises the motorist to make it a practice always to write his name on the inside of outer covers of his tires and on inner tubes as well before sending them to be repaired. An indelible pencil is the proper things to mark them with, he says. Perhaps it was the same person who admonished the owner to be sure and borrow a set of batteries from the garage to which he had taken his own for recharging, and to insist upon retaining them until he had made sure that his own had not been tampered with during their sojourn there, and that they really had been charged according to instructions and not as a matter of fact simply been boosted up to show the required voltage on open circuit.

It was very nice of Highway Commissioner McClintock of Massachusetts to urge that the overspeeding automobilist be treated "squarely" and "like a man." But while there remains on the books of Massachusetts the law that permits the Highway Commissioner to revoke a citizen's right to use the public highway in a vehicle of his choosing and requires him to report the sale of his private property treatment of the sort is and will remain impossible. The Massachusetts law makes a privilege of an inherent and established right and presupposes that men who use motor vehicles are likely malefactors. They are by plain implication placed in the class with thugs, thieves and "fences."

Talk about reform! W. J. Morgan, who is to manage the Florida speed carnival, is objecting to cash prizes. Shades of Bill Tweed and Tammany Hall! Can this be truly the same Morgan who as a bicyclist barnstormed for cash practically all his life, and from one end of the world to the other? Can it be that he is managing the carnival for an "object de art," and not for the long sought, hard sought and much beloved and always sought "cash prize"? Won't some one please carry the news to Tom Eck and Jack Prince, and quickly?

MADE MOTOR CARS IN CELLAR

Insurance Inquiry Finds Graft in the Mutual's Basement—The Official Explanation.

Since the spectacular withdrawal of the curtain which hitherto has concealed the innermost workings of the insurance industry in the United States, for it is deserving of no less a title, there have been many startling disclosures. The investor has learned with no little surprise, and not a few misgivings, that his good ducats have been put to many uses other than those for which he intended them when he subscribed them for the benefit of posterity, and he also has learned that the business of insurance is in reality but the credit department of a gigantic syndicate for the promotion of commercial and manufacturing interests of most extraordinary breadth and variety. So that really he need not feel the least concern at the announcement that the Mutual Life has been conducting an automobile department (unofficial, like many another of its ventures) in the basement of its headquarters at No. 32 Nassau street.

In the light of certain facts which have been laid before the investigating committee, it appears that no less than ten machines have been constructed in the sub-cellar shop, where are plenty of modern appliances and tools wielded by the hands of skilled mechanics who are on the payroll of the company. The work was carried on under the expert supervision of Edward M. Irton, the Mutual's superintendent of buildings in the city, who is of a mechanical turn. The cars, about which there is a dearth of particulars, were built for the superintendent and his friends, among whom are Lysander W. Lawrence, the head of a company which supplies the Mutual's stationary, and Vice-President Fonda of the Mutual. Mr. Lawrence's car, after having been constructed in sectional form, like the Pinnace described in the "Swiss Family Robinson," was taken to the Lawrence stable and there set up like a Chinese puzzle.

One of those human ferrets which the great dailies employ for the purpose of discovering things which are of interest to people who are not supposed to know them, sought out the Mutual Automobile Factory one day early last week and met with considerable opposition at first. In the end, however, he was directed to the "works" by an elevator boy, only to be stopped by a watchman, through whose kind offices he was ultimately ushered into the presence of Mr. Irton himself. After some little fencing that worthy admitted that he had constructed several machines, but said that all work on them had been done by the Mutual employes after hours, and that the Mutual had not been called upon to bear any of the expense.

"Mr. Fonda, third vice-president of the company, knows all about this matter," he said. "He has known all along that I was doing this work in the basement, and he has never offered any objection to it."

Mr. Fonda, when seen later, said he did not see why there should be so much talk over such a matter. He continued:

"Why shouldn't a man enjoy some relaxation from the cares of business by doing a little job in mechanics once in a while? If he has a talent for building automobiles let him amuse himself in that way. If Mr. Irton had done anything wrong, how long do you suppose he would have remained an employe of the company?"

Detectives sent out by the investigating committee report that the scene of Mr. Irton's recreation is located on the Cedar street side of the building, and is approached through a laberynth of passages which alone are calculated to confuse the stranger and throw him off the track, and that, in addition, the way is blocked at various points by watchmen in the employ of the company, who bar the way to all who are unknown to them. Once in the shop, however, they found the frames and motors of two automobiles, together with sufficient parts for their completion. Several mechanics were at work there. The investigators also reported that they saw the same mechanics go to the company's cashier for their money on pay day, and that their names were afterward found to be upon the pay roll.

Olds in the Correspondence School.

The Correspondence School of Automobile Engineering, which, according to reports, "struck oil" in Akron, Ohio, has been removed to New York, where it is expected the field will prove even more fertile. Incidental to the change of address, the school has been reorganized on a more substantial basis than ever, and now is incorporated under the laws of the State of New York, with a capital of $30,000. R. E. Olds has succeeded A. J. Saalfield as president; R. M. Owen has become treasurer, in place of E. R. Adam, and Robert H. Montgomery is secretary, instead of G S. Rowe. Victor Lougheed will continue as vice-president and general manager.

Grout Sues Inventor Radford.

Grout Bros.' Automobile Co., Orange, Mass., have placed attachments and begun suit against H. I. Radford, to recover $2,292 in an action of contract. Radford developed some ideas and theories on automobiles at the expense of Grout Brothers, who claim that he owes them for labor and materials.

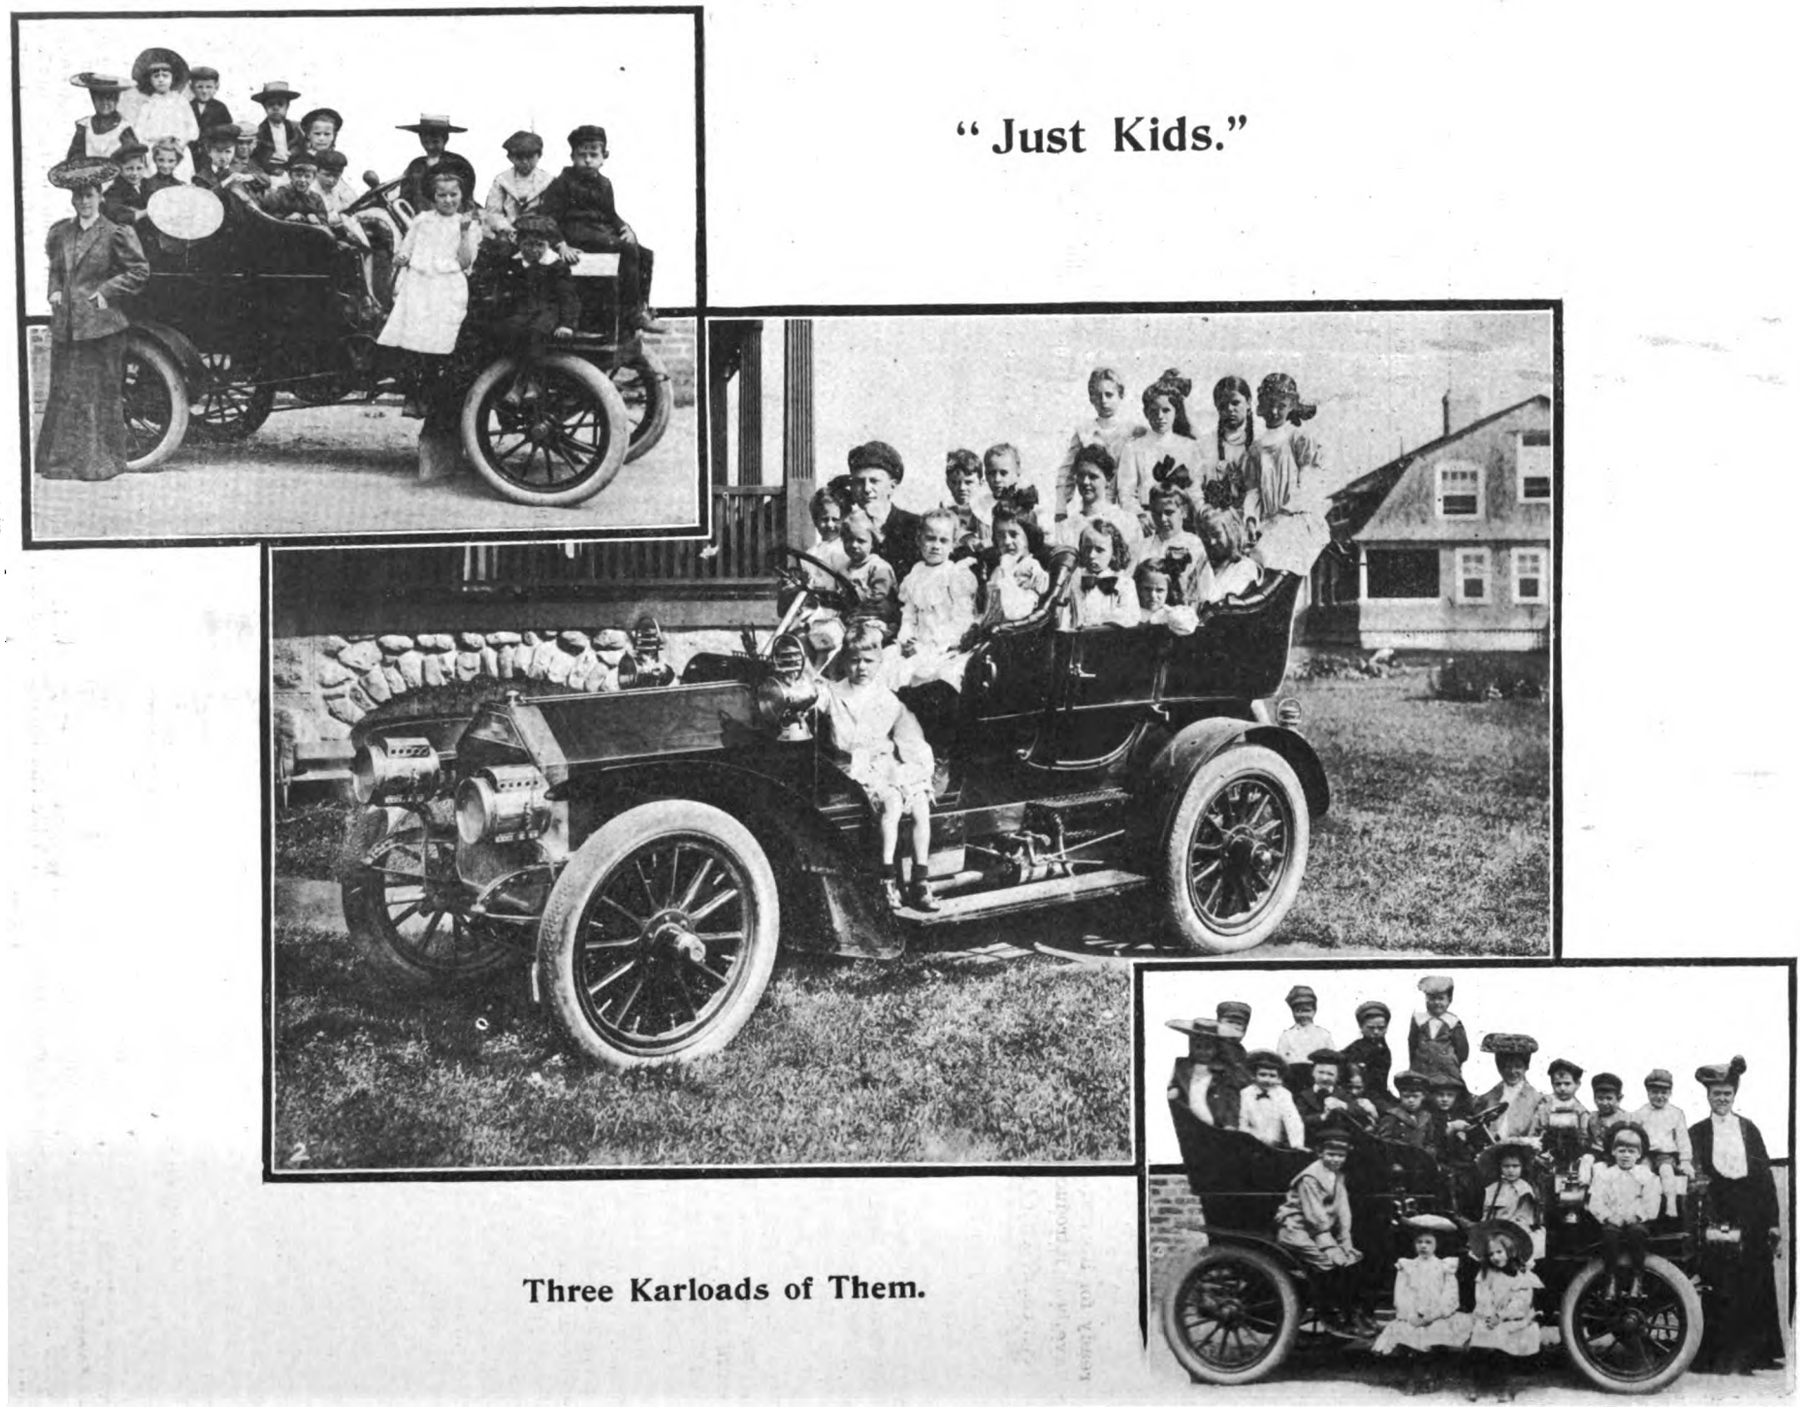
Not in the Automobile Business.

The Lee & Porter Mfg. Co., Buchanan, Mich., write that the report that they purposed engaging in the manufacture of automobile parts was due to a misunderstanding. They have no present intentions of the sort, and instead will confine themselves wholly to the production of carriage and wagon axles.

The Moline Automobile Co., Moline, Ill., is building a quarter-mile circular test track, on which to try out its new cars. It is twenty-two feet wide and banked three feet on the turns.

"LARGE TIME" AT LANSING

Olds Agents Gather There and obtain Instruction, also Some Ruralistic Surprises.



The Oldsmobile agents, more than a hundred of them, have left the factory at Lansing, Mich. If each of them did not learn all that is worth knowing about the new product, it is his own fault; if he fails to remember all of it and suffers from a confusion of memories, that is partly the fault of the Olds officials. They planned that their visitors should have reason to recall November 17 and 18, and they succeeded so admirably that the succession of events kept the minutes well crowded.

As they arrived, the agents from the different parts of the country were shown through the plant and the processes of manufacture explained. Then Chief Engineer Coffin took them in hand, and under his instructions the 1906 models were inspected and demonstrated. All the improvements and new features were pointed out and thoroughly explained. Thereafter the dealers had conferences with General Manager Smith and Sales Manager Chapin, and there is no doubt that the exchange of ideas and opinions will bear fruit.

Of the entertainment, the banquet on the night of the 17th, was the big feature. It was served in the largest room in the main factory, which had been cleared for the occasion. The decorations were in line with the "Country Circus" invitation that brought the agents to Lansing and carried some of them at least to their "boyhood days down on the farm." Hay and cornstalks hid the beams and the windows, while corn in the ear, hay, straw, pumpkins, squash and the like "set off" the big room, in one corner of which a stage had been set in a hay mow. "Jack o' lanterns" furnished the illumination, and during the dinner cackling chickens and a few bleating sheep made their appearance from nowhere in particular. A vaudeville troupe had been brought from Chicago to furnish divertisement. It was made up entirely of Nellies, Retas, Rosas and Claras. There was not a he on the programme. One of the troupe made her appearance on the stage in a redlighted Olds runabout and warbled parodies in which "Oldsmobile" figured largely. "In My Merry Oldsmobile," which rhymed with "fair Lucile," was her first number. "In the Shade of the Old Apple Tree," "My Irish Molly O," "Tammany" and "Goodbye, Little Girl, Goodbye," were each parodied for the occasion. There was a special menu card for each guest, each bearing a comic sketch to add interest. The banquet was a tremendous success. On Saturday the visitors and the factory staff, accompanied by a band, journied to Ann Arbor in a banner emblazoned special train of three cars; there they saw the crack University of Michigan football team wallop Wisconsin. They also saw collapse a grandstand containing several thousand spectators. This latter had not been arranged for their benefit.

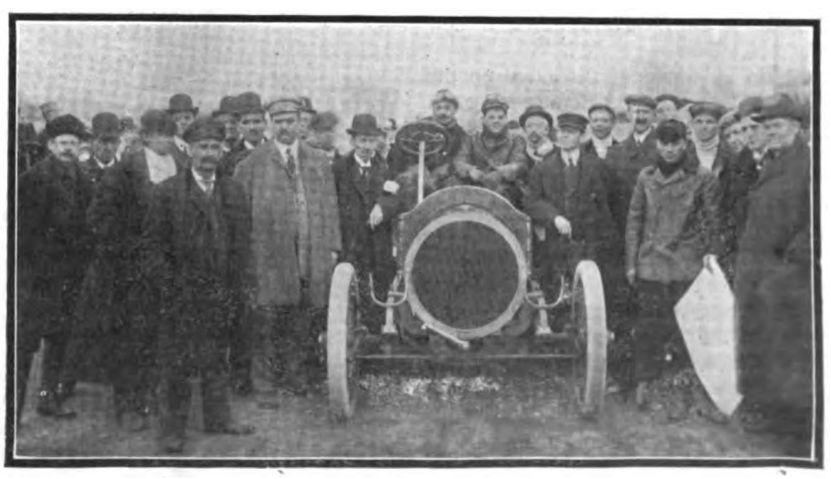
1000 Miles Inside of 24 hours, at Last, and by an American Car.



CLEMENS IN FULL CRY.

By circling the one-mile track at the fair grounds, Indianapolis, Ind., just 1,094 3-16 times between the hour of 2:45 p. m. Thursday, 16th inst., and the same time the following day, F. W. ("Jap") Clemens, assisted by C. C. Merz, succeeded in wiping from the slate all previous records for that time—twenty-four hours. To be exact, he beat the record made by Guy Vaughn in a foreign car on the Empire track, New York City, June 23, by 78 9-16 miles, and also reduced Vaughn's time for 1,000 miles 1 hour 35 minutes 19 1-5 seconds. Incidentally, he set up new figures from 650 to 1,000 miles. The significant feature of this performance that make "ducks and drakes" out of Vaughn's record is that Clemens drove an American car—a stripped stock National touring car. The event was formally sanctioned by the A. A. A.

Throughout the flight against time Clemens exhibited a measure of grit and pluck that stamps him as one of the most daring drivers in the country. The attempt began in the nature of a race. Two cars started, both 40 horsepower Nationals, Clemens at the wheel of one and Charles C. Merz, a seventeen-year old boy, on the other. They were the same cars and the same drivers that entered the 100-mile race on the same track on November 4, when Clemens set up new figures for the distance. On Thursday they were started one-half a minute apart, and ran very evenly until the first tire troubles of Merz's car caused him to lose several minutes. This happened before the fiftieth mile post. Clemens, after breaking all records from fifty miles, had one of his rear tires burst in the ninety-fourth mile, compelling a stop of 7 minutes 18 seconds. He was then 2 minutes 19 3-5 seconds inside his former record made in the 100 mile race of November 4.

Merz was about five miles behind Clemens at the 150th mile, when, on entering the stretch for the 151st mile, his car suddenly swerved and crashed into the fence. All the way up the stretch the judges and what few spectators there were could hear an unfamiliar bumpety-bump, but were unable to diagnose the cause or the reason for the sound; it was growing dark. All this time Clemens was endeavoring to keep his car right side up and regain the centre of the track, but after he had torn off enough pickets to build a summer house, plunged through. By the time the judges realized what was transpiring Clemens yelled, "All right!" When they reached the scene of the accident the plucky driver was still in the seat and holding fast to the steering wheel. The front wheels were smashed, the frame bent and the radiator ruined, but the driver received not a scratch.

Then the five-hundred Prest-O-Light lamps which had been strung around the track at intervals of twenty-five feet were turned on, and made an excellent substitute for daylight. It was then decided to put Clemens on Merz's car, as he had been reeling off miles in less time previously.

CLEMENS AND MERZ AFTER THE FINISH.

Digitized by Google

Throughout the night the drivers were alternated, each doing between fifty and one hundred miles before changing. As the flight against time continued the surface of the track down near the pole was worn away and the bed of sharp gravel exposed. Naturally this proved destructive to the tires, and much time was lost throughout the night by frequent changes.

The drive throughout the night was one that will never be forgotten by Merz and Clemens or the judges and few spectators who stayed till the finish. The weather was bitter cold from 11 p. m. until 5 a. m., and the plucky drivers suffered in consequence. Icy blasts from the north wind caught the drivers at every turn and up the stretch. At times they were so numbed by the weather that when one was relieved he would have be carried into the judges' stand. On several occasions Clemens and Merz had to be rolled on the floor before they could regain control of their stiffened muscles. The greatest pain the men suffered was from cold to their eyes. During the first afternoon they were able to wear goggles over their eyes, but as the night wore on and the cold became more intense it was impossible for them to wear this facial protection, because the frost would freeze on the lenses and make it impossible to see the track. This was the most pronounced hardship they encountered during the entire run. When the race ended a large crowd was at the track to cheer the two men, and they were given a most royal ovation. The strain, however, on them had been almost unendurable, and it was several hours before they assumed normal life. Their eyes were swollen almost shut and were so bloodshot that the white around the balls was hardly visible.

At 1 o'clock Friday morning Clemens had succeeded in passing the 475 mile post. He was then reeling miles off in 1:04 or thereabouts. At 650 miles Clemens had regained the time lost when he plunged through the fence, and was then nearly 18 minutes ahead of Vaughn's record. From then on he and Merz steadily clipped seconds off each succeeding fifty miles, and at 1,000 miles the watches gave the time as 21 hours 58 minutes 4-5 seconds, beating the previous time of 23:33:20 by 1 hour 35 minutes 19 1-5 seconds. They continued at the wheel until the end of 24 hours, when the scorers announced a total mileage of 1,094 3-16 miles, a new world's record.

Had not the misfortune of tearing up the fence happened to Clemens, it is more than likely that new figures from 150 to 650 miles would have been established. At the 100-mile post Clemens had shattered his own figures of 1:53:21 4-5, and at 150 miles was thirteen minutes ahead of Guy Vaughn's mark. Then the accident occurred, and the drivers set to work to overcome the lapse of time. One peculiar coincidence of the accident was that in this race Clemens went through the fence, and in the previous 100-mile race Merz was the one to take the Oldfieldian plunge.

The average speed maintained during the twenty-four hours, including stops, was 45 7-12 miles per hour. The total time lost during that period for tire repairs, refilling oil, gasolene and water tanks was 2 hours 54 minutes 12 seconds, making the actual running time 21 hours 5 minutes 48 seconds. This shows an average speed while actually running of 51 9-10 miles per hour, no mean performance for an ordinary stock car.

The following summary shows how Clemens and Merz erased Vaughn's old figures:

Miles.	Former record.	Clemens's time.	Beat record by
150	3:05:38	2:52:32⅘	0:13:05⅕
650	14:26:47	14:08:51⅘	0:17:55⅘
700	15:53:35	15:10:29⅗	0:43:05⅗
750	17:27:10	16:20:25⅕	1:06:44⅘
800	18:52:44	17:17:26⅕	1:35:17⅘
850	20:06:46	18:23:44⅗	1:43:01⅗
900	21:21:57	19:44:48⅕	1:37:08⅘
950	22:33:16	20:54:50⅗	1:38:25⅗
1,000	23:33:20	21:58:00⅘	1:35:19⅕

Distance in twenty-four hours, 1,094 3-16 miles, breaking former record by 78 9-16 miles.

Club to Fight Toll Roads.

The Cincinnati Automobile Club is preparing to make war on the toll roads of Hamilton, Clermont, Kenton and Campbell counties in Ohio, and will send a delegation to the coming session of the legislature to demand favorable legislation. The complaint, which is not a new one by any means, is that the toll roads charge automobilists exorbitant rates for using the thoroughfares. Several turnpikes in Hamilton County have not yet been purchased by the County Commissioners, and one of these, against which complaint is made, is the Harrison turnpike. Another is the Milford turnpike, where tollgates are encountered after leaving Madisonville and before reaching Milford. Several automobile owners have already had disputes with the tollgate keepers on the Harrison pike.

The automobile owners claim the law provides that toll shall be collected on vehicles drawn by a horse or other animal; that this law was made long before the automobile was dreamed of, and that the automobile, not being drawn by any sort of an animal, does not come within the scope of the law, and consequently no tolls can be legally collected on an automobile. The toll owners contend that the automobile is a vehicle, and not being particularly prescribed in the law, the toll people can make any schedule of rates for automobiles they please. The Alexandria pike owners, in Kentucky, announced that they did not want the automobile on their pike at all, because the pike is travelled extensively by women, whose horses got frightened at the automobiles.

They, therefore, charged an exorbitant price for the automobiles, and it formerly cost $5 in toll to go from Cincinnati to Alexandria and return. An over-the-river automobilist paid this price, took a receipt and sued the turnpike owners. He won in the courts and the price was reduced, so that now an automobile trip can be made to Alexandria and return for 85 cents. The scale of prices for automobiles was one cent for each horsepower a mile, or, in other words, a 20 horsepower automobile was assesed 20 cents a mile. The automobile owners assert that the Harrison pike people are almost as extortionate in their demands.

Rockford's Climb on the "French Plan."

Rockford's (Ill.) first hill climbing contest, promoted by local automobilists and held on Corey's Bluff, 10th inst., was a decided success despite that most of the participating machines were small stock cars. About two hundred spectators were attracted to the course, and those who were not fortunate enough to possess motor cars were compelled to walk over a mile to the bluff.

Havens, driving a 22 horsepower Buick, made the best time of the day, 0:25½, from a flying start, and a 16 horsepower Knox, driven by Cutler, made the next best percentage, although it did not climb the hill in the second fastest time. The committee figured out the awards by a French system, and after working three days finally made up the summary.

From a standing start Vernon Cole, in the "Scared Rabbit," whatever family that belongs to, made the best time, 0:45 1-5, but the judges figured its percentage at .417. The air cooled Knox, which made the ascent in 0:50 4-5, won with .353 per cent.

The scores of the competing cars in the climb follows:

FLYING START.

Car and driver.	Weight.	Time.	P. C.
Buick, 22 h. p., Havens	2,075	0:25½	.270
"Scared Rabbit," 12 h.p., Cole.	1,300	0:31	.2784
Franklin, 10 h. p., Hutchins..	1,200	0:33⅘	.281
Knox, 16 h. p., Cutler	2,300	0:40	.2780
Rambler, 18 h. p., Henry	2,200	0:41⅘	.434
Glide, 16 h. p., Dunn	—	1:05	—
Rambler, 8 h. p., Carpenter..	1,575	1:05⅘	.354
Premier, 16 h. p., Rogers....	2,200	1:10	.563

STANDING START.

"Scared Rabbit," 12 h.p., Cole.	1.300	0:45⅕	.417
Buick, 22 h. p., Havens	2,075	0:45⅘	.485

Knox, 16 h. p., Cutler	2,300	0:50⅘	.353

Bertrand Fails to Break Record.

Clovis Bertrand did not break the speed laws of as many States as he anticipated. He set out last Friday, 10th inst., to set up a record for the run from Chicago to New York, but was forced to abandon the attempt just before reaching Cleveland because of slippery roads. Bertrand reached Toledo, 276 miles from Chicago, at 1:05 o'clock that afternoon, having maintained a speed of thirty miles an hour up to that point. In the run from Toledo to Cleveland he encountered slippery roads, and realizing the futility of continuing, he left the car in a barn near Cleveland and disgustedly took a train back to the Windy City. The run, while it lasted, was made in a French car and under the "auspices" of the New York importer who handles it. The record still stands to the credit of an American car, the Columbia.

MYSTERIOUS LAW FRAMED

Morris Signalizes His Re-election by Hinting at it, also Suggests A. C. A. Branches.

Speaking through its newly re-elected president, Dave Hennen Morris, the Automobile Club of America has placed itself on record as being desirous of bringing about a change in the existing New York legislation, which it so strenuously battled to save from outside molestation last spring. For the present, however, the proposed law is a deep, dark, State secret. The news came out at the annual meeting of the club, which took place on Monday last, the 20th inst.

Only one ticket was presented. President Morris was re-elected, and the other officers chosen were: Vice-presidents, Colgate Hoyt, Frederick G. Bourne and General George Moore Smith; treasurer, W. S. Fanshawe; governors (to serve three years), Colonel John Jacob Astor, George F. Chamberlin and Schuyler Skaats Wheeler; governor (to serve two years), William Pierson Hamilton; governor (to serve one year), John E. Borne.

In explanation of his announcement that the club is now having drafted a new automobile law which it will endeavor to have passed at the approaching session of the legislature, Mr. Morris spoke of the attitude of the club last year when it resisted attempts to change the existing law by amendments, preferring to give that law an opportunity to demonstrate its fitness or the contrary.

"But circumstances have now led the committee to believe that a new law should be enacted," he explained further, "and a bill is being drafted which, it is believed, will be rational and fair to all. The bill is based upon a totally new theory from any automobile law now in existence, its purpose being to act as a more efficient control on the reckless driver and yet allow greater freedom to the prudent driver."

Among other suggestions contained in the annual report, one advising the establishment of branch club stations in various parts of the city, proved a great surprise to the members. The plan is entirely new and is advocated on the ground that the capacity of the new clubhouse in Fifty-fourth street, which is not expected to be ready for occupancy before next summer, is far short of the number of cars owned by resident members. The number of the latter has now reached 899, which led to the suggestion that the active membership limit be increased to one thousand. The creation of a new department of the club, to be known as the touring department, which should be in charge of a man conversant with routes, maps, hotels, customs regulations and similar information that is constantly inquired for by intending tourists, was also advocated and the fact made known that a new agreement with the German Automobile Club is under negotiation, the purpose of which is to give American automobilists touring and custom house benefits in Germany. In closing Mr. Morris called attention to the prevalence of bad smelling and smoky exhausts on cars in this city—a matter usually due to ignorance or carelessness, and which should be prevented as far as possible as is done in Continental cities, particularly Paris.

When seen at his office the next day by a Motor World representative in quest of more definite information regarding the law which the club will attempt to have passed, President Morris wished to be excused.

"At the present moment," he said, "I am not at liberty to say anything about it; otherwise I would have made my previous reference to it more definite. The bill has been drafted by a committee appointed by the club and before being made public it is to be submitted to other associations."

"What other clubs or associations besides the Automobile Club is interested in the measure?" was asked.

"That I can't tell you either."

"Well, then, to approach the subject from the other end, What are your objections to the law as it now stands?"

"In the first place," was the reply, "it converts into a crime an act which is not one of intention. If a man exceeds the law by driving a fraction of a mile over the legal limit, he is guilty of a crime. The law is based on a technicality. Then the punishment provided for is inadequate on the one hand and too severe on the other. What is a fine? Aside from the law itself, I think this entire system of hauling a man before a city magistrate or a justice of the peace is all wrong."

"But, is it not your opinion that the highway laws of the State are sufficient to cover all cases that may arise without the existence of a specific statute to cover the automobile?" was asked.

"No, it is not; I think a specific law is necessary."

"What are the chief features of the national law, the necessity of which you have also referred to?"

"I cannot give you that at the present time either. Of course, Congress has no power to legislate over any State roads except those on which the mails are carried—post roads. The bill we have in mind would not supersede any State legislation, but is intended rather as a guide for the states in legislating on the subject. Further than that I am not at liberty to give you any details of either of the bills, which I think will be made public in the course of a fortnight or so."

Sumter forms a Club.

Sixty-four automobilists of Sumter, S. C., have organized as the Sumter Motor Club. The officers elected were: President, Dr. J. A. Mood; vice-president, Dr. Walter Cheyne; secretary-treasurer, H. Harby.

FAILED TO "STUMP" THEM

Hill was a "Teaser" but All Reached the Top — Steamer Makes Fastest Ascent.

Good weather, large crowds, perfect arrangements and fast time combined to make the annual hill climbing contest of the Rhode Island Automobile Club, held at Pawtucket, last Saturday afternoon, 18th inst., a thorough success, and although the hill was an "axle breaker" no serious accidents occurred to mar the affair.

The climb was held on Stump Hill, just out of Pawtucket. Starting from Smithfield avenue, for about six hundred feet, the road has a grade of about 2.54 feet per hundred, with a sharp turn at the summit. This slight incline did not prevent a good start and enabled the contesting cars to get away in good fashion before striking the heavy grade of 11.47 feet, which runs along for six hundred feet more. At the top of this sharp rise the ascent diminishes slightly, going up to the reservoir on a grade of seven feet per hundred. At the top is another sharp turn on the level, where the road turns off for the descent. The distance from the start was exactly one-half a mile and five "thank-ye-ma'ms," and the sharp curve, too, at the summit, added to the hazardous nature of taking the incline on the high.

There were thirteen cars entered, all belonging to club members, and the hoodoo which is supposed to go with thirteen "went" in this case. Just before the races started John I. Snow, who had entered a Peerless touring car, was trying it out on the hill. He struck one of the depressions on the road and the rear axle cracked. Earlier in the day Herman Waterhouse, in a Pope-Toledo, broke a crank shaft in the same manner.

The first car to essay the climb was a Stanley steamer, driven by F. N. Baldwin. He was the winner of this class and also in the free-for-all, winning the Knight trophy, his time being 55 3-5 seconds. B. F. Blackinton, also in a Stanley, made the ascent in 0:65 3-5.

There were three starters in the second class, for stock gasolene runabouts, and George Chapin, in a Knox, went up in 1:43. E. Dauer, in a 10 horsepower Franklin, finished ten seconds behind the winner. Two 20 horsepower Stevens-Duryea cars fought for honors in the class for cars costing less than $2,800. The one driven by Robert Winsor took the hill in 1:20 2-5, while C. D. Snow's followed in 1:25.

The heavy cars appeared in the last event, for touring cars costing more than $2,800. A. C. Lee, driving a 30 horsepower Pope-Toledo, covered the distance in 1:08 4-5, and another car of the same make and power, with J. K. Crawford, did it in just one second more. This caused the first real thrill of excitement, and in fact the only one of the af-

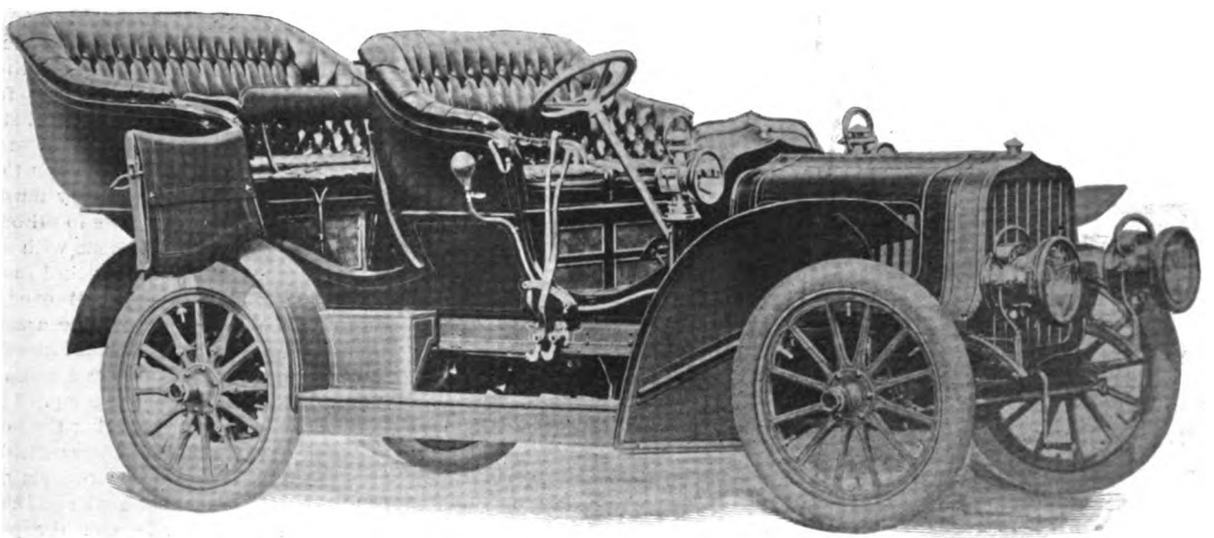
Denver Wants Lamps and Lots of 'Em.

Lamps to the front of them, lamps to the right of them, lamps to the left of them, lamps to the rear of them, red lamps, white lamps and all kinds of lamps—this is the lampoon that has been launched against the owners of automobiles in the city and county of Denver, Col., by Supervisor Webb.

His bill provides that every person owning an automobile must carry an identification card, a license number, a horn, the lamps and—a few other things. There must be two lamps in front of the machine, lamps on the side, one or more red danger lamps in the rear and a white lamp placed over the number of the machine in the rear, that will throw a strong light on the aforesaid number and enable constables to distinguish numbers at night.

Quite naturally, the Automobile Club of Colorado intends to fight against the passage of the measure. The one redeeming feature of the measure is that clause which makes it a misdemeanor punishable by a fine of from $1 to $100, for any person caught puncturing the tires of any other person's car or in any way meddling with a car that does not belong to him. This clause is aimed at small boys, who have a habit of tinkering with machines when left standing on the street.



Battle Heads Seattle Club.

At the annual meeting of the Automobile Club of Seattle, Wash., the following officers were elected: President, Alfred Battle; vice-president, Alfred Latimer; secretary-treasurer, F. R. Seymour; directors, the officers, A. S. Kerry and Walter S. Foster. A new committee, to look after the city streets, was created. The most important announcement was that the club had procured one thousand signboards to be erected throughout the State.

Points of the New Pope-Toledo.

In the 1906 Pope-Toledo, which is nearly ready for the market, several novel features have been introduced, all of which make for greater excellence in the car without destroying the distinctiveness which has characterized the product in the past. Thus, an improved grade of steel has been produced, which, in conjunction with a more liberal use of aluminum in parts which are not subject to excessive strains, makes it possible to reduce the total weight of the machine without sacrificing anything in resisting power against shocks and undue loads. By this means, the remarkable ratio of one horse power for every fifty-four pounds weight in the car has been secured, while in the motor the ratio of weight to power is 1 to 8.8. The machine thus is distinguishable as the lightest for its power ever built for touring purposes.

The steel which is used in the construction of the engine and transmission parts, and in the axles as well, is the nickel chrome metal which combines with great strength the essential of elasticity such as is not commonly found in the harder metals. That which is used in the mechanical parts has an ultimate tensile strength of 225,000 pounds per square inch, while that used in the axles, requiring slightly different qualifications, gives an ultimate test of 110,000 pounds on the standard section.

In the motor a novel feature, and one entirely new in motor car design, will be the use of twin cylinder head construction. The cylinder heads will be cast separately from the cylinders, as heretofore, but instead of each being made a separate casting, the heads will be paired off, a bridge thus being formed between each pair of cylinders, which will serve as a brace to prevent distortion. The construction of the independent copper water jackets will be substantially the same as in previous models, except that the triple beading in the jacket which has up to this time been provided to allow for expansion will be done away with, the exterior of the jacket being perfectly smooth. Automatic inlet valves will be used as formerly, but the position of the exhaust valves will be altered so that tappet rod and walking beam mechanism will be used to actuate them instead of direct cam lifts. Although the jump spark ignition will still be retained, a special gear will be placed on the crank shaft which may be used to drive a magneto, at the option of the purchaser, a suitable bracket being arranged on the engine base to provide a support for this auxilliary. All the engine gears will be enclosed.

In the method of supplying the fuel a change will be made, the exhaust check valve being eliminated, and instead a hand operated force pump being used to lift the fuel from the main tank at the rear of the chassis to a 4½-gallon supplementary tank mounted on the dash, from which the feed to the carburetter will be maintained by gravity.

The general construction of the frame will be retained in its present form, a slight alteration being made in the forward section, in which the reverse curve at present used to narrow down that part which supports the engine will be replaced by a straight taper. The brakes will all be located on the rear wheels, a double set of drums being used, one for the running brakes, and the other for emergency application. Both sets will be double acting and of the internal expanding ring type.

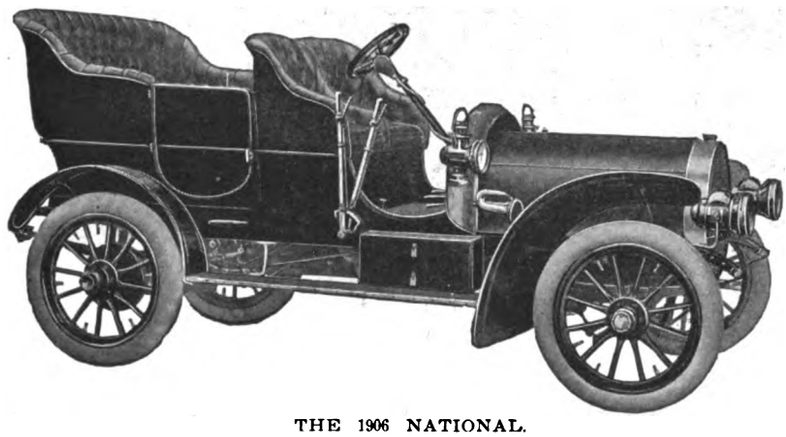
The mechanism of control will be unchanged except that a larger steering wheel will be used than in this year's models. A larger tonneau will be provided in the standard type of body, giving ample room for the use of an emergency "jump" seat for two persons, which when not in use folds away at the front of the rear footboard, leaving that space unhampered in any way. The body work will largely be of Circassian walnut, while the fenders, dash trimmings, hub caps and hood will be of aluminum.

The present desideratum of flexible control has been amply looked after, as is shown by the fact that the test car recently made a run over a measured course at the rate of 5¼ miles an hour, and later another of the same distance at the rate of 68 miles an hour, all on the high gear, while the machine carried a load of six passengers.

Here's the Pneumatic Cap.

Probably the most bizarre accessory placed on the market for the automobile driver consists of a "pneumatic cap," a title sufficiently suggestive of the purpose to which it it to be put. The crown is fitted with several hollow rubber balls adapted to be inflated, and is finished with a rubber band to grip the head. If the chauffeur will consent to wear one of these caps and will obligingly see to it that when he is forcibly hurled from the car that he lights squarely on his cranium, the makers will guarantee that instead of the usual unpleasant thud, he will rebound and gracefully alight on his feet—in other words, he will be charmed with the result.

Features of Olds's Two-Cycle Car.



The two-cylinder, two-cycle Oldsmobile, the announcement of which proved so surprising, will be rated at 20 horsepower. The engine dimensions are 5x5 inches; the cranks are set at 180 degrees and counterweighted. Bevel gear drive is employed. The wheel base is 102 inches.

Digitized by Google

Features of the New National.

In the new National car, which lately has been "doing things" in impressive fashion, the more salient features which serve to distinguish it from former cars of the "round radiator" brand are an increase in horse power, a longer wheel base and the adoption of the Hess-Bright type of ball bearing throughout.

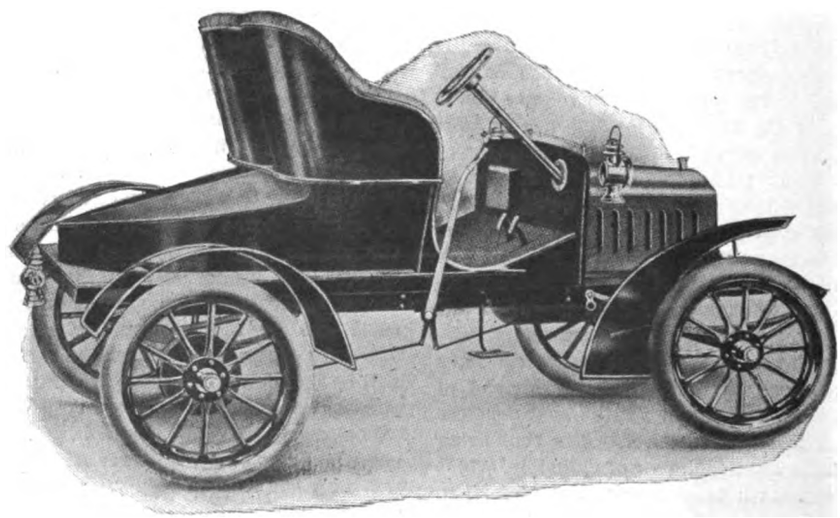
The cylinder dimensions of the new type are 4½ by 5 inches, an increase of a quarter of an inch in the bore over the last year's

THE 1906 NATIONAL.

model, which allows for an increase in the rated power from 25-30 to 35-40, though the new motor actually delivers from 42 to 44 horse power on the testing block. This gives a weight ratio of something like one horse power to ten pounds of motor weight, which is well up in the range of good practice.

Pressed steel frame construction is again used, with a sub-frame for the mounting of the power plant, the latter arrangement allowing for a better alignment of the motor with the rear axle than otherwise would be possible. The wheel base is now 104 inches, as against 96 in the last type of car, the standard tread being retained. The control, including the feature of duplicate drag links in the steering gear, is essentially the same as in last year's machine.

An all aluminum body is used, carrying five passengers. In general, the machine is notable for its compact arrangement of parts and the uniformly rational design which is manifest in every detail. This is seen at once in the housing of all moving parts as a protection against dirt and exterior shock; in the triple ignition system, ignition being obtainable from either primary cells, accumulators or dynamo; and in the location of the oil reservoir at the top of the motor, where it is subjected to a gentle heat at all times, thus preventing the oil from congealing and effecting a considerably economy in space.



It is announced also that in addition to the regular stock model here outlined, the National people will soon present a six cylinder machine, running on 121-inch wheel base and capable of carrying seven passengers. This car, which will appear at show time, will be nothing more nor less than a "big brother" of the present types, embodying all the new features of the regular 1906 machine, with may be a few others in addition.

Converting the Old Car.

The mechanical work necessary to convert one of the old style rear entrance cars into an up to date side entrance model by lengthening the frame has already been dwelt upon. This change will modernize the car's appearance, but will not help it in any other way, so that it is as well to take the "up to date" recommendation with some reservation—in fact, unless the car already has ample power and is in good condition it would not be a paying investment to put it through the transition process. There are many such cars, but there are likewise hundreds of cars the only out of date features of which are their rear entrance and short wheel base. Many of them are now coming into the repair man's hands for conversion, and in view of this the Carriage Monthly outlines the work necessary for completing the job—that is, rendering it ornamental after the new construction is in place. It is something that can be accomplished at slight expense.

"In a car recently modified in this manner," it says, "the tufting and pleating was in diamonds, the trimming on the back door was made up the same as the backs, which ran around the sides to within twelve inches of the front. In this space a large pocket with a flap was placed. In altering this car it was necessary to loosen the trimming. It was removed from the back door, the back was knocked loose on the door post on each side and around the top sufficiently to give the woodworker a chance to put in bolts. It was also loosed on the sides to prived for the width of the new doors. Taking the pockets from the sides was found necessary, and this was done carefully so that they could be used again. When ready for trimming the back door piece is replaced, strips of wood being placed across the bottom and up the sides of the door posts. Upon these the door pieces are tacked, and they must be brought out flush with the backs to fill out the hollow of the door, which is done with moss.

"Next the backs are tacked fast to the door post, bringing them well over toward the door pieces. There will be a space of about half an inch from the seat almost to the top. In this space tack a piece of flat lace of the same material as on the top. The pleats can be spread a little, making the door piece and back look like one. After tacking this fast the back is bound, the pockets are placed on the side doors and the doors should be blocked to the shape of the pocket. After the blocks are set in the doors for the pockets the doors are covered with wadding for padding. Then the material is tacked around the edge of the doors and finished with a cord and lace. The pocket is blind tacked on the bottom. Gimp is tacked on the side and the flap is tacked under the lace on top of the door. This pocket has a buckle which takes a strap on the flap, and, being of good size, it looks well. The back and doors are now done. It is necessary to make a small cushion to fit well between the two old ones. It is given a spring frame of the right size and must be made to match the old one, a snug fit being necessary. A binding is made and tacked on around the edge of the seat, and a box is made under it by running a board across underneath about one inch back from the edge. This panel or front of the box and its lid are covered with the same material and the same lining. Where the old trimming can be employed, the alterations will not involve any great expense, as the only new material needed is that for the small cushion and the lining of the door. Nor is any great amount of time consumed in making the change."

CONCERNING THE CHAUFFEURS

How they may be Classified—One Man's Definition of the Desirable Sort.

Somewhat akin to the servant girl problem appears to be the situation at present extant in automobiling circles, so far as it refers to the chauffeur. A comparatively few really competent men, a number who are not totally incompetent by any means, but who are far from ranking in the first class, and a mass of incompetent, inexperienced and generally ignorant individuals, would appear to sum up the personnel of the large body of men who are at present attempting to gain a livelihood through serving as drivers of automobiles.

The first named are naturally seldom in search of work; they hold the same position year in and year out, and are considered a valuable acquisition by their employers. There is an ever shifting movement of the second class, brought about by their incompetence, coupled with a desire for higher compensation, regardless of ability—a condition of affairs that is made possible by the fact that the number of men possessed of this moderate measure of skill is so far below the demand that exists for chauffeurs.

As for the third class, which corresponds with the "just landed" immigrant, who despite her ignorance will accept nothing less than the highest current wages, they are practially legion—every man who has completed a six weeks' course by correspondence or who has been allowed to run a car at one time or another is a chauffeur.

"Any one who is disgusted with his old business or who wants to try something new has an idea that running an automobile is an easy and profitable job," is the manner in which an automobilist of long standing sums up the situation as regards the general mass of wofully incompetent individuals who are constantly shifting from one place to another to the ruination of many a good car, as well as its owner's temper and fund of patience. "But no good chauffeur need be in fear of his job for the next twenty years,' is the opinion of the same authority; "for the demand now cannot be supplied, and a balance will not be struck for a long time."

"The good, reliable cheauffeur is one who can drive any car, and drive it well; who has no accidents, who is quick to act in an emergency and who always has his car ready. That is requiring a great deal, and it would be difficult for me to mention ten or twelve men in New York City who can fill these qualifications. These may be called bright, exceptional cases, but there is no reason why there should not be hundreds of others like them. Common sense and a comparatively small amount of mechanical knowledge are all that is required to be a good chauffeur. Comparatively few things happen to a good car, and these things are repeated in all of the best makes. If a chauffeur understands what causes these troubles and knows instantly how to remedy them, he must have a pretty thorough knowledge of the complete mechanism and can be trusted to tackle some unusual difficulty when it breaks out."

It is a somewhat anomalous state of affairs on the surface, but if looked into reveals all the earmarks of situations that have at one time or another confronted every industry requiring skilled labor and that has made strides forward out of all proportion to the increase in the supply of help. It is something that cannot be remedied in a day, but will gradually correct itself through the influence of education and the gradual weeding out of the totally unfit. As prospects are at present, however, it would seem to be a matter of a number of years before conditions will be such that even the poorest chauffeur should go begging for work.

"Selling Promenade" of Second-Hands.

Having proved so successful last year, the Automobile Club of Toulon, France, will repeat its "selling plater" race of last year. All who are desirous of disposing of a car, regardless of its age, sex, color or previous condition of servitude, may enter it in this tournament for a nominal fee. There will be no classification. The event simply consists of a public exhibition of the competitors for the benefit of intending purchasers. The cars will then be put through a "promenade" of twenty-five miles. Naturally, no attempt at record breaking will be made, but the time of all competitors will be taken at various points, although the ability to survive the ordeal will probably constitute the best recommendation.

Binghamton Chauffeurs Organize.

To "promote social interest and to increase and to ameliorate the ideas pertaining to automobile work," the Binghamton (N. Y.) Chauffeurs' Club has been formed. Organization was effected last week by the election of the following officers: President, Charles Hancock; vice-president, Charles Leonard; treasurer, Ward Decker; secretary, Philip F. Barrows; committee on ways and means, F. E. Spawn, Claude Darling and Ray Perry.

Chicago Prepares to Build.

A new clubhouse for the Chicago Automobile Club, to cost between $750,000 and $1,000,000, has been decided upon by the directors of the organization. At the meeting a committee was appointed to select a site. A feature of the new clubhouse will be a number of bachelor apartments. The garage, which will be equipped to accommodate three hundred cars, will be situated in the rear.

Failed to Prove the Negligence.

William A. Figie, a Syracuse man who wanted a few hundred dollars at the expense of the Amos-Pierce Automobile Co., of that city, is a sadder but wiser man. Figie brought suit against the Amos-Pierce Co., claiming that a car of the defendant company, while being operated in a negligent manner, ran into his horse and wagon. Judge P. J. Ryan granted a non-suit.

TAME SPORT AT KANSAS CITY

Runaways the Rule, even Mrs. Roddy Unkindly leaving Mrs. Blakely Far Behind.

Runaways galore constituted the sole feature of the race meet held by the Kansas City (Mo.) Automobile Club at the Elm Ridge track, that city, Saturday afternoon, 11th inst., unless a race for ladies can be included in the category. Over thirty-five hundred had gathered at the mile track expecting to see some real sport, but in this they must have been sorely disappointed, for with the exception of one race, at three miles for light touring cars, in which the second car to cross the tape was only two seconds behind the winner, the meet had the semblance of an endless procession around the oval.

Four runabouts breasted the tape for the first event, at two miles, and Charles Levendoski's Cadillac had little opposition, finishing fully eight seconds in front of the Ford, driven by H. G. Blakeley. Not content with winning this event, Levendoski entered the three-mile event for cars costing under $1,750, and beat another Ford by the narrow margin of two seconds. This was the so-called real finish on the afternoon. Moriarity & Co.'s 20 horsepower Stevens-Duryea carried off the prizes in the next two events.

H. A. Fowler, driving a 28 horsepower Packard, won the five-mile free for all in 6:43. At first this event looked like a race until the Buick went wrong, when the Packard had little difficulty in blazing the way for the Stevens-Duryea. Mrs. John J. Roddy, in a 24 horsepower Winton, drew the pole in the ladies' race and swung into the lead at the start. She easily won from Mrs. H. G. Blakeley, in a Ford. The time was 3:43. Philip Otto finished first in the obstacle race, with Frank Dean second. Summaries:

Two miles, for stock runabouts—Charles Levendoski, 8 h. p. Cadillac, first; H. G. Blakeley, 8 h. p. Ford, second; Ed. Steurwald, 8 h. p. Oldsmobile, third. Times, 4:07, 4:15, 4:29.

Three miles, for cars costing less than $1,750—Charles Levendoski, 8 h. p. Cadillac, first; Emil Dorn, 8 h. p. Ford, second; W. G. Guombo, Stevens-Duryea, third. Times, 6:12 6:14.

Five miles, for cars costing less than $2,800—Moriaty & Co., 20 h. p. Stevens-Duryea, first; D. C. B. Co., 16 h. p. Rambler, second. Time by miles, 1:34, 2:57, 4:17, 5:40, 7:01.

Three miles, novelty—Moriarity & Co., 20 h. p. Stevens-Duryea, first; H. A. Fowler, 28 h. p. Packard, second; Charles Stephens, 22 h. p. Buick, third. Time by miles, 1:45, 3:45, 5:32.

Five miles, free-for-all—H. A. Fowler, 28 h. p. Packard, first; Moriarity & Co., 20 h. p. Stevens-Duryea, second; F. E. Grant, Thomas, third. Times by miles, 1:28, 2:47, 4:05, 5:22, 6:43.

Two miles, for ladies—Mrs. John J. Roddy (Winton), first; Mrs. H. G. Blakeley (Ford), second. Time by miles, 1:56, 3:43.

Obstacle race—Philip Otto, Packard, first; Frank Dean, Stevens-Duryea, second.

THE PROPER SIZES OF TIRES

Weight of Car not the Sole Consideration—Other Factors That Have a Bearing.

The matter of tire sizes and weights, which has proven such a bone of contention in this country, is evidently cropping up on "the other side." It has led one of the British tire manufacturers, David Moseley & Sons, of Manchester, to go rather interestingly into the subject, and to point out that weight is not the sole factor to be considered in determining the tire sizes. The volume of compressed fluid air within the tire, the nature and construction of the tire cover, the speed of the car, the heat generated within the tire, and the attachment of the tire to the rim are enumerated as having to do with the case.

They present the following table giving the approximate English inch measurement of the French sizes of tires, the approximate cubic inches of compressed fluid air which the tires contain, and the weight per wheel and weight per car which a tire of given size will support, based upon the work which size 810 mm. by 90 mm. will do. This latter, if properly constructed, will, according to the Messrs. Moseley, support a load per wheel of 450 pounds, or, if the load of the car is equally distributed over all four wheels, a car weighing 16 cwt. for from 3,000 to 6,000 miles at an average speed of 25 miles per hour:

Size of tire. mm. mm.	Approx. inches.	Approx. cub. vol. com. air. Cub. inches.	Load. per wheel. lbs.	Load. of car. cwts.
700×65	28×2½	240	210	7½
700×75	28×3	372	287	10¼
700×85	28×3¼	413	362	13
750×85	30×3¼	427	375	13½
760×90	30×3½	476	418	15
810×90	32×3½	513	450	16
870×90	34×3½	558	490	17½
910×90	36×3½	588	516	18½
815×105	32×4	606	531	19
875×105	34×4	650	570	20
820×120	33×5	768	674	24
920×120	27×5	903	792	28

In this table it is assumed that the weight of the car is evenly divided between all four wheels. Of course, this is usually not the case. To determine the way in which the load is distributed, weigh first the front and then the back part of car separately by running first one and then the other half on the platform scales. Add the two weights together, and they should correspond to the total weight of the car. The weight of one-half of the car divided by two is the weight per wheel for front or rear axle, as the case may be. It will be seen why cars heavier than 28 cwt., fitted with tires no larger than 120 mm. (5 inches) run up heavy tire bills for their owners.

Compressed air in motion generates heat. The faster the speed the greater the heat; the greater the heat, the greater the strain on the tire; the larger the tire, the less the increase of heat and strain. So it will be understood that the faster the speed the greater the load per wheel and tire. If there is not sufficient volume of compressed fluid air within a tire to absorb the whole of the shock or vibration, the surplus shock is received by the cover of the tire, which dashes it to the car and engine, causing damage to the tire and to car in a similar manner to the way in which a pool of water receives a solid body thrown into it. If the pool be small, the reception of the shock causes a violent dashing of water against the banks; if the pool be large enough the disturbance is imperceptible. As the compressed fluid air within a tire must be reached through the solid cover, it stands to reason, asserts the Mesrs. Moseley, in conclusion, that the cover should be as yielding, flexible and sensitive as is consistent with road wear and tear, to interfere as little as possible with quick communication of shock to the fluid cushion.

Old Transmission Idea in New Form.

An old idea has just cropped out in a new form in a transmission of foreign manufacture, in which the scheme of using a double bank of gears which are constantly in mesh is utilized. In this particular case, instead of using a series of independent clutches which are applied by means of a key riding within the driving shaft, as in the well known American type, a single toothed member not unlike the male member of an internal crab claw clutch is used, which is fast upon the driving shaft, the latter being shifted longitudinally for the purpose of locking the various gears. In addition to this, a special form of clutch is used upon the driving shaft, which is automatically released by the master key to give a direct drive upon the high, with no gears running.

Adding to the Braking Power.

Rather a novel provision for the use of the motor as a brake has been made in an engine which has just been brought out on the other side. In it the throttle is interconnected with an air valve which opens an inlet at the base of the mixing chamber whenever the former is closed, thereby admitting to the cylinder a charge of clean air, upon which the pistons act in compression and which serves to free the muffler of any partly burned gases, thereby doing away with the annoyance of muffler shots when the gas is again put into action, and at the same time effects a slight amount of economy while the throttle is closed.

German Tire Prices to be Raised.

Competition among the rubber goods manufacturers in Germany is said to be so keen that they have found it impossible to increase their selling prices during the last year or so in accordance with the advance in the cost of raw material. But a point has been reached where it is impossible to continue to sell tires at current prices. The larger manufacturers will endeavor to come to an understanding in order to prevent further losses.

Sand, not Sawdust, for Garages.

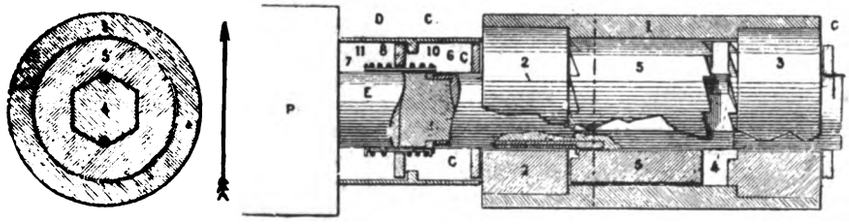
It is advisable always to keep the garage floor well sprinkled with sand to soak up any oil or gasolene which may be spilled, thereby saving the tires and lessening the danger of fire. There is a temptation to use sawdust for the purpose, but it should be resisted, as in many cases when soaked with oil sawdust will ignite spontaneously.

STARLEY'S ALL-STEEL WHEEL

British Innovation of Which Much is Expected—Tests to Which it has been Subjected.

It is generally conceded that the wire wheel when properly constructed is stronger, pound for pound, than one built of wood. This has, in fact, been made the subject of laboratory tests and established beyond a doubt. But even this is not a strong enough recommendation to give this form favor in the eyes of those who object to it mainly on the score of appearance, and second, because of the greater trouble in cleaning. Nevertheless, there is more or less interest manifested in the metal wheel, and, provided this be not open to the objections urged against the wire form, it would appear probable that metal will sooner or later supplant wood for this purpose. As things stand at present, the one form extant, the wire wheel, is scarcely seen except on racing cars, and even in that field but rarely.

The forerunner of what may prove to sooner or later become standard has appeared on the other side in the shape of an all steel wheel which is an exact replica of the wooden form now familiar. It is the invention of W. Starley, an Englishman, and is credited with a better appearance than the ordinary wooden wheel. The spokes are of bayonet section, weldless steel tubes, this practically representing the only departure embodied in its construction, as both the rim and hub are of standard make. Tests of the new wheel carried out in the laboratories of the Daimler Company are said to have shown it to be possessed of almost double the strength of the best wooden wheels of the same weight. Further than this, it was said to have shown remarkable elasticity—a quality tending to greatly increase the value of wheels built for automobile use. One of the tests consisted in subjecting it to a load until it showed a total deflection of seven-eighths of an inch, and upon the weight being removed the wheel resumed its shape without any set or deformation. The system employed in building it is claimed to insure absolute accuracy, so that every wheel is true and a perfect circle, and, what is more, defects in this respect brought about by the wheel being damaged are as readily corrected as in the case of the wire wheel, as each spoke is separately tensioned. Upon this feature the patent of the inventor is said to depend, and is accordingly not revealed.



The advantage of having an absolutely true wheel need hardly be dwelt upon, inasmuch as any inaccuracy in the wheel imposes a lateral strain upon the tire, and if the divergence from the perpendicular be serious the tire is dragged back and forth sidewise on the surface of the road, which means a great deal of wear, the amount naturally being in proportion to the extent of the defect. Further than this, there is a constant tendency under such circumstances to cast the tire. Being of metal throughout, further advantages are claimed for it in that it is not subject to that enemy of all wood wheels—"drying out"—and is not affected by climatic changes.

ELIMINATING DIFFERENTIAL

The Ingenious Fashion in which an English Inventor Accomplishes that End.

Elimination of the differential has long been an object sought after by designers, though the amount of success that has thus far attended their efforts has been small, if not altogether without result. It is necessary that both wheels should be driven whether the car is going straight ahead or rounding a curve, but it is equally necessary that their speed should vary under the latter circumstances. The differential is a more or less delicate and always expensive piece of mechanism and likewise entails added complication in the form of a two-piece axle in the case of the shaft drive, so that the desire to do away with it, particularly on cars where every item of cost is reduced to its lowest terms, may readily be understood.

One of the most recent attempts to accomplish this appears to be embodied in what is known as the Warnaut transmission, an English invention, in which the rear axle is a single piece, in spite of the fact that the driving wheels revolve independently. The axle carries at its centre a bevel pinion solidly attached and meshing with a driving pinion on the end of the Cardan shaft and so far as this portion of it is concerned is absolutely simple, so that there should be small necessity to remove the enclosing case of this bevel gear to inspect it. At each outward extreme of the rear axle is a chamber held in place longitudinally on the axle by collars at each end, and free to revolve with the wheel.

This is a sleeve or hollow cylinder closed at each end by a circular section fitted on the axle and the inner faces of which are provided with ratchet teeth set in opposite directions. In the accompanying illustration the cylinder is represented by 1, and its supporting and closing end pipeces by 2 and 3. In the space between the latter is a part 5 on the squared portion of the axle 4; this segment is likewise provided with ratchet teeth on each end adapted to engage those of the end pieces already mentioned, and which it does according to the direction in which it happens to revolve. At the inner end of the squared portion of the axle 4 are two grooves, opposite each other, cut in the latter for the reception of the rods 6. The latter pass beneath the piece 2 and the inner collar C, and are held together by the cup 7, which can move longitudinally on the axle. On this cup 7 slides, a sleeve 8, carrying on its outer portion a wire, arranged to be turned by a screw, which is fast to a shoulder, and consequently does not move. At the right and left of the sleeve 8 and on the cup 7 are delical springs, 10 and 11, resting with one end on the ring 8, and with the other on the shoulder of 7.

When the car is being driven forward the operation of the various parts of the mechanism is as follows: The revolution of axle in the direction indicated by the arrow causes the part 5, the rod 6, the ring 7, and the sleeve 8 to come together. The sleeve 8 winds on a screw thread and compresses the spring 11; the latter strikes its corresponding shoulder and causes 7 and 5 to engage, which thus lock with 2, the inner end section of the containing case 1. This is the position indicated by the illustration. As this takes place on each end of the axle simultaneously the driving wheels then run together.

But owing to the disposition of the ratchet teeth the wheels must either turn at the same speed as the axle or exceed it. In other words, neither can go slower than the axle is turning. When rounding a curve the inner wheel will accordingly revolve with the axle, but the outer wheel will run freely as its speed will be greater than that of the inner wheel and of the axle. Accordingly only one wheel will be driven when rounding a curve with this mechanism and that the inner wheel.

When running in the opposite direction the reverse of the operation already described in detail takes place and the parts 5 and 3 interlock. A simple arrangement not included in the illustration acts as a brake. Some of the advantages claimed for the device are self-evident, principally those of doing away with the differential and the employment of a simple one-piece axle, although where that of permitting the wheel to be braked on the axle and of distributing the braking strain equally between them enters is not clear, although the following explanation is vouchsafed by the makers.

It is evident that each time one of the rear wheels moves in its plane a braking strain is produced and consequently each time one of the wheels encounters an obstacle it has the effect to momentarily diminish the speed of the wheel, while the other wheel is forced by the differential under the impulse of the motor to go at a higher speed which causes the same stop in its plane and consequently the vehicle receives a shock. The same action causes the lurching of cars going at a speed of fifty to sixty miles an hour, as can be observed during races. All impending actions of the transmission, application of brakes included, irregularly divided between the two wheels necessarily produce a braking strain and a shock for which reason it is absolutely necessary to avoid the direct application of the brake as much as possible. Even the application of the brakes on the differential does not completely avoid the braking strain. The differential allows the wheels to divide as co-workers, and according to their requirements, the stopping effect has to divide itself unequally between them, causing again the inevitable braking strain.

In case of a straight propulsion the motor always communicates to the two wheels an equal proportion of energy, that is to say, one wheel can never be driven quicker than the other and it cannot stop in its plane.

Looking for Leaks with a Match.

Some time has been taken in finding him, but after a short absence the man who looks for leaks in the gasolene tank with a lighted match has been located on the Pacific Coast. Portland, Ore., boasts him as one of her citizens. He happened to be both chauffeur and owner of the car, and is reported to "have gone very carefully over the seams of the gasolene tank with a match in order to find a leak." The fire department obligingly took a hand, and is credited with assisting the fire in making a very complete job of it, as the fire fighters took pains to accomplish whatever the blaze left undone.

Hard Pressed for Names.

Builders of new types of automobiles are about as hard put to it for names as builders of ships used to be in the old days. If anything, they are worse off, in that they seem feel constrained to introduce somewhere in each the name of the motive power. Thus the latest, the "Petromobile," makes its bow in England.

Indians Turning an Honest Dollar.

According to advices, certain enterprising Indians of the Rosebud reservation, Sioux City, Iowa,, affected by the progressive commercial spirit of their white brethren, have bought some touring automobiles, which they will operate through the reservation, on a regular schedule and tariff.

To Build Garage on Mountain.

T. Phillips White proposes to build a large garage and hotel on the summit of the Orange Mountains, in New Jersey, and has obtained an option on a tract of sixty-five acres, where he intends to build. Being in the midst of a popular touring section, he expects considerable patronage from visiting automobilists.

FAVORS VANADIUM STEELS

Where They Could Be Used in Motor Car Work and the Objects to be Served.

By far the most interesting feature of the development of the motor car is the manner in which it has wrought out new methods and processes in the adoption of the various materials of construction known to the arts, and even has gone so far as to introduce others, for which, up to the present, there had been but slight use, and that to a limited degree. Thus, the manipulation of aluminum, both in casting for structural purposes, in casings and frames, and in the alloys which are used for bearing metals, has been brought to the front largely through the medium of the automobile. But far and away beyond the development of aluminum the effect which the design and construction of the automobile has had upon the development of grades of steel which are tougher and stronger than those demanded by the older arts is of tremendous significance.

The grades of steel which are best suited for the purposes of the motor car builder must, first of all, satisfy the conditions which are found in the best grades of the metal known at the present time, in point of toughness and strength, yet they must go further in endurance under repeated flexture and heavy shock and yield such results as are commonly attributed to the grades of mild steel which are known to common practice. Thus, the use of high carbon and nickel steels is growing constantly, and as well certain newer alloys are coming to be known, such as the chromium, tungsten and manganese compounds, and, latterly, combinations in which the somewhat rare and comparatively unknown element vanadium plays a most important part.

Vanadium steel, though it has been known to the metallurgist for a number of years, has yet to be put to popular test through a general introduction in motor car work. Yet, to judge from the result of tests which have been conducted in England and on the Continent with reference to the demands of this class of work, it is especially well fitted for use in parts which are liable to be called upon to withstand sudden and unforeseen strains. It has already found a considerable use in the chromium compounds as employed in armor plate and projectile work, and also to a limited extent in the construction of such parts as the crank shafts and connecting rods of gas engines.

Vanadium, the element, though widely distributed throughout the globe in the form of oxides which occur in iron ores and also in vanadinate, a mineral containing some 40 per cent of lead, 12 per cent of vanadic oxide and also portions of silica, iron and a lesser amount of silver, is comparatively rare in its pure state. It chief deposits occur in Arizona, South America, Spain and other parts of Europe; also, it is to be found in the ash of certain coals, where in some instances it reaches as high a proportion as 25 per cent, and also in blast furnace slags. The first instance which is known of its being prepared in its pure state was when Sir Henry Roscoe produced a specimen some twenty years ago. At that time it was worth many times its weight in gold. In appearance it is a silvery white metal, of low specific gravity and high melting point. Its preparation is extremely difficult, and can be undertaken only in the electric furnace. Until the introduction of the oxides in steel work the principal uses of the vanadium compounds were in the production of a pigment for textile work and ink making, for which purpose the slags of the Creusot works in France have been reduced for a number of years, the product of the industry in 1900 being said to have reached the amount of ninety tons.

In steel work, until recently, comparatively speaking, the small amounts of vanadium which have occurred in the metal have been lost to a great extent in the reducing process and have been allowed to go to waste. Among the earlier experimenters in the alloying of vanadium directly with iron in the production of highly ductile steels is a French engineer, M. Helouis, who inferred from the great ductility of Swedish iron and the fact that the Staffordshire pigs often contained a great deal of vanadium, while the irons made from the Staffordshire pigs had high ductility, that the effect must be in some measure due to the presence of vanadium in the metal, and accordingly sought to effect a definite combination with the object of toughening the steel. He found that the combination increased the tensile strength of the steel, at the same time reducing its elongation. Also, he learned that steel in which 1 per cent of vanadium was present was extremely soft, though capable of attaining great hardness upon chilling.

Other tests carried out at the Firminy Steel Works, which have become famous for the experimental work on chrome steels carried out there, showed negative results at first, but later developed results which confirmed the work of Helouis and gave remarkable strength to his theory. In fact, one specimen showed a tensile strength of 55 tons, with an elastic limit of 48 tons and an elongation of 10 per cent, before treatment, which upon the addition of the vanadium yielded a test of 74 tons, ultimate, and an elastic limit of 70 tons, while the elongation was increased to 11.3 per cent. The contraction of the vanadium sample was but 47 per cent, as against 54 before treatment. Moreover, it was found that quenching had a far greater hardening effect upon the vanadium steels than it did upon the ordinary carbon combinations.

Professor Arnold, of Sheffield, published the result of certain tests along the same line in 1900, in which similar results were shown, though in less remarkable contrast. A test of a vanadium tool steel was made, in which the latter surpassed a tungsten tool in the proportion of 75 per cent, the tools used being made with 3 per cent vanadium and tungsten, respectively, and tested on a cut in chilled white iron during a ten-minute run. The vanadium tool was found to retain its hardness at a visible red heat. As a result of these and other experiments conducted by Professor Arnold in 1902, the New Vanadium Alloys Co. was formed, and processes were established which are now carried on at the works of the Messrs. Willans and Robinson, of Queens Ferry, Flintshire.

The effect of a combination of chromium and vanadium in a steel which is designed to resist torsional strains is certainly beyond comparison. Thus, a sample containing 1.06 per cent of chromium and 0.169 per cent of vanadium, yielding an ultimate test of 52.6 tons and a calculated shearing stress of 40.3 tons, gave a torsional test of 1,628 degrees, corresponding to 4.52 complete turns before breaking, and another of similar composition gave a test of 4.96 twists before rupture. Still another sample of practically the same composition was turned through 360 degrees and then bent double without breaking or showing flaw.

In a paper read before the members of the Automobile and Cycle Engineers' Institute of England recently, of which the foregoing is in part a rescript, Mr. Alexander E. Tucker made the following statement as to the particular fitness of this compound for steels to be used in motor car construction:

"It would appear that this steel is particularly applicable for crank shafts, connecting rods, etc., of internal combustion engines and, indeed, any constructional work requiring great resistance to shock. I am aware that great trouble and loss have been occasioned by the repeated breakages of the large crank shafts of gas engines working on blast furnace gas and producer gas, and developing some 500 horsepower, and when the intensity of the explosion in these large cylinders is considered, it will be seen that very special requirements are necessary in the metal to meet it. Considerable elasticity is essential in such constructions, and fracture occurs because it is deficient in them. Hence, a metal with a high tensile and a high elongation figure would absorb these shocks very much better than any ordinary mild steel. These vanadium steels show very high figures on the impact tests, and so the sectional areas of such large shafts, etc., and similarly those of the smaller shafts, connecting rods, etc., for motor work would with much advantage be reduced.

"The practical significance of such results are, of course, now being recognized, and many hundreds of single and multiple throw cranks are in use. They have, however, in accordance with the wishes of the motor car builders, been slotted out of the forged bloom in the slab shape, but I am supported by very competent authority in my suggestion that they, with such a metal as we are now discussing, would be better bent from the round, as the flow of fibre would lend itself to resistance to the strains required in the same way that a natural knee for wooden ship construction is always stronger than one built up. With such steel no danger accrues by such simple bending, while the cost would be greatly less. I am informed that to make a six-throw crank weighing, say, 60 pounds finished, something like a 3 cwt. slab of vana-

Digitized by Google

dium steel is operated on, the metal removed being, of course, only scrap. The other uses of these steels are for tubular axles, gear wheels, springs, etc., all of which have given excellent results."

Some idea of the effect upon steels of various sorts to be obtained from the use of vanadium in varying proportions may be obtained from the following table:

Crucible steels—	Elastic limit.	Ultimate tensile strength.	Elongation in 2 inches.	Reduction in area.
Plain carbon manganese.	16.0	27.0	35.0	60.0
+0.5 per cent chromium.	22.9	34.0	33.0	60.6
+1.0 per cent chromium.	25.0	38.2	30.0	57.3
+0.10 per cent vanadium.	28.5	34.3	31.0	60.0
+0.15 per cent vanadium.	30.4	36.5	26.0	59.0
+0.25 per cent vanadium.	34.1	39.3	24.0	5.90
+1.00 per cent chromium +0.15 per cent vanadium	36.2	48.6	24.0	56.6
+1.00 per cent chromium +0.25 per cent vanadium	49.4	60.4	18.5	46.3
Open hearth steel— carbon manganese	17.7	32.2	34.0	52.6
+1.00 per cent chromium +0.15 per cent vanadium	34.42	52.6	25.0	55.5

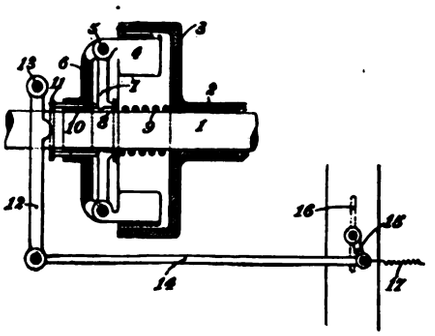
Urges an Automatic Whistle.

A suggestion which should warm the heart of a certain much-neglected former governor whose automatic speed checking brake was never legally adopted by his state, is that of an Englishman, who wants to have all cars equipped with an automatic whistle which shall blow whenever the legal speed limit is exceeded, and continue to blow so long as the rate is maintained. According to the scheme the whistle would remain silent so long as the machine was running at moderate speed, but would begin to wail and wail more and more so as the rate was increased until an unearthly shriek compelled even the most hardened chauffeur to slow down.

Facilitates Priming of Carburetter.

One of the features of the new Napier models for the coming year, upon which much stress is being laid by the English automobile press, consists of a convenience in the shape of an extension rod that permits of the carburetter being primed without the necessity of lifting the bonnet. It is in the shape of a tappet, or rocker arm, the end of which acts on the priming rod of the float chamber. This is connected with a rod extending below the level of the frame and readily accessible.

One More Leather Tire.



David R. and Oliver Salisbury, from some place out in Michigan, have invented a leather pneumatic tire, from which they confidently expect to reap a fortune. Naturally a stock company will be launched. J. L. Carleton and F. M. Delano, two Detroit financiers, are interested in the venture.

Ten thousand dollars' worth of stock has been placed on the market by the Smith Automobile Co., of Topeka, Kan. If disposed of, the company purposes to increase its plant.

RENAULTS' SPEED REGULATOR

Innovation Adopted by Famous French Makers —How it Controls the Pace.

Compulsory limitation of the speed at which a car may travel by means of a mechanical device which would prevent a certain rate being exceeded is an idea that has occurred from time to time to some bright legislators in this country, and they have suggested that a law be enacted in their bailiwicks making something of the kind necessary on all cars licensed to run on the roads of the particular jurisdiction in question. The idea is one that has apparently never been taken seriously by

any one but the promulgator of the law, and whether that particular individual ever worried much over the question of just how the carrying out of his pet creation was to be realized in the event of its actually finding a place on the statute books is extremely doubtful.

However that may be, Renault Freres have embodied this idea in the form of an automatic speed regulator, which will henceforth be made a feature of their cars and which naturally is of more than passing notice, although not possessed of any mechanical features greatly out of the ordinary.

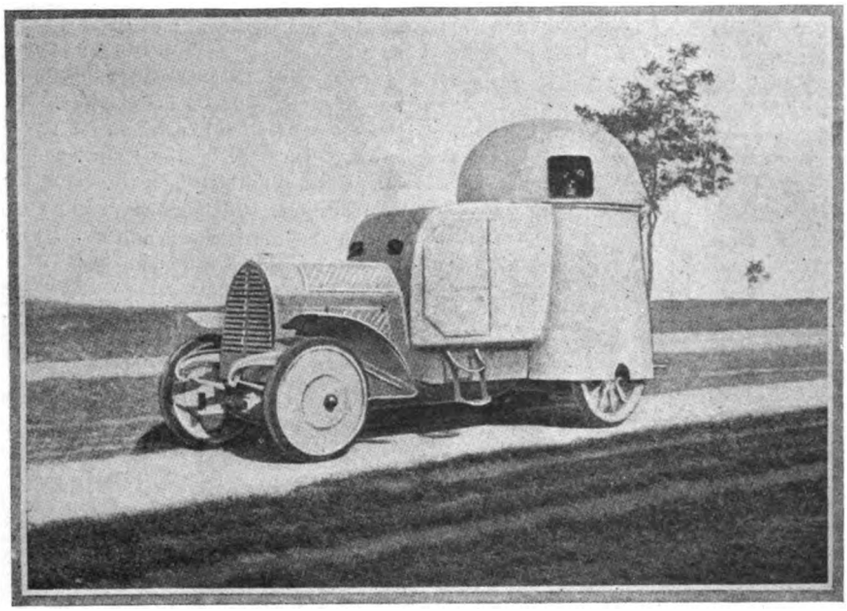
As shown by the accompanying sketch, the arrangement is mounted on a shaft, 1, which is directly connected with the wheels. This shaft may be the axle of the chains or the shaft commanding the wheels by means of a gear. It is placed behind the speed changing apparatus, and its speed is therefore in direct connection and works together with the wheels. One of the cushions, 2, of the shaft, 1, carries at its extreme end a fixed cylinder cover, 3. The blocks, 4, fix themselves to the pivots, 5, which are held by the arm of a plate, 6, which is fixed on the shaft, 1, and moves inside the cover, 3. Each one of the blocks, 4, is solid, with an arm, 7. The extreme ends of these arms rest with one part on a shoulder, 8, which can grip along the shaft and can be pushed back by a spring, 9. This spring and the shoulder move the arms, 7, to bring the blocks, 4, together with the axle of the shaft. The arms rest on the other side against the extreme end of the rods, 10, gripping the wheels and carrying the plate, 6, which rests with the other ends against the shoulder, 11, on the axle, 1. Against this shoulder, 11, rests an arm. 12, pivoted to fixed axle, 13, and moving on its loose other end a driving rod, 14, which commands by means of a crank, 15, the flap, 16. This flap has to regulate the gas admission of the motor. A small spring, 17, holds the arm, 12, at rest against the shoulder, 10.

When the car is in motion the blocks, 4, are on one side under the control of the spring, 9, and on the other side they are influenced by centrifugal force. As soon as the centrifugal force acts on the mechanism of the spring, 9, the blocks move toward the periphery of the cover, 3. Under the influence of the spring, 17, the arm, 12, is pushed back and the flap, 16, closes more or less. When, on the contrary, the speed of the automobile diminishes the action of the spring, 9, it will then bring this under the influence of the centrifugal force. The blocks, 4, move toward the axle, the arm, 12, is pushed toward the other side and the flap, 16, is fully opened.

What the London Shows Promise.

Among the novelties which are promised at the forthcoming British shows are an eight cylinder motor built for landaulette work, in which the cylinders are arranged in two groups of four each, placed on an incline and at right angles to one another, and designed to be run almost wholly on the high gear; a new type of six cylinder car (a Napier), and a novel type of landaulette, in which the driving sprockets have been placed within the side members of the frame, and are consequently quite out of sight. In both of these machines the motor is located under the driver's seat, the bonnet having been done away with, and the latter is, in addition, distinguished by the use of the Cee springs, such as were used on the coaches of our grandfathers years ago, the body being slung upon leather thoroughbraces.

The general tendency in motor design seems to be toward an arrangement of all the valves on one side of the cylinder, judging from the limited amount of advance information which is obtainable, the use of a single cam shaft which this permits being considered highly advantageous. One or two of the motors shown will have ball bearing crank shafts, following the initiative taken by the Hotchkiss people last year. In body design, the use of the side entrance is said to be firmly established, the fitting and upholstery work being more elaborate than ever. In general, the spring suspensions have been lengthened, and there seems to be also a tendency toward the use of wider rims and larger tires. Pressed steel frames are becoming more and more numerous, and the Cardan drive is gradually supplanting the side chain method.



A noteworthy point in regard to the Olympia Show is that of the three hundred exhibitors and more, of which over one hundred show cars, only fifty-one are foreigners, although several of the English houses will display foreign made cars. A distinctly novel feature of the business of the coming year will be in the giving of guarantees. Some firms will give guarantees for six months, others for one year, and still others will warrant their cars for two years

GERMANY'S PORTABLE FORT

Kaiser's New Rapid-Fire, Rapid-Running Fighting Machine, Embodies Some Ingenious Ideas.

Under the caption of "The Latest Armored War Automobile" the Allgemeine Automobil Zeitung publishes a description of the young gasolene-propelled steel fort shown in the accompapnying illustration. The value of the automobile for military purposes is a subject of unending interest and has attracted considerable attention ever since the car arrived at a stage that revealed it as a factor to be reckoned with, so that it is well to note what has led up to the building of this land cruiser by the Daimler Company.

As in the case of everything German that has to do with the war department, or for that matter, anything official, absolute secrecy is preserved as to the technical details of the car, such as weight, dimensions and the like, merely a general description being given. The body is divided into entirely separate compartments, one for the driver and the other in the shape of a turret for the manipulator of the rapid fire gun that is seen protruding from the port; the turret may, of course, be revolved at will by the occupant. As the driver's compartment is below the level of the firing shelter, the range of the gun is in no way obstructed and takes in the entire horizon. The armor consists of comparatively light, but extremely hard steel plate of sufficient thickness to render it proof against shell fragments and rifle balls, and possibly light artillery. This covers every portion of the mechanism, including an armored ventilator for the bonnet, armored casings for the hubs, axles, steering gear and other exposed parts, the body plating being extended down to within a short distance of the ground. The thickness of the latter has been calculated entirely with a view to affording protection to the mechanism of the car, that of the turret and driver's compartment being much lighter. Using armor of the same weight throughout would have rendered the machine too heavy to get over the ground at any speed. The driver is entirely enclosed in an armor plated conning tower provided with two openings, which permit of the range of vision extending over an arc of about 120 degrees, but he is further provided with an adjustable seat and when not in danger can elevate the latter so that his head protrudes through an opening in the top. This seat may be instantly raised or lowered without disturbing the steering arrangements, according as danger presents itself. This is accomplished by telescoping the steering post and all its auxiliaries so that as the driver changes his position he takes the entire control with him.

In full fighting trim the car is capable of a speed of fifty kilometers or about thirty miles an hour, and when without a sign of human agency visible, it dashes along the road at full speed, it is said to call forth visions of a ghostly apparition and leaves the impression of having witnessed the flight of some huge and terrible monster of unknown origin. As its value would be limited if confined to the road, it is provided with a sufficiently powerful motor and range of speed changes that make it capable of climbing anything up to a 60 per cent grade. Solid tires are used throughout and although not definitely stated it would appear that all four wheels are driven in order to increase traction, and while its stated ability to surmount grades would appear to be something phenomenal and far beyond anything hitherto attempted in this direction, the photographs accompanying the description and which show it cavorting around fields and climbing mounds in goat-like fashion, would appear to bear this out. This is claimed as its great advantage as it is capable of travelling in almost any country that is traversable by light horse artillery.

CARBURETTER EFFICIENCY

Why There is so Little Data Available—One Test that Easily is Possible.

Efficiency is one of the things that has not been sought after so much in carburetter design as effectiveness. It has come to be commonly accepted as a fact that fuel represents an item of least importance in the maintenance of a car, and whether this be exact or not, it is in general a matter of such relative insignificance as not to be considered worth while disputing. Accordingly it has not been thought particularly important to dwell very much on the subject of carburetter testing for efficiency.

The function of the apparatus, regardless of its design, is, of course, to deliver to the engine just the right mixture of gas and air, and in the proper quantity for each impulsive stroke. It should do this whether the engine be running fast or slow. Therein lies the difficulty that has harassed the designer all along, for the speed of the engine has a marked effect on the supply of fuel delivered to it owing to its being drawn through the carburetter by the suction set up by the vacuum in the cylinder. Naturally when varying speeds are to be considered the problem becomes more complicated, for owing to the length of the usual passage between the carburetter and the intake the suction of the engine at high speeds is controlled by an equalizing effect, as though a more constant flow were in force than in the case of the diminished suction at slow speeds.

One point that may be taken for granted when speaking from the point of efficiency is that the ideal carburetter will be one that will supply exactly the amount of fuel required per revolution at any engine speed. To determine this it is only possible to measure its consumption in terms of fuel used per revolution, per horsepower. This means that while the fuel is being consumed it is necessary to ascertain the number of revolutions of the engine, the horsepower developed and the amount of gasolene consumed, which quantity, divided by the number of cylinders and multiplied by two, will give the amount of fuel consumed per impulse stroke of any cylinder. To arrive at such a conclusion it is only necessary to employ simple apparatus, and, given the same engine in every case, the relative efficiency of different carburetters can readily be determined.

In testing one or more carburetters it is, of course, essential that the engine on which they are used should be the same in all cases, because engine efficiency—even though the engines be of the same design, size and construction—is a variable quantity. Given this as a starting point, it is necessary to ascertain its brake horsepower in the usual manner. By increasing or decreasing the load on the brake the engine may be made to run at different speeds as for the purpose of the test the car-

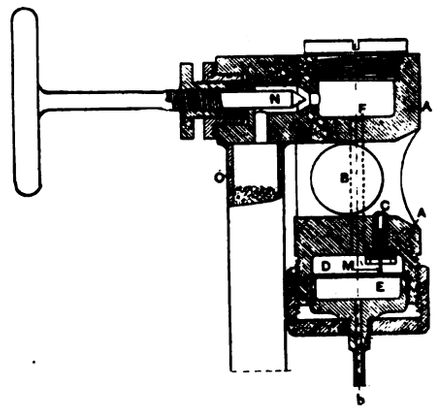
Digitized by Google

buretter must demonstrate that it will deliver the proper mixture at varying rates of revolution. For accurately recording this essential a speed counter and a watch are employed. Each power stroke means a certain quantity of fuel drawn from the carburetter, so that, given a constant speed, by determining the number of revolutions per minute it is easy to calculate the amount of fuel consumed per 100 or 1,000 r. p. m. By filling the float chamber until the liquid causes the float to rise and cut off the supply, and then attaching to the inlet a small piece of flexible rubber tubing connected with a vertical glass tube of about one-eighth inch bore, it will be possible by marking graduations on this improvised gauge glass to note exactly how much fuel the engine consumes per 100 or 1,000 revolutions at any load, as applied by the brake and registered in brake horsepower.

The position of the glass tube must, of course, correspond with that of the level of the liquid in the float chamber. While the graduations marked upon the tube bear no relation to any standards, they may be calibrated by ascertaining the cubic capacity of the float chamber, or they will, regardless of this, be of value as a basis of comparison by which to judge of the relative efficiency of different carburetters. Just what would constitute an "ideal" performance is not easy to say, for, as already stated, tests for efficiency have not been made the subject of long standing investigation, but are, on the contrary, something of recent origin, so that there are no precedents extant. But it goes without saying that the particular form of apparatus which demonstrated its capacity to run the engine on the minimum amount of fuel per horsepower and its ability to maintain a constant and uniform supply of mixture regardless of the engine speed, would be the most efficient and economical carburetter.

Foot Pounds vs. Horse Power.

More or less confusion is apt to arise in the mind of the lay reader over the apparently interchangeable use of the terms "horsepower" and "foot pounds" by some technical writers in referring to the performance of an engine. The difference between the two consists, in brief, in that between "work" and "power," since foot pounds expresses the amount of work that is performed and horsepower expresses the rate at which that work is being carried out.



Assuming as an illustration that an engine were to be employed for lifting a weight of 33,000 pounds vertically to a height of 100 feet; then the work to be done would be expressed as 3,300,000 foot pounds, regardless of the amount of time consumed by the engine in performing the task. If, however, only one minute were spent in accomplishing it, then the power would be expended at the rate of 3,300,000 foot pounds per minute, and the output of the engine would therefore be 100 horsepower. Reversing the example and assuming that 100 minutes were cousumed, the power would be exerted at the rate of 33,000 foot pounds per minute and the engine would be producing one horsepower.

INCANDESCENT MOTOR LIGHT

Features of the New Bleriot Lamp, Which is both Smokeless and Odorless.

Notwithstanding the hue and cry which is being raised, both in this country and abroad, over the use of powerful headlights within city limits, there is yet an abundant need of efficient illumination for the traveller over the country road. The use of acetylene for this purpose has come to be almost universal, but it is a recognized fact that were a really practical substitute for it to be produced, the carbide generator would quickly be thrown to the winds in favor of the later production.

Recently considerable stir has been occasioned over the invention by a French maker,

who also claims to have been the first to market a really practical gas lamp for acetylene, of a lamp using gasolene for fuel, and giving a light which in color and intensity fully rivals that obtained from the calcium compound. This is called the Bleriot light, after its inventor, and is nothing more nor less than an incandescent light, using a mantel or pastille of peculiar composition, and deriving its heat from the common fuel of the motor car, burned in an atmosphere of pure oxygen.

The principle of the burner may be seen from the accompanying scetional illustration which shows a cut taken through its centre. The chamber E contains oxygen, which is received under pressure from a supply tank through the pipe b, and serves to equalize its tension. From this chamber is led a small pipe m, of capillary bore, to the base of the burner. The gasolene supply is taken from the regulating valve N, after passing through the filter O, and after being heated in the chamber directly above the oxygen chamber, is fed to the burner through the annular jet C. The flame issuing from the jet impinges upon the lower side of the pastille B, which is composed of an oxide of rare earths and is heated to incandescence.

In starting the light it is necessary to heat the burner by means of a small pad of cotton soaked in alcohol, which is placed upon the top of the gasolene chamber. After the heat has become great enough to vaporize the gasolene within the oxygen is turned on, and after a few seconds the pastille becomes hot and begins to give forth a powerful white light. After this no further attention is required, and the lamp burns evenly and without smoke or smell.

As placed upon the market, these lights are installed in special lamps which are fitted with shutters, by means of which the light may be shaded when meeting traffic. The amount of gasolene carried in the lamp itself is very slight, and this, coupled with the fact that the oxygen, though fed under pressure, is present in but a small quantity at any one time, makes the affair practically safe in use.

Features of the New Panhard.

It is announced that Panhard & Levassor, once leaders in adopting new features, are this year coming into line with other builders, and will produce next season, among their other types, a six cylinder machine. In addition, the regular line will consist of a four cylinder 15 horsepower model and an improved type of 24 horsepower. Probably the most notable innovation in the smaller powered car will be the adoption of the so-called "demi-pincette" or three-quarter elliptical springs, which make possible a reduction in the total length of the body without losing any of the easy riding quality which comes from a long suspension.

Other features, including the armored wood frame, will be retained, the chassis and motor being largely replicas of the present types. The Krebs carburetter will still be used, with hydraulic regulation, as heretofore. For ignition, a new type of the Eisemann high tension magneto will be installed, a feature of the equipment being a provision for the use of dry batteries through the coil and distributer of the magneto in case of derangement to the regular system.

One Cause of Chipping.

The chipping and ring cracking of paint and varnish on running parts cause many a mechanic more or less vexation, because he does not see how to prevent it. Among the causes may be mentioned two, viz., the coats may dry too quickly or there may be more coats then necessary. A running part should never have more than one flat coat of japan color. Chipping and ring cracking is caused by using a color and varnish or a rubbing varnish that dries too quickly.

Here's the Armored Axle.

A decidedly novel form of axle construction has been introduced in one of the new models of foreign cars which has just been announced, in which the usual tubular axle is reinforced by means of an Ash core, creosoted and forced into place. It is the armored wood idea carried out to the last degree.

Keeping the Muffler Clean.

It pays to keep the outside of the muffler clean, not alone for the sake of appearance, but as well because it will retain a greater amount of heat when coated with mud than when clean, and hence will not serve its purpose as well.

THE 1906 MODEL B

Rainier

"THE PULLMAN OF AUTOMOBILES"

has arrived and is now on exhibition at our show rooms. You will do yourself an injustice if you decide on your car without investigating this triumphant American production. Equal to any car, built in any country, at any price. Make and break spark. Sims-Bosch Magneto. Bevel gear drive. Continental Tires. Aluminum bodies.

MODEL B RAINIER, 30-35 H. P. PRICE, $4,000.

Do you realize fully the great superiority of the "make and break" over the jump spark?

Do you know that it does away entirely with the coil, the commutator, the batteries, and the spark plugs, and substitutes for all these a simple hammer and anvil, mechanically operated, which cannot get out of order.

Do you know that 90 per cent. of the foreign makers have already adopted this method?

Do you know that the RAINIER car is guaranteed not to cost one dollar for repairs within one year of purchase, unless you have an accident, and that it stands alone in this respect?

Learn all about it in our new Bulletin just issued.

THE RAINIER COMPANY, Broadway, cor. 50th St., New York.

How Peter's Whistle Stirs Peoria.

"Peter Weast has a new air propelled automobile whistle and graveyard disturber," says the Peoria (Ill.) Transcript. "Pete put it on a couple of weeks ago and got it into full voice last week. It is a large whistle with a strong, durable throat and a full contralto voice under excellent control. When in a quiet mood it can be heard a mile. When Pete jabs his firm expansive foot down upon the lever, however, and pulls its larnyx wide open, people in Bartonville get out on the porches and look for a steamer which has wandered out of its course and is trying to make a landing at Bartonville asylum. The whistle is made out of an old second hand Gabriel's horn, and is blown by compressed tornadoes and other atmospheric disturbances produced by an air motor. This motor is able to take an ordinary chunk of Peoria air, which isn't able to produce anything worse than pneumonia by itself, and by mixing it with gasolene and throat gargle, squeezing it into one-tenth its original space and then letting it out, this brass bughouse filler is able to make a noise out of it that makes a horse walk out of the harness sideways and causes a man to think of the hereafter and to talk about it, too, more or less blasphemously. The noise is a cross between a loaded lumber wagon rolling downhill on a granite paved street and a steamboat whistle with bronchitis and the valve tied down.

"Friends of Pete's and others who were his friends until he got this whistle are now able to locate him with unfailing exactness. If the whistle sounds about as large as an ordinary boiler explosion they know he is at least ten miles away. If it is as loud as a Democratic convention on the fifth ballot, they know he is somewhere in the city. If, however, they hear a noise which sounds like a snare drum when you are locked up in a china closet with the player, they get bricks and wait patiently—for he is due around the corner in a few minutes. The contrivance is called a compressed air whistle, but there are those who say that it sounds more like compressed sheol."

Automobiles for An'arctic Exploration.

M. Henryk Arctowski, a member of the scientific staff of the Belgian Antarctic expedition of 1897-'99, which was the first to winter in the south polar regions, is actively interested in the new scheme of polar exploration as set forth in September at the Congress of Mons, in which King Leopold took such great interest and attended personally.

M. Arctowski has just visited London in order to confer with several geographical authorities on the possible outcome of the resolution taken at Mons. He proposes to begin the systematic exploration of the Antarctic regions by a preliminary circum-polar expedition which, organized in Belgium, would leave Antwerp next autumn, with the object of exploring the most unknown sections of the South Pole, in view of finding new lands and suitable places for the establishment of subsequent wintering stations.

The most interesting part of M. Arctowski's prospect is his idea of utilizing an automobile of special construction to penetrate into the interior of the Antarctic continent. He thinks that if this experiment were successful automobiles could be used on the inland ice to transport all the material necessary for the establishment of a far advanced station in the interior, whence further explorations could be made.

Two "Borrowers" Charged With Trespass.

For probably the first time on record a young man, or rather two of them, who "borrowed" an automobile without the owner's permission, have faced a court as a result. Both were employes of Whitefield's garage, in New Haven, Conn. They had a key to the establishment, and, after hours, returned and, "borrowing" the machine, went for a midnight lark.

As so often happens, they damaged the car, but, as does not usually occur, they were promptly haled to the City Court, charged with trespass and the wilful injury of property.

They pleaded guilty, and it was explained to the court that they had agreed to pay $100 for the damage to the car. The court held that as they had a key from the owner there was no trespass. He continued the cases for two months, remarking that the $100 the young men had agreed to pay was more than any fine he would have imposed on either charge.

In the course of the hearing the point was made that there is no law in Connecticut that makes it either a crime or misdemeanor to take an automobile without permission. If a man should take an automobile and offer it for sale, he would commit a theft, but to take a ride in a machine is not theft, if there is no intention to steal. There is a special statute in Connecticut that makes it illegal to take a horse, a bicycle or a boat without permission, but the law does not reach the motor vehicle.

Getting Even With the Judge.

"A farmer in Vineland, N. J., had a brief career as a motorist and has given it up," is the amusing tale of a veracious chronicler. "Some one in a neighboring town who had grown tired of his runabout sold it to the farmer in question for $26, good and lawful legal tender of the United States. It was of the vintage of 1901, which is a pretty old vintage in automobiles, and it looked as if it had seen considerable service. But it would run, and for a week the purchaser had more fun than he had had since he had his first attack of the mumps. Then went out on the public highways, where the deputy sheriffs lie in wait for the motorist, and there fell foul of a hard headed official who decided that he had exceeded the speed limit, took him before the local justice and had him fined $25. The farmer concluded that the machine was worth about that, so he made a deal with the judge and sold him the runabout for the amount of the fine. The farmer says he is satisfied, as he has had a dollar's worth of fun out of the machine; the justice smiles broadly as he drives to market in the car; the constable is sometimes taken for a ride."

When the Two Trucks Tugged.

Quite an interesting unsanctioned event was pulled off in Vernon street, New Haven, Conn., on Thursday morning of last week. The use of the words "pulled off" is conceded vulgar by authorities, but it is well applicable in the case in point. It was a tug of war between two motor trucks, a 20 horsepower Knox and a 24 horsepower Atlas. Fully two hundred persons watched the pulling contest, among whom were the directors of a local company before whom Driver A. E. Dennison was to have demonstrated the Knox truck.

Dennison was about to demonstrate the Knox truck when a driver on an Atlas came along and challenged Dennison to a tug of war. Dennison at first refused, but when the spectators jibed him consented. An inch rope was attached to the rear of each truck, and then at the signal both drivers threw on their power. As soon as the rope became taut it snapped in two under the strain. Two more ropes were obtained and the trucks once more harnessed together. This time the driver of the Atlas got the jump on his opponent, but Dennison threw on his power, and with the engines of the Atlas going at full speed the Knox drew the Atlas truck backward for thirty-five yards, when the Atlas driver shouted, "Enough!" During the struggle the tires of the Atlas car were smoking from the friction, and the macadamized roadway still bears the marks where the machine was pulled backward.

And This Occurred in the Quaker City!

The maddest woman on Market street yesterday morning was a woman in a swell Newmarket cloak and wearing a veil and a pair of automobile goggles, says a Philadelphia scribe. But neither the veil nor the goggles could conceal the annoyance her features expressed when she came from a store where she had been shopping and saw hanging from the front of her big red car, that must have cost at least $5,000, a painted sign reading: "For sale cheap; a bargain to-day, $2.65." A couple of boys on the curb were waiting to see what would happen when the owner of the automobile came along, and there was a crowd about also, wondering who was playing a joke. What that woman said was certainly amazing. Her language actually startled the most hardened who heard, and the boys who caused the trouble turned white and forgot to laugh at their little joke. The carriage man in front of the store said: "That woman can beat the devil himself when it comes to cussin'."

Municipal Ownership Idea in Chicago

Municipal automobiles may be provided for in Chicago's next Council appropriation bill if Commissioner Patterson and Alderman B. W. Snow have a voice in the matter. They very naturally think if all the city officials are provided with the new and approved means of locomotion a greater amount of work can be accomplished. Of course, aldermen perform a deal of the work that requires "running around" and automobiles will prove handy!

$675
1906
Four-Seated
Runabout

REO

The extra seat carries two people facing forward, and when not in use is folded down snugly out of the way. 8 h. p., 1000 pounds, 25 miles per hour.

5 Prizes out of 7.

In the New York Motor Club's great six-day economy test

The Reo 8 horse power Runabout (shown above) carried 4 passengers 682 miles for $3.81½ per passenger.

By this feat this car won two medals—**The Gold Medal** for all cars up to $1500 in price; and the **MacMurty Medal** for least ignition trouble, having none at all.

The Reo 'Bus with exactly the same horse-power as the Touring Car referred to below carried ten passengers 682 miles for $2.93 per passenger (including ferriage).

And won three prizes:—The **National Trophy** for Economy per passenger; the **W. J. P. Moore Trophy** for Economy per mile, including tire charges, which were only 4 3-10 cents; and the **Morgan Trophy** for the least gasoline per passenger, which cost only $1.60.

Thus 5 prizes out of 7 went to the splendid REO capacity and power.

WRITE FOR REO BOOK THAT TELLS WHY.

REO 1906 TOURING CAR, 16 h.p., 1,600 pounds, 90 inch wheel base, 5 passengers, side-door detachable tonneau, speed 35 miles per hour, $1250.

REO Motor Car Co., Sales Department, Lansing, Mich.
R. E. Olds, Pres. R. M. Owen, Sales Manager.

Agencies throughout the United States.

WHY
PREMIER CARS
Appeal to All Classes.

TO THE PROFESSIONAL MAN—Because of its simplicity.

TO THE BUSINESS MAN—Because of its readiness to go at all times.

TO THE REPAIR MAN—Because of its perfect accessibility to working parts.

TO ALL MEN—Because of its low cost of fuel and maintenance.

We have much data from drivers on this latter point; for instance, one writes us: "The total cost of my running this season—5000 recorded miles—is only a trifle over one cent per mile for the car—or 1-5th to 1-4 cent per mile per passenger—total for repairs, fuel, etc., excepting tires."

These are points to remember when purchasing a car.

"The air cooled season never ends."

Side Entrance Model - $1500 Runabout - $1250

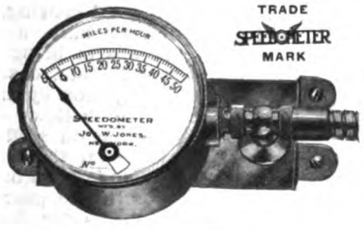
¶ The Metropolitan Police Department, at Washington, D.C., have used the Jones Speedometer as a positive means for timing the speeding automobilist, for several years. There isn't an officer in this squad who wouldn't testify as to the accuracy of the Speedometer.

¶ The Judge knows when the automobilist hasn't a Jones Speedometer on his car—that he hasn't any knowledge of his car's speed—and promptly says, "$100 or 30 days," or both.



¶ The Automobilist who to day doesn't include a Jones Speedometer in his list of accessories is eliminating two-thirds of the pleasures of automobiling—and is encouraging the officer of the law to make his arrest.

¶ Our Speedometer Bulletin has information concerning our Protection Tag and other interesting speed news. This will be sent free, if you'll write.

JONES SPEEDOMETER

100 West 32d Street, - NEW YORK.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

A TEN PASSENGER wagonette; sample car, 1905-1906 model; steam; price and description on application. THOMPSON AUTO CO., Olneyville Sq., Providence, R. I.

FOR SALE—40 horse power, 1905 up-to-date Thomas Flyer. Used for demonstrating purposes. Very best condition. A bargain. C. A. COEY & CO., 1323-1325 Michigan Ave., Chicago.

WAVERLY electric runabout of the type styled "Speed Wagon"; new this season and in perfect condition; batteries, thirty cells of 9 p. v.: buggy top. Apply to WM. A. TUCKER, 53 State St., Boston, Mass.

WANTED—A THOROUGHLY UP-TO-DATE FACTORY SUPERINTENDENT, WELL UP ON FOUR CYLINDER CONSTRUCTION, FOR LARGE, ESTABLISHED PLANT. GOOD SALARY AND EXCELLENT FUTURE. ENCLOSE REFERENCE AND SALARY DESIRED. X Y Z, CARE MOTOR WORLD.

VERY, VERY CHEAP—Orient 8 h. p. engine, with carburetor and muffler; Upton transmission; honeycombed radiator; circulating pump; Brown-Lipe steering outfit complete; front axle and wheels; Baldwin roller detachable chain; spark coil; all of above were bought by us new from manufacturers, and are practically new and perfect, having seen only about two months' service on an experimental machine. HENDERSON MFG. CO., Hampton, Ga.

RAMBLER SURREY TYPE I, 18 h. p., in good condition, extras; one shoe, three tubes and other extras; also full Cape top; cost over $1,500; good reason for selling; bottom price, $1,000 cash; will demonstrate. W. R. OLNEY, Oneida, N. Y.

CHAUFFEUR. Young man, 29 years old, desires position on Packard, F. I. A. T. or Mercedes; experience and reference. No Grafter, FRANK TASCHLEIN, 357 West 38th St., New York.

BARGAIN. 1904 Haynes-Apperson 15 h. p. opposed motor. Top curtains, aprons. 4 lamps, 2 extra tires with carrying case, magneto, run 1,000 miles. Just overhauled. $600. Would like offers cash or exchange. WM. DOBBS, Auburn, N. Y.

1905 MARION, 4 cylinders, detachable tonneau; seats 5; Fisk tires; list, $1,500; fine condition; immediate delivery, $1,000. F. S NEWCOMB, New London, Conn.

GRINDING SKATES, is profitable during the winter months. It is easy with one of my holders. Clamps any size skates, on or off shoes. Price, $5.00. C. R. ZACHARIAS, Eagle Hall Block, Asbury Park, N. J.

FOR SALE.

The Week's Patents.

803,584. Fluid-Pressure Power-Transmission Apparatus. John W. Hall, Brixton, England, Assignor to Hall's Transmission Gear Syndicate, Limited, London, England. Filed March 14, 1903. Serial No. 147,706.

Claim.—1. In a power-transmitting device the combinations of a shaft, extending entirely through the device, and a rotary casing, constituting the driving and driven members, a pressure-creating device, such as a pump, having one of its elements connected with the driven member and its coöperating element connected with the driving member, an adjuster in controllable communication with the pressure-creating device or pump and controlling the movement of the driven member with means for varying the relative capacities of the pressure-creating device or pump and the adjuster.

803,589. Antivibration Device for Vehicles. Edward V. Hartford, New York, N. Y. Filed October 1, 1904. Serial No. 226,863.

Claim.—1. In a vehicle, comprising running-gear, a suspended portion and elastic supporting means between said running gear and suspended portion, an antivibration device comprising non-elastic means for permitting of a limited free movement of the supporting means, but which operates to retard the recoil thereof beyond the limit of free movement, substantially as described.

803,593. Variable-Speed Mechanism. Ebenezer Hill, Norwalk, Conn. Filed February 17, 1905. Serial No. 246,059.

Claim.—1. A variable-speed mechanism having a shaft, a pulley loosely mounted directly on the shaft, four bevel-gears within the pulley, one gear being permanently fixed to the shaft, another being loose on the shaft, and the other two being mounted on the pulley and each meshing with both the fixed and loose gears, means for connecting the loose gear with the shaft, and means for holding the loose gear immovable and disconnected from the shaft, substantially as specified.

803,599. Rotary Engine. William F. Jungersen and John J. Fogh, Brooklyn, N. Y. Filed January 5, 1905. Serial No. 239,693.

Claim.—1. A rotary engine, comprising a casing, an irregularly-shaped chamber therein, an abutment rotatably mounted in the center of said chamber and bearing against the sides thereof and thereby dividing said chamber into a plurality of supplemental chambers, a piston slidably mounted in said chambers and extending on either or both sides thereof and bearing against the opposite surface of said first-named chamber and said supplemental chambers, a valve in communication with each of said supplemental chambers, an exhaust in communication with each of said supplemental chambers, and means for opeating said valves, substantially as shown and described.

803,606. Steering-Axle for Vehicles. Fred A. Law, Hartford, Conn., Assignor to Electric Vehicle Company, Jersey City, N. J., a Corporation of New Jersey. Filed May 16, 1902. Serial No. 107,609.

Claim.—1. A steering mechanism comprising a main body portion, vertical pivot members separately made and fixedly secured to said main body portion by one end only and having their other end unattached, axle members mounted upon said vertical pivots and readily removable over one end thereof, means for controlling the relative positions of said last-named axle members.

803,623. Explosion-Engine. Edward T. Pollard, London, England. Filed October 20, 1904. Serial No. 229,297.

Claim.—1. The combination of two explosion-cylinders, an expansion-cylinder, ports in the explosion-cylinders uncovered at the end of the outstroke, passages connecting the ports to the rear of the expansion-cylinder, and non-return valves in the passages, substantially as described.

803,659. Pneumatic Tire. Arthur S. Allen, Brookline, Mass. Filed November 12, 1904. Serial No. 232,412.

Claim.—1. A tire comprising a body of india-rubber containing a layer of intermeshed oppositely-wound united wire coils embedded therein, the coils crossing said body transversely of its length.

803,810. Speed-Changing Device. George A. Cutter, Nashua, N. H. Filed June 24, 1903. Serial No. 162,955.

Claim.—1. A speed-varying device comprising expansible pulleys having spherically-convex faces, the shafts on which said pulleys are mounted, and the belt connecting said pulleys, substantially as described.

803,989. Armored Tire. Clarington W. Caterson, Franklin Forks, Pa. Filed January 25, 1905. Serial No. 242,591.

Claim.—1. A pneumatic tire consisting of a tubular rubber body and an armor-strip embedded therein, said armor-strip having a substantially flat band with laterally-projecting curved wings conforming to the curvature of the side walls of said body, and a sheath enveloping said strip, the outer portion of said sheath being disposed at a distance from the outer face of said band whereby a space is formed therebetween, and a packing of a fibrous material in said space.

804,088. Pneumatic Tire. Manley H. Blakeslee, Buffalo, N. Y., Assignor of one-half to Roscoe D. Baker, Buffalo, N. Y. Filed December 1, 1904. Serial No. 235,068.

Claim.—1. A pneumatic tire having a series of inflatable sections or chambers, a common air-supply conduit communicating with all of the sections by individual passages, and a plurality of automatic valves each controlling one of said passages and operating to permit free communication between the sections and the supply-conduit in the normal inflated condition of the sections and to cut off communication between the conduit and the sections when one or more of the same become deflated by puncturing, substantially as set forth.

804,104. Friction-Clutch. Albert De Dion and Georges Bouton, Puteaux, France. Filed April 18, 1905. Serial No. 256,298.

Claim.—A friction-clutch having a contact-surface composed of alternations of metal and lubricating material, the lubricating material consisting in blocks of graphite or graphitic carbon inserted in the surface to be brought in contact, substantially as described.

12,399. Antivibration Device for Vehicles. Jules M. M. Truffault, Paris, France, Assignor of fifty-one one-hundredths to Edward V. Hartford and forty-nine one-hundredths to George H. Hartford, Orange, N. J. Filed January 10, 1905. Serial No. 240,511. Original No. 743,995, dated November 10, 1903.

Claim.—1. An antivibration device comprising a friction-disk having a peripheral flange and a flat interior surface, an arm rigidly attached to said disk and means on said arm for securing it to the frame of a vehicle, a second friction-disk concentric with said first disk, an arm rigidly attached to said last-mentioned disk and means on said arm for securing it to the running-gear of a vehicle, a washer seated within the recess formed by said flange and between the faces of said disks, a bolt rigidly attached to one of said disks and passing freely through an aperture in the other disk and means on said bolt for adjusting the disks relatively to each other, substantially as described.

12,402. Vehicle Tire. Herbert Lutz, Hamilton, Canada, Assignor of two-fifths to Benjamin Harris, Hamilton, Ontario, Canada. Filed July 10, 1905. Serial No. 269,135. Original No. 767,949, dated August 16, 1904.

Claim.—1. A tire for vehicles comprising inner and outer concentric series of elastic cushions or blocks, the outer edges of each of said blocks overhanging the body portion thereof, substantially as specified.

804,202. Elastic Wheel. Warnerus Borchers, Berlin, Germany. Fined Jan. 21, 1904. Serial No. 190,087.

Claim.—1. In an elastic wheel having two concentric rims, a hub, spokes connecting the same with the inner rim, universal joints secured to the inner and outer rims and a plurality of elastic links interposed between the inner and outer rim and connected to said joints.

804,212. Change-Speed Gearing. William R. Cary, Milwaukee, Wis. Filed March 6, 1905. Serial No. 248,451.

Claim.—1. In change-speed gearing the combination of two parallel shafts two sets of intermeshing gears, the gears of one set being fixed on one shaft and the gears of the other set being loosely mounted on the other shaft, clutches for severally locking the loose gears to the shaft on which they are mounted, clutch engaging devices to be operated by the power which turns the gearing, and a manually operated shifting device for setting any one of the clutch engaging devices in operative position, substantially as described.

804,263. Variable-Speed Gearing. Adolph Peteler, St. Louis, Mo. Filed Oct. 28, 1904. Serial No. 230,347.

Claim.—1. In a variable-speed gearing, the combination with a driving-shaft and a driven shaft, one of said shafts being hollow and having fluid-ports therein, castings on the hollow shaft having piston cylinders in communication with the hollow shaft through the fluid-ports, pistons in said cylinders, clutch members loose on the hollow shaft and gears carried thereby, gears on the other shaft and in mesh with the gears on the clutch members, and means for permitting fluid to enter the cylinders in one of the clutch members to the exclusion of the others to hold the gear-carrying clutch member non-rotatable with relation to the shaft; substantially as described.

804,284. Device for Removing the Sediment from Gasolene. Harold D. Waterhouse and Frederick W. Green, Quincy, Mass; said Green Assignor to said Waterhouse. Filed Dec. 3, 1904. Serial No. 235,335.

Claim.—1. A pipe-strainer comprising a casing having a vertical chamber, a horizontal outlet-pipe communicating with the top of said chamber, a hollow screw-plug provided with a closed end tapped into the bottom of said chamber, a wire screen interposed between said plug and said outlet and extending over the open end of said plug, an annular passage around said plug near the bottom of said chamber and communicating with the interior of said plug, and an inlet extending from a point near the top of said chamber and communicating therewith near the bottom thereof.

The Maxwell

PERFECTLY SIMPLE
SIMPLY
PERFECT

16 H. P. Touring Car
$1450

8 H. P. Tourabout
$780

THE CAR that made a perfect score in the Glidden Tour—1,004 miles without a single adjustment. No car at less than twice the price made **AS GOOD** a record. No car **AT ANY PRICE** did better.

THE CAR that won a victory over all cars costing from one to two thousand dollars in the "Climb to the Clouds" at Mt. Washington. Unlike some contestants, we did not have to send three cars to get one up, but sent the **SAME** car up **THREE TIMES.**

THE CAR whose regular stock 8 H. P. Runabout type won the race at Long Branch August 19, making four miles in 5 min. 33 sec., and defeating cars listed at several times the price.

The automobile that has done these things **MUST** be worthy of your consideration. Look at as many cars as you please, but don't buy before seeing the Maxwell.

The agency field is filling fast. If you contemplate applying for a Maxwell agency, better do it now.

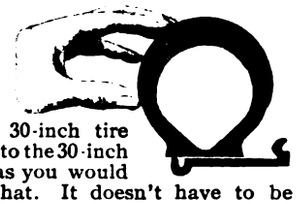
Why Goodyear Auto Tires Won't Creep

DID you ever try to force an inch tube over an inch and a quarter bar—or to put a pair of No. 7 gloves on a No. 8 hand?

You wouldn't be so foolish, would you?

But that's to all intents and purposes what the Automobile Man has to do every time he puts an ordinary tire on an ordinary rim. It's



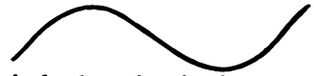
about as hard work as breaking into a bank, and he goes at it the same way, with a "jimmy" and other burglar's tools. Because a 30-inch wheel (for example) is really *31 inches* in diameter, when you consider the flange. So a 30-inch tire has to be forced over a 31-inch rim every time you put on a tire, or take it off.

It's a heart breaking job, even for a strong man, and it takes from half an hour to an hour each time you do it.

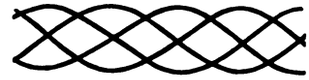
And after you have removed such a tire a few times, the base of the tire becomes stretched, and the fabric (used to strengthen it) becomes broken in places, until this tie becomes 31 inches in diameter instead of 30, a full inch larger that the face of your wheel. So you have to bolt it down, or it will creep, tear the valve out and cause all kinds of trouble. And even then you have to keep it pumped up continually as hard as it will stand.

Now the Goodyear Detachable Auto Tire can't creep, because, in the first place, it doesn't have to be *forced* on (if you use the Goodyear Universal Rim). The 30-inch tire slides right on to the 30-inch rim as easily as you would put on your hat. It doesn't have to be pried over a 31-inch flange.

And next, at the first stroke of the pump, the tire begins to grip the rim like grim death, because there is a mesh or tape of piano wire vulcanized clear around the tire on each side of the base.



When the tire is flat these wires are like this:



And each single wire like this:

The instant you begin to pump, this wire begins to shorten like this:

And when the tire is pumped up hard, the wire mesh is like this:

If you put a Goodyear Auto Tire on a wood rim, and pump it up hard, the pressure will be so great that the base will squeeze a ridge in the wood.

So the Goodyear Auto Tire need be only *half* inflated, and it will still have a firmer grip on the rim than it is possible to secure with plates and bolts. This, however, is only *just one* of the good points of this trouble-saving tire.

You will find other points in our "Good News Book." It is vitally interesting to every manufacturer, dealer or user, for it shows the way to perfect relief from Tire Troubles. It's FREE. Ask for it.

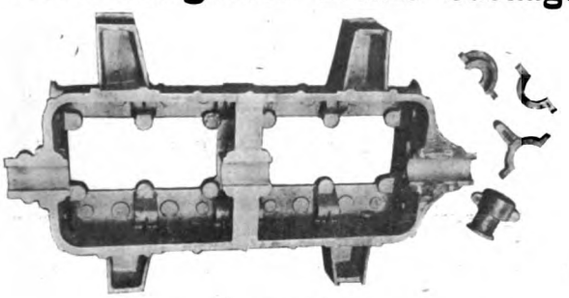
WE CAN MAKE POOR TOPS BUT DON'T

LONDON TOPS are correctly designed for each model car—are built in the best possible manner to stand the wear and tear a top is subjected to. Heavy bows, reinforced, stayed and cross stayed, padded to give proper shape, front and back stay straps, with or without joints.



The Best Possible in Top Construction

Each top has detachable Roll Front, Front Side, and Side and Rear Curtains, with ample celluloid lights—ready to attach to cars.

Do you know
Chas. T. Knisely?

Mr. Knisely manufactures automatic iron and copper window frames and the like, and incidentally runs an automobile.

Since the first of May Mr. K. has covered something like six thousand miles—mostly over country roads.

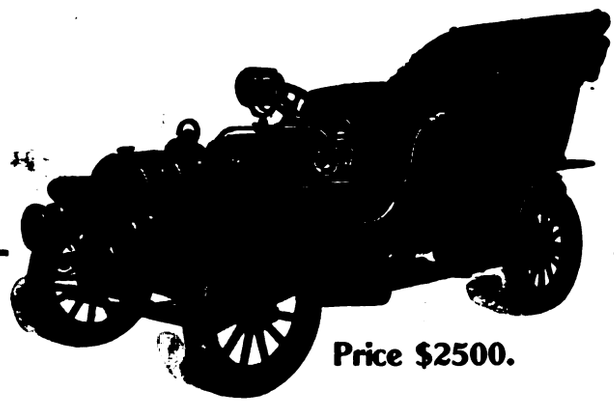
To be perfectly frank about it, he has not been entirely free from tire troubles.

He recollects distinctly that his tires have been punctured two—possibly three—times.

(Death and taxes and punctures are about equally hard to dodge.)

☞ **But aside from these unavoidable accidents he has suffered positively no tire inconvenience in all the six thousand miles.**

This is his own word for it.



And—like many another man who has had a similar experience—he uses MORGAN & WRIGHT ti

Locomobile

"EASILY THE BEST BUILT CAR IN AMERICA."

We announce two new styles for 1906, a 15-20 H.P. touring car, $3,000, and a 30-35 H. P. car, $5,000, both with complete touring equipment. These models are almost identical in design, contain the same carefully selected material, and are constructed with equal care throughout—the result of years of careful and consistent manufacture of the standard type of four-cylinder touring car. Locomobiles are fully equal in mechanical details and running qualities to the best imported cars but are especially designed for American Roads.

Type E
Locomobile
15-20 H.P.
$3000.
Top and Luggage Carrier extra.

SPECIFICATIONS OF 1906 MODELS.

Type "E" Locomobile—15-20 H. P.

PRICE, $3,000, with 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance seating 5; fitted with top irons; color and striping optional; top and luggage carrier extra.
MOTOR, 4-cylinder, 3¾ inch bore, 4½ inch stroke.
LUBRICATOR, large mechanical lubricator.
CARBURETER, automatic, with balanced throttle valve.
GOVERNOR, centrifugal type, prompt and positive in action.
IGNITION, make-and-break, with iridium contacts.
MAGNETO, low tension, our own design and manufacture.
ALUMINUM PAN, placed underneath the machinery.
CLUTCH, cone type with ample surface.
TRANSMISSION, 3 forward speeds and reverse.
DRIVE, double side chains.
DOUBLE UNIVERSAL JOINT, between clutch and transmission.
RUNNING BRAKE, double acting type, metal to metal.
EMERGENCY BRAKES, internal expansion, metal to metal.
COMBINED BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES, "I" section hand-welded axles.
TIRES, 32 inch x 4 inch on all four wheels.
WHEEL BASE, 93 inches.

Type "H" Locomobile—30-35 H. P.

PRICE, $5,000, with 5 brass lamps, horn, tire carrier, set of tools, extra parts, jack, lock box for tools and lubricants.
BODY, double side entrance, seating 5 to 7, fitted with top irons, color and striping optional; top and luggage carrier extra.
MOTOR, 4 cylinder, 4½ inch bore, 5½ inch stroke.
LUBRICATOR, large mechanical lubricator.
CARBURETER, automatic, with balanced throttle valve.
GOVERNOR, centrifugal type, prompt and positive in action.
IGNITION, make-and-break, with iridium contacts.
MAGNETO, low tension, our own design and manufacture.
ALUMINUM PAN, is placed underneath the machinery.
CLUTCH, cone type with ample surface.
TRANSMISSION, 3 forward speeds and reverse.
DRIVE, double side chains.
DOUBLE UNIVERSAL JOINT, between clutch and transmission.
RUNNING BRAKE, double acting type, metal to metal.
EMERGENCY BRAKES, internal expansion, metal to metal.
COMBINED BRAKE AND SPROCKET DRUM—Bolted to each rear wheel spoke.
AXLES, "I" section hand-welded axles.
TIRES, 34 inches x 4½ inches on all four wheels.
WHEEL BASE, 106 inches.

This AUTO TIRE has no BAD HABITS

It won't creep—it won't rim-cut—it won't come off the rim when run deflated, no tire bolts required to hold it on the rim—and you can take it off or put it back in 30 seconds, using nothing but the hands. And it's a Tire, besides, that's as resilient as a "soft" tire, and will outwear most "hard" tires.

Sounds like a fish story, doesn't it?

But it's a *fact*, nevertheless.

Barney Oldfield didn't believe it, either, but he does now.

We *showed* him—he saw with his own eyes—and now he uses the Goodyear Detachable Auto Tire with the Universal Rim in all his races.

He used this tire at the Boston meet on Sept. 9th, where he made five miles in 4:55 and a mile in :55 1-5—breaking the track record.

You ought to hear Barney's chaffeur sound the praises of the Goodyear Detachable to all who will listen to him—hear him tell how reliable it is—how it saves him time, trouble and worry and makes his position easy. He says he never thought it possible (before using the Goodyear) to embody all the good points a tire *ought* to have in one single tire.

We wish you could come with us to the factory or to one of our branch stores. Then you could see in no time for yourself just why and how these things are true. You can "see through" it all instantly when the tire is before you.

We'll try, however, to explain just *one point*, here.

Why the Goodyear Detachable Auto Tire is *Durable* and *Resilient* at the same time.

Look at the section of the Goodyear Tire in the center column. Notice the crescent shaped portion in solid black where the wear of the road comes. That's dense, firm rubber, as tough as rawhide—practically no wear out to it.

Now right underneath this is the remainder of the outer casing (shown in grey) which is made from pure para rubber, as resilient and springy as it is possible for rubber to be.

These two different kinds of rubber—the dense, tough composition, to take the wear, and the soft, elastic rubber, to make you ride easy—are made into one solid piece by a special process. You can't skin the two kinds of rubber apart with a knife. Try it if you doubt.

The dense rubber and the soft rubber together make a tire that's almost as durable as a *solid* tire, a tire difficult to puncture yet one which is as *resilient* as a man could reasonably ask.

Our "Good News Book" tells more about the good points of this trouble-saving tire. You ought to get it now, for the Goodyear Detachable Auto Tire with Universal Rim will be "the only tire" next season.

THE GOODYEAR TIRE & RUBBER COMPANY, Grove Street, Akron, Ohio

THE CELEBRATED BRAMPTON CHAINS

MADE FROM SELF-HARDENING STEEL

TWO PAIRS OF CHAINS IN 75,000 MILES.

EALING, LONDON, February 13, 1905.

BRAMPTON BROS., Ltd.

Dear Sirs:—We are using a Napier Car for conveying our "RISIN' SUN" METAL POLISH throughout ENGLAND, calling at the various stations en route to replenish the loads. We estimate the car has now covered a distance of 75,000 miles in about three years and five months, running daily with scarcely any delay, the only renewals worth mentioning were Brasses to Pistons, Chains only once (BRAMPTON'S), tyres frequently, CONNOLLY'S large solids have proved the most durable.

Yours faithfully, JOHN EDWARD SHARP & SON.

YOUR AMERICAN CAR

can be and will be fitted with the celebrated Brampton chain if you order it that way, and it won't cost you or the manufacturer any more than an inferior chain the kind that breaks and stretches and have to be replaced every few hundred miles. All standard sizes in stock to fit American and Foreign cars.

We are Sole United States Agents for this Line of Chains, and are Ready to Quote Manufacturers Interesting Prices on American Standard Sizes.

Catalogue Mailed on Request.

No More Borrowing Cars Without Owner's Permission

PATENT APPLIED FOR.

The Hill Lock Valve

(here shown), is a new device and a good one. It is connected at any convenient place in the gasolene pipe and when locked and the key withdrawn prevents the gasolene from flowing to the carburettor and consequently the engine cannot be started. The key cannot be taken from the lock until the gasolene supply is entirely shut off—when shut off keep the key in your pocket. Impossible for anyone to steal your car. Your fuel supply is **locked,** but your car can be pushed to the wash-stand for cleaning, or into the street in case of fire. It is a small device made entirely of brass and turned with a "special key"—no two keys are alike. The lock is of the finest grade, it has five tumblers and cannot be picked or opened without the "right" key. Three keys are furnished with each lock. The locks are perfectly tight, being tested by gasolene under a pressure of one hundred pounds. It is made for all sizes of pipe from the smallest motor-cycle or launch to the most powerful touring car. Price, $5.00. **Special price to Supply Houses and Automobile Manufacturers.** Apply to your supplyman or garage. If not found in stock, address

AN AFFIDAVIT THAT SPEAKS VOLUMES:

"Every Stock Car Guaranteed to Show Sixty Miles an Hour Before Leaving the Shops."—E. R. THOMAS.

THOMAS

Can any praise of ours compare with the eloquent testimony concerning the 1906 Thomas contained in this remarkable affidavit?

BUFFALO, N. Y., Nov. 10, 1905.

This is to certify, that we, the undersigned, this day rode at the rate of 60 miles per hour with five passengers over average roads, maintaining a speed continuously in regular stock model 1906 Thomas touring car, and went up a 14 per cent. grade with five people on the high speed and on very bad roads, increasing the speed all the way up the hill until we reached 40 miles per hour at the top.

The car is exceedingly smooth and quiet in operation, and the clutch is extraordinarily sweet and effective.

This is the only American built stock car that within our knowledge has made 60 miles per hour on ordinary roads, even without passengers.

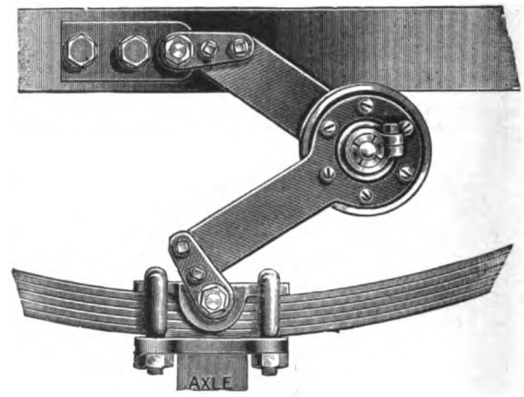
An Investigation of GOODRICH TIRES

Mr. E. Shirts, cashier of the Citizens National Bank, Noblesville, Ind., after using a set of Goodrich Tires through the year 1904 and all of 1905 up to date, without a repair of any kind, decided to take off the tires for examination just to satisfy his curiosity. All he found was Goodrich Rubber and Goodrich Fabric perfectly united and looking just as good as new. His letter:

"In the spring of 1904 I purchased a Cadillac automobile, Model B, equipped with Goodrich Tires 3 in. x 30 in. I used those tires all the season of 1904 and all of this season without a repair of any kind, not a single puncture, and the tires look as good as new with the exception that the treads are flattened down some. I have had such remarkable success with them that a few weeks ago I took the front ones off to see what they were made of, and I found them in perfect condition, not even rim-rusted.

I have driven my car every day that was fit to be out with my family and have kept them busy both seasons and my experience with them has been one round of pleasure."

THE BAILEY "WON'T SLIP TIRE." Regular Goodrich construction, but provided with the Bailey "Won't Slip" Tread. Prevents slipping, slewing or skidding.



Rims branded in the channel with this copyright mark have been inspected and pronounced perfect. We guarantee our tires only on rims so branded.

TRUFFAULT-HARTFORD SUSPENSION

RESULTS OF VANDERBILT ELIMINATION CONTEST

On Long Island Course. Sat., Sept. 23, Average Time, Almost 57 Miles per Hour.

The cars of these two leaders were equipped with the TRUFFAULT-HARTFORD SUSPENSIONS, which enabled them to win. Only 59 seconds separated them.

1st. DINGLEY, (Pope-Toledo, 60 H.P.) 2 Hours, 50 Seconds.
2d. TRACY, (Locomobile, 90 H.P.) 2 Hours, 1 Minute, 49 Seconds.

The third car ran 19 minutes behind the leader

AND WAS WITHOUT THE TRUFFAULT-HARTFORD SUSPENSIONS

Racing or Touring, if you want to Finish Among the Leaders Equip Your Car with

The Incomparable WHITE

The Car for Service.

Above is shown the chassis of the Model "F" White car which we are now delivering with touring car, runabout, limousine, victoria and landaulet bodies.

Steam power as utilized in the White car, possesses unique advantages. There is absolutely no noise, no odor, no vibration and the speed of the car is controlled entirely by throttle. There is an ever-present reserve of power which is often found most useful.

The White steam generator is totally unlike any other steam-making devise ever designed. To illustrate the radical difference, we might point out that in our generator the water is at the top and the steam at the bottom. In every other type of boiler, the steam is at the top and the water at the bottom. The safety, simplicity and reliability of the system is demonstrated by the performance of the thousands of White cars now in use.

A MILD COMPARISON

A comparison of the record made by the "HAYNES" car in the elimination race for the Vanderbilt cup, with that of far more powerful cars that were allowed to enter the race is

—most interesting

Get a record of the two events—

—and compare

Put the "HAYNES" record in the trials beside that of some of the cars that were allowed to enter the real race—

—and compare.

Study what the "HAYNES" did, and what some of the others DIDN'T DO—

—and compare.

A few LIVE Agents wanted in a few localities. WRITE QUICK for particulars.

We are booking orders for exact duplicates of our Vanderbilt entry in the order of their receipt.
